42.80K Optical beam modulators

106855 Two-dimensional magneto-optic spatial light modulator for signal processing. W.E.Ross (Litton Data Systems, Van Nuys, CA, USA), D.Psaltis, R.H.Anderson.
Opt. Eng. (USA), vol.22, no.4, p.485-90 (July-Aug. 1983).
This electrically alterable magneto-optic device can be used as a two-dimensional spatial light modulator in an optical image processor or a display system. A thin magnetic garnet film is epitaxially deposited on a transparent nonmagnetic garnet substrate in the manner of magnetic bubble memory films. Semiconductor photolithographic techniques are used to etch the film into a two-dimensional array of mesas and to deposit X-Y drive lines for matrix-addressed current switching of the mesa magnetization. Electromagnetic switching provides higher speed switching than a previously reported thermal switching method. The axis of polarization of polarized light transmitted through the film is rotated by the Faraday effect in opposite directions where opposite magnetic states have been written, and a polarization analyzer converts this effect into image brightness modulation. The resulting high speed random access light modulator is applicable to all three planes of the classic coherent three-plane correlator. Although the basic effect is binary, there are at least four possible configurations which achieve gray scale rendition. (8 refs.)

106856 Frequency shifting of light by means of two phase modulators in tandem. T.Tudor, I.Legrand, I.Winkler, M.Ciobanu (Faculty of Phys., Univ. of Bucharest, Bucharest, Rumania).
Rev. Roum. Phys. (Rumania), vol.28, no.4, p.343-50 (1983).
Analysis of the spectral structure of the light modulated by means of an electrooptic device which uses two phase modulators in tandem is carried out. The matrix treatment of this modulator and the three-dimensional vector diagram of the modulated light are presented. The conditions in which the modulator acts as a frequency translator are experimented. (10 refs.)

42.80L Optical waveguides

(for fibre optical waveguides, see 42.80M)

106857 Light propagation along periodic metal-dielectric layers. S.Kawakami (Res. Inst. of Electrical Communication, Tohoku Univ., Sendai, Japan).
Appl. Opt. (USA), vol.22, no.16, p.2426-8 (15 Aug. 1983).
Analysis and experiments on TE and TM waves along periodically laminated metal-dielectric layers are described; the waves propagate parallel to the layers. Aluminum (Al) and silica (SiO_2) are chosen as the metal and the dielectric, respectively. The author finds that the attenuation for TE waves is much higher than that for TM waves. Typically, α_{TE}/α_{TM} ranges from 10^3 to 10^4. Thus, an optical polarizer can be made in a multilayer structure. (6 refs.)

106858 Double ion exchanged chirp grating lens in lithium niobate waveguides. C.Warren, S.Forouhar, W.S.C.Chang (Dept. of Electrical Engng. & Computer Sci., Univ. of California, San Diego, La Jolla, CA, USA), S.K.Kao.
Appl. Phys. Lett. (USA), vol.43, no.5, p.424-6 (1 Sept. 1983).
An integrated optical chirped grating lens has been produced which exhbits high throughput efficiency (75%) and large angular field of view (3°). The waveguide substrate is x-cut lithium niobate, and ion exchange in benzoic acid is the method using for making the lens and the waveguide. (6 refs.)

106859 Fabrication of germanium-coated nickel hollow waveguides for infrared transmission. M.Miyagi, A.Hongo, Y.Aizawa, S.Kawakami (Res. Inst. of Electrical Communication, Tohoku Univ., Sendai, Japan).
Appl. Phys. Lett. (USA), vol.43, no.5, p.430-2 (1 Sept. 1983).
Circular hollow nickel waveguides with an inner germanium layer are fabricated by using a method based on RF sputtering, plating, and etching techniques. Transmission losses less than 0.5 dB are achieved incuding launching losses for straight waveguides with 1.5 mm$\phi\times$1 m at 10.6-μm wavelength. Bending losses of the waveguides are also examined. (12 refs.)

106860 The effect of axial gradient index lens. Chen Yaosheng (Xian Inst. of Optics & Fine Mech., Acad. Sinica, Beijing, China).
Acta Opt. Sin. (China), vol.3, no.4, p.374-9 (1983). In Chinese.
Presents a derivation of the locus equation for a rectangular waveguide for which the index distribution function is $n_{(x)}=n_0(1-1/2\ Ax^2)$. The locus of light rays can be described with a logarithmic function as the incidence plane is the central plane having refractive index n_0, and the locus of light rays can be indicated with an arc tangent function. When the tangential plane crosses the n_0 plane, the locus of paraxial rays located in the tangential plane is a well-known sinusoidal function. According to the locus equation, this waveguide has a function similar to a parallel plate or divergent lens or cylindrical lens. When it is used as parallel plate, the waveguide offers much larger displacement than that given by a parallel plate made of homogenous medium. As a divergent lens, the waveguide cannot be used as an image-forming element, because it only acts when light rays have a certain angle with the optical axis. The image-forming feature depends on the distribution constant A, the central refraction index n_0 and the thickness z_0. Thus, the locus line may be located in the outside or inside or at the end of the medium. The waveguide may be used in optical systems. Emphasis is placed on deriving the locus equation of light ray motion in the inside of the medium according to the eikonal equation. (4 refs.)

106861 Waveguide properties of gradient periodic fiber lightguides. P.M.Kolesnikov, I.P.Rudenko (A.V. Lykov Inst. of Heat & Mass Transfer, Acad. of Sci., Minsk, Belorussian SSR).
J. Eng. Phys. (USA), vol.44, no.1, p.109-13 (Jan. 1983). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.44, no.1, p.129-35 (Jan. 1983). [received: Sept. 1983]
Propagation of lower surface waves is studied in gradient fibers with longitudinal additive inhomogeneity. (19 refs.)

106862 Diffraction of the surface light wave in a planar surface-acoustic-wave lightguide. V.N.Parygin, N.S.Tankovski (Dept. of Phys. of Oscillations, Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.6, p.55-9 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.6, p.48-52 (1982).
The authors formulate a general equation for the interaction of light in the planar surface-acoustic-wave lightguide and obtain a solution of this equation which determines the intensity of light in all possible modes and diffraction orders. An analogy is shown between the diffraction of light in a multi-mode lightguide and in an anisotropic medium. (3 refs.)

106863 The beam propagation method: an analysis of its applicability. L.Thylen (Telefonaktiebolaget L.M. Ericsson, Stockholm, Sweden).
Opt. & Quantum Electron. (GB), vol.15, no.5, p.433-9 (Sept. 1983).
Simple quantitative conditions for the applicability of the beam propagation method (BPM) in isotropic and anisotropic media are given. These conditions are derived using the operator formalism employed in the BPM in its conventional formulation. The basic limitations of the BPM are highlighted at the same time. (10 refs.)

106864 Optical waveguides in $LiTaO_3$ formed by proton exchange. W.B.Spillman,Jr., N.A.Sanford, R.A.Soref (Sperry Res. Center, Sudbury, MA, USA).
Opt. Lett. (USA), vol.8, no.9, p.497-8 (Sept. 1983).
The authors describe the fabrication of optical waveguides in $LiTaO_3$ using proton exchange in hot benzoic acid. All specimens analyzed were X cut. An increase in surface extraordinary index of $\sim$0.14 has been observed for samples exchanged for 3 h at a melt temperature of 249°C. No change was observed in the ordinary index. Waveguide fabrication was facilitated by further baking the samples for an extended period of time at a temperature hotter than the acid melt. The latter technique also served to minimize the surface damage that is characteristic of acid baths exceeding roughly 4 h. The depth of proton exchange in X-cut $LiTaO_3$ appears to be considerably less than would be the case for X-cut $LiNbO_3$ under the same conditions. (5 refs.)

106865 Expressions for the coupling coefficient of a rectangular-waveguide directional coupler. M.Kuznetsov (Dept. of Electrical Engng. & Computer Sci., MIT, Cambridge, MA, USA).
Opt. Lett. (USA), vol.8, no.9, p.499-501 (Sept. 1983).
More-accurate expressions are obtained for the coupling coefficient of the dielectric rectangular-waveguide directional coupler. The previous expressions may overestimate the coupling coefficient by as much as a factor of 2 in some cases of interest. (7 refs.)

106866 Optical waveguide components in organic photochromic materials. I.Bennion (Allen Clark Res. Centre, Plessey Res. (Caswell), Caswell.Ltd.,England), A.G.Hallam, W.J.Stewart.
Radio & Electron. Eng. (GB), vol.53, no.9, p.313-20 (Sept. 1983).
The principles and techniques for preparing and using photochromic waveguide passive components for fibre optics are described. The sandwiched layer is considered to have a robust format in which fibre-to-waveguide alignment is fairly easy and reliable. (no refs.)

106867 Waveguide light modulators using the Keldysh-Franz effect in gallium arsenide. A.V.Maksimov, A.N.Blagodarov, N.A.Nagovitsyn, V.Ya.Kunin, V.I.Fomichev (M.I. Kalinin Polytech. Inst., Leningrad, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.243-5 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.392-4 (Feb. 1983). [received: Sept. 1983]
An important task in designing integrated optical systems is to develop waveguide light modulators which are fast and compact. Of particular promise in this regard is the use of the Keldysh-Franz effect (electroabsorption) in GaAs to directly modulate the emission intensity of lasers and light-emitting diodes fabricated using GaAs. The authors study electroabsorption in plane waveguides with epitaxial $(n-n^+)$ GaAs structures. (6 refs.)

106868 Phase matched optical dielectric waveguide using the artificial anisotropic structure. T.Mizumoto, Y.Naito (Faculty of Engng., Tokyo Inst. of Technol., Tokyo, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.J66C, no.6, p.454-61 (June 1983). In Japanese.
The authors propose a new phase matching technique using an artificial anisotropic structure. The proposed structure, which does not require an optical anisotropic crystal, is constructed with a dielectric slab waveguide loaded by dielectric strips of appropriate dimensions. The propagation constants of *Ex* and *Ey* modes of this waveguide are calculated by a rigorous numerical analysis based on the mode matching method The phase matching conditions are shown. The authors also fabricate the artificial anisotropic dielectric waveguide to confirm the function of the proposed structure experimentally. A thin film nonreciprocal mode converter and/or isolator may be realized by this phase matching technique. (9 refs.)

106869 Multi-glass-rod optical-fiber splicers and connectors made by drawing technique. S.Nagasawa, H.Murata (Ibaraki Electrical Communication Lab., NTT, Ibaraki, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Sect. E (Japan), vol.E66, no.5, p.305-12 (May 1983).
New splicers and connectors for multimode fibers have been fabricated. They contain precision multi-glass-rod arrangement, made by drawing, for aligning the fibers. In the multirod fabrication, the rod deformation of pyrex glass due to fusing is less than 1% in the rod array direction, in the 900-1000°C heating temperature range. The small deformation of 1% has no effect on splicing loss and fiber setting on the fabricated grooves. The multirod arrangement exhibits about 1 μm fabrication precision, because of the scaling down effect due to the drawing process. The splicers using a linear-multi-glass-rod arrangement exhibit 0.1 dB average splicing losses and slight loss fluctuation, less than 0.05 dB, in the $-20°C-+60°C$ temperature range. The connectors using a polygonal-multi-glass-rod arrangement exhibit 0.2 dB average connecting losses with index matching and 3.5 μm average off-axes. The splicers and connectors are potentially low in cost. (9 refs.)

106870 Reflected light in the coupling of semiconductor lasers with tapered hemispherical end fibers. H.Kuwahara, Y.Onoda, M.Goto, T.Nakagami (Fujitsu Labs. Ltd., Kawasaki, Japan).
Appl. Opt. (USA), vol.22, no.17, p.2732-8 (1983).
The amount of reflected light fed back in the coupling of semiconductor lasers and tapered hemispherical-end (TH) fiber is estimated. Reflection from incident hemisphere is estimated to be below -50 dB, from the loss in the coupling between the laser and its virtual image. For multimode TH fiber reflection of backward-propagating light from connections can be reduced to below -50 dB by an $\sim$10-μm lateral displacement parallel to the junction plane; there is a small penalty in forward-coupling efficiency. The reduction of reflection is confirmed by measuring relative intensity noise of coupled laser light. (10 refs.)

106871 Optical loss increase of phosphor-doped silica fiber at high temperature in the long wavelength region. N.Uesugi, T.Kuwabara, Y.Koyamada, Y.Ishida, N.Uchida (Ibaraki Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Ibaraki-ken, Japan).
Appl. Phys. Lett. (USA), vol.43, no.4, p.327-8 (15 Aug. 1983).
The wavelength-dependent loss increase in the long wavelength region is revealed for phosphor-doped silica fiber at a high temperature around 200°C. The loss increases around 1.3 μm and becomes larger for longer wavelength regions. The loss increase is suppressed by reducing P_2O_5 dopant concentration. The overtone absorption of Ge-OH at 1.41 μm as well as that of Si-OH at 1.39 μm also increases markedly. The possible origin of the loss increase is discussed. (10 refs.)

106872 The development of optical communication. W.A.Gambling (Univ. of Southampton, Southampton, England).
J. Electr. & Electron. Eng. Aust. (Australia), vol.3, no.2, p.80-5 (June 1983).
A description is given of the requirements which led to the need for increased bandwidth in communication systems, together with an outline of the early attempts at optical communication, which resulted in optical fibre waveguides. The various potential optical communication systems and their microwave equivalents are compared. The properties of optical fibres are reviewed and comparisons with coaxial and microwave relay systems presented. Existing optical fibre systems are comparatively crude and possible future developments are discussed. (no refs.)

106873 Absorption losses and thermal diffusivity of optical fibers investigated by photothermal method: theory and experiments. D.Chardon, S.J.Huard (Lab. d'Experiences Fondamentales en Optique, Centre Univ. d'Orsay, Orsay, France).
Can. J. Phys. (Canada), vol.61, no.9, p.1334-46 (Sept. 1983).
Both the absorption coefficient and the thermal diffusivity of an optical fiber have been measured using photothermal methods: photoacoustics (PA) and photothermal deflection (PD). The amplitude of the photothermal signal is proportional to the heat density generated in the fiber core. This in turn is proportional to the light absorption coefficient β. Thus, these techniques allow one to separate the absorption and Rayleigh scattering losses. The results obtained by the two methods are in agreement. A threshold value of 10 dB km^{-1} mW has been determined experimentally. In both cases, the device is calibrated by replacing the fiber with a heated electric wire. Moreover, the heat must diffuse from the core to the gas so that when the light is modulated, a phase delay appears. A study of phase delay versus modulation frequency gives the thermal diffusivity of the fiber. This is required in order to improve fiber sensors. Theoretically, the cylindrical geometry of the sample permits simple calculations. The thermoelastic equations in solids and coupled thermodynamic ones in the gas have been solved without neglecting viscosity effects. Noting that silica is almost unexpansible, an algebraic expression of the signal has been obtained without any assumptions on the gas transformation processes. Finally, the PA and PD techniques are compared and some extensions are presented. (23 refs.)

106874 Very low-loss and highly reproducible optical fibres by a pressurized MCVD method. E.Modone, G.Parisi, G.Roba (CSELT, Torino, Italy).
CSELT Rapp. Tec. (Italy), vol.11, no.4, p.283-7 (Aug. 1983).
Very low-loss fibres have been obtained by a pressurized MCVD-method (modified chemical vapour deposition). The minimum loss is 0.35 dB/km at 1.58 μm wavelength for a high numerical aperture (NA=0.23) graded-index optical fibre. The improvement is based on a fluid-dynamic control of preform inner pressure and diameter, and is obtained by a feedback loop between a pressurizing apparatus and a mass flow controller of a gas parallel line. By preform pressurizing, pure silica clad and germania-doped silica core optical fibres have been realized with very high optical and geometrical reproducibility: minimum attenuation values in 0.35-0.55 dB/km range at 1.5-1.6 μm wavelengths; circularity and core/cladding concentricity with errors smaller than 1%. (13 refs.)

106875 Multiquartic approximation in single-mode optical fibres. G.Coppa, P.Di Vita (CSELT, Torino, Italy).
CSELT Rapp. Tec. (Italy), vol.11, no.4, p.289-91 (Aug. 1983).
A new stratification method based on the approximation of the actual index profile of the fibre by means of a set of quartic curves is proposed. The method allows one to deduce accurately the propagation characteristics in a small calculation time, particularly for fibres with non-monotonic index profiles. (6 refs.)

106876 Fibre-optic gyroscope. V.N.Saxena (Inst. of Armament Technol., Pune, India).
Def. Sci. J. (India), vol.33, no.2, p.177-81 (April 1983). [received: Aug. 1983]
Comparative study of mechanical, ring-laser and fibre-optic gyroscopes has been made. The single mode fibre-optic gyroscope having a large number of turns of the optical fibre in the spool, replacing *He-Ne* gas laser by a *GaAs* laser diode, thereby reducing the noise level, and using fully integrated fibre-optics, works out to be the final analysis, for safe navigation and homing of the guided missiles. (9 refs.)

106877 Theory of multiplicative noise caused by coupling loss and amplitude vector rotation in optical communication channels. O.Hirota (Dept. of Phys. Electronics, Tokyo Inst. of Technol., Tokyo, Japan), J.Toda.
IEEE Trans. Commun. (USA), vol.COM-31, no.8, p.992-9 (Aug. 1983).
From a general optical channel model, it is shown that the coupling loss intensity noise generated at connections of optical channels is caused by amplitude vector rotation and its dependency upon the coupling coefficient. The shape of the polarization is not important. This noise becomes multiplicative noise so that the noise disturbs signals directly even if fluctuations of rotation of the amplitude vector are of low frequency. Detailed spectral properties and SNR are given for this type of noise, and the existence of a lower bound of SNR is shown. The coupling loss intensity noise becomes serious in the coupling of fibers and optical circuits, while it will not be important for the splicing of fibers. (21 refs.)

106878 Combined reciprocal and non-reciprocal birefringence in optical monomode fibres. V.Annovazzi-Lodi, S.Donati (Istituto di Elettronica e Comunicazioni Elettriche, Univ. di Pavia, Pavia, Italy).
Opt. & Quantum Electron. (GB), vol.15, no.5, p.381-8 (Sept. 1983).
The authors analyse the overall birefringence which arises from the combined effects of Faraday rotation (non-reciprocal) and bending stress (reciprocal) applied to a monomode optical fibre loop. The theory is substantiated by numerical evaluations and appropriate experimental data are reported. These indicate how it is possible to build non-reciprocal birefringent components, i.e. rotators and isolators by means of monomode coils. (15 refs.)

106879 A method of calculating the efficiency for coupling light power from a LED into an optical fibre by use of a sphere lens. C.Heinz (Lehrstuhl fur Tech. Elektronik, Tech. Univ. Munchen, Munchen, Germany).
Opt. & Quantum Electron. (GB), vol.15, no.5, p.389-96 (Sept. 1983).
The use of sphere lenses of high refractive index material to improve the coupling efficiency between a light-emitting diode and an optical fibre is well known. A general method of calculating the coupling efficiency for such systems is described. The mathematical model is based on analytical geometry in vector notation. Experimental results obtained with GaAlAs-LEDs and a step-index fibre are compared with the data from the theoretical evaluations. (6 refs.)

106880 Bandwidth of multimode fibres with random fluctuation in the index profile: a Monte Carlo approach. V.Rizzoli, C.G.Someda (Istituto di Elettronica, Univ. di Bologna, Bologna, Italy).
Opt. & Quantum Electron. (GB), vol.15, no.5, p.407-17 (Sept. 1983).
Random variations of the index profile along the length of a multimode fibre are analyzed by means of a Monte-Carlo technique, within the framework of the WKBJ approximation, assuming linear profile dispersion. Previous results (concerning fibres with deterministic profile variations) would suggest that very broad bandwidths could be obtained even in the presence of strong deviation from uniformity, with a suitable choice of the average profile. On the contrary, the authors' analysis shows that similar results are obtained only under restrictive assumptions. In particular, if the random fluctuations are specified in terms of their RMS deviation, then the probability of getting a broad bandwidth is always significantly less than unity, no matter how accurate the choice of the average profile. (8 refs.)

106881 Calculation of equivalent step-index parameters for single-mode fibres. M.Fox (BICC Res. & Engng. Ltd., London, England).
Opt. & Quantum Electron. (GB), vol.15, no.5, p.451-5 (Sept. 1983).
Various methods have been used to calculate wavelength-independent equivalent step-index values of core diameter and relative refractive index difference for a non-step-index fibre. The discrepancies in the results indicate that this system of fibre description should not be used without an express statement of the mode of calculation. (15 refs.)

106882 Axis-alignment method for arc-fusion splice of single-mode fiber using a beam splitter. K.Imon, M.Tokuda (Ibaraki Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Ibaraki-ken, Japan).
Opt. Lett. (USA), vol.8, no.9, p.502-3 (Sept. 1983).
A new axis-alignment method for single-mode fibers is proposed. To align core axes of the fibers to be spliced light beams are excited by bending the fibers near the splice point; the fiber end faces are observed through a beam splitter. An average splice loss of 0.09 dB is attained. (5 refs.)

106883 Electron microprobe analysis of a glass fibre.
Philips Tech. Rev. (Netherlands), vol.40, no.11-12, p.349 (1982).
To determine whether glass fibres meet the requirements for optical communication it is necessary to use sensitive methods of analysis such as electron microprobe analysis. The result of the analysis of a graded-index optical fibre made by the double-crucible system is described. The graded index is produced during glass transport in the double crucible by diffusion of Ca^{++} ions towards the cladding and diffusion of Mg^{++} ions towards the core. To determine how far the diffusion process has proceeded, the glass fibre is scanned radially in steps of about 1 μm by an electron beam with a spot diameter of about 1 μm. The electron bombardment causes the material to emit X-rays. (3 refs.)

106884 Application of the Ambartsumyan invariance principle to study of lengthy light guides with random inhomogeneities. M.Kh.Zakhar-Itkin (All-Union Sci.-Res. Inst. of Electrical Energy, USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.11, p.928-32 (Nov. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.11, p.1296-301 (Nov. 1982). [received: Sept. 1983]
A method is proposed for statistical experiments on short segments of an optical fibre to determine the coefficients in the expressions relating the probability distribution of power scattered by the light guide over modes to the distribution of power exciting the light guide over modes. (6 refs.)

106885 Propagation of a surface wave along a dielectric waveguide with an abrupt change of parameters. I. Solution by the factoring method. A.B.Manenkov (Inst. of Phys. Problems, Acad. of Sci., USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.11, p.954-60 (Nov. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.11, p.1329-36 (Nov. 1982). [received: Sept. 1983]
The diffraction of a surface wave by abrupt irregularities of a thin anisotropic waveguide optical fibre is investigated by means of a spectral expansion. The cases of wave scattering by a small change in diameter and at the open end of a semidefinite waveguide are analyzed in detail. (14 refs.)

106886 From optical fibre to the complete system. I. Mechanics of attenuation in optical fibres. R.A.Ares, J.L.Tondi Resta.
Rev. Telegr. Electron. (Argentina), vol.71, no.839, p.261-4 (April 1983). In Spanish.
Begins a series in which the whole subject of optical fibre technology is to be treated. Discusses the nature and properties of glass and the mechanisms by which optical signals in glass fibres are attenuated, which are mainly those due to the nature of the glass itself, to inhomogeneities, to bending of the fibre and to imperfections in the fibre surface due to mechanical damage, chemical action and ageing. (6 refs.) *C.J.O.G.*

106887 The transfer factor of an optical fiber. G.I.Gordon, I.I.Teumin.
Telecommun. & Radio Eng. Part 1 (USA), vol.36, no.8, p.5-8 (Aug. 1982). Translation of: *Elektrosvyaz (USSR)*, vol.36, no.8, p.12-13 (Aug. 1982).
In optical-cable communication systems the signals are transmitted by modulating the power of the optical radiation. Therefore, an optical cable (OC) should have the complex modulated-power transfer factor. This factor contains two characteristics. One is the amplitude modulation-frequency characteristic which can be interpreted as the modulus of the complex transfer factor of the optical radiation power, modulated by a harmonic signal, expressed as a function of the modulation frequency. The second characteristic is the phase modulation-frequency characteristic, which is the phase of the complex transfer factor of the power envelope of the optical radiation modulated by a harmonic signal, expressed as a function of frequency. These characteristics can be used as secondary OC parameters which determine its potential ability to transmit the required volume of information, or they can be used as initial information required to design lines and construct correctors that improve the frequency response of the OC. (7 refs.)

106888 A method of estimating signal propagation time in an optical cable. M.D.Kontorov.
Telecommun. & Radio Eng. Part 1 (USA), vol.36, no.8, p.9-11 (Aug. 1982). Translation of: *Elektrosvyaz (USSR)*, vol.36, no.8, p.14-15 (Aug. 1982).
Discusses an exact method of measuring the signal propagation time in an optical cable, using the Einstein method to synchronize such devices, and also proposes a method of calculating the measurement errors. (3 refs.)

106889 An optical directional coupler. Yu.A.Baklunov, P.A.Mishnayevskiy, P.P.Ovvyan.
Telecommun. & Radio Eng. Part 1 (USA), vol.36, no.8, p.12-14 (Aug. 1982). Translation of: *Elektrosvyaz (USSR)*, vol.36, no.8, p.16-18 (Aug. 1982).
The authors consider a coupler structure consisting of two meshing biconical cones, constructed from two-layer fibers. The operation of this coupler is based on the transfer of energy from one fiber to the other due to the change in their geometrical parameters. The interest in this coupler is due to its constructional simplicity because it can be constructed from the same fiber that is used in the optical line. This allows one to effectively match the coupler to the line circuit. Furthermore, the coupler allows one to obtain a wide range of coupling coefficients with a high directivity. They developed a theory for calculating the parameters of a coupler which allows one to determine its insertion loss, the optimum length of the junction and the corresponding coupling coefficients. (4 refs.)

106890 Reliability of arc-fusion spliced fiber with reinforcement element. M.Matsumoto, T.Haibara (Ibaraki Electrical Communication Lab., NTT, Ibaraki, Japan), M.Miyauchi.
Trans. Inst. Electron. & Commun. Eng. Jpn. Part B (Japan), vol.J66B, no.5, p.615-22 (May 1983). In Japanese.
Describes the breaking mechanism of optical fiber inside a reinforcement element at fiber splice joint. Several reliability tests were made for the reinforced elements, and it is clarified that stresses applied to the fiber inside the element due to fiber pushing out from the plastic coatings and fiber torsion are the main factors for fiber break at the splice. Splice portion reinforced by polyethylene shrinkable tube with a steel rod and EVA adhesive resin is found to be highly endurable for these stresses. Furthermore, the loss increase is only 0.02 dB/splice even at a very low temperature of −70°C. (8 refs.)

106891 Design of rubber sealing gas-tight dam for optical fiber cable. M.Sato, T.Senmaru (Ibaraki Electrical Communication Lab., NTT, Ibaraki, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part B (Japan), vol.J66B, no.5, p.671-8 (May 1983). In Japanese.
Describes a design method for a new type gas-tight dam for pressurized optical fiber cables. Soft rubber tube shrinking force and self-sealing effect are applied to obtain efficient gas-tightening for optical fibers. The gas-tightening mechanism, reliability of rubber parts and the influence on optical loss were investigated. As a result, a gas-tight dam design with excellent performance was achieved. (14 refs.)

106892 Applications of fibre-optic waveguides in the measuring art. S.Geckeler (Res. Labs., Siemens AG, Munchen, Germany).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.3-9 vol.2
The use of fibre-optic waveguides, in conventional measuring systems for noise-immune transmission of digital data at large bit rates is first dealt with. Methods available for measuring the properties of the fibre-optic waveguides (attenuation, bandwidth, etc.), are then dealt with. Sensors of both simple and sophisticated design for measuring various physical quantities (mechanical forces, temperature, electric current, rotation, etc.) using fibre-optic waveguides are discussed. (no refs.)

106893 Fiber cable design and characterization. M.R.Santana, B.R.Eichenbaum (Bell Telephone Labs., Norcross, GA, USA).
Electro/81 Conference Record, New York, USA, 7-9 April 1981 (El Segundo, CA, USA: Electron. Conventions 1981), p.8a/2/1-9
Optical-fiber cable design differs from the design of metallic cables principally because of two factors: i) the physical properties of fibers are more limiting than those of metals, and ii) the transmission performance of a fiber can be altered by cabling operations due to a phenomenon called microbending. After reviewing these factors, methods are considered for mitigating their effects by appropriate design procedures. This leads to the consideration of different types of cable structures. In order to evaluate an optical cable design, it is necessary that its important mechanical and optical properties, and impact performance, as well as cabling added loss, temperature dependence of loss, and concatenated fiber bandwidth are then considered. The authors conclude with a discussion of long term stability of optical cables. (22 refs.)

106894 Optical fiber connectors and splices. .Bowen (AMP Inc., Harrisburg, PA, USA).
Electro/81 Conference Record, New York, USA, 7-9 April 1981 (El Segundo, CA, USA: Electron. Conventions 1981), p.8a/3/1-4
A model is proposed for fiber alignment mechanisms. This model may be used to classify optical fiber connectors and splices. Primary, modified primary, secondary, and tertiary mechanisms are defined. These mechanisms relate to direct fiber-to-fiber junctions, and are based on the use of common overlay surfaces. The mechanisms differ in the number of material layers that are used between the fibers and the overlay surfaces. The advantages and disadvantages of each mechanism are explored. An analysis of the interface between fiber and alignment surfaces illustrates the effects of fiber diameter tolerance on fiber positioning accuracy. Connector and splice configurations are used to illustrate the various mechanisms. (no refs.)

106895 Fiber optic markets: history and forecast. F.W.Dixon (Gnostic Concepts Inc., Menlo Park, CA, USA).
Electro/81 Conference Record, New York, USA, 7-9 April 1981 (El Segundo, CA, USA: Electron. Conventions 1981), p.8c/2.1-7
In 1970, the US production of fiber optic components was less than $1 million, excluding R&D. This production grew to $4 million in 1975 and $50 million in 1980. The growing market for components during that decade was largely investment, principally by the government and the telecommunication industry to develop a technology needed, and by the major manufacturers of fiber and components. With the beginning of the new decade, the industry will turn the corner and for the first time begin to earn profits for component manufacturers. It is against this background that the author presents a history and forecast of the fiber optic market. Firstly, the situation in the US is explored and then the markets in Europe and Japan are considered. (no refs.)

106896 Fiber optic line sensors. D.H.Rowe (GTE Communications Products Corp., Mountain View, CA, USA).
Proceedings 1983 Conference on Crime Countermeasures and Security, Lexington, KY, USA, 11-13 May 1983 (Lexington, KY, USA: Univ. Kentucky 1983), p.9-12
The need for a security system sensor suitable for use in an extremely hostile EMI environment has initiated the development of a fiber optic line sensor suitable for direct burial applications. This is an active system which measures the change in polarization of the laser light output that occurs when an optical fiber undergoes microbending. This polarization change is detected by comparison of the outputs of two orthogonal polarizing filters located at the output end of the optical fiber. This paper describes the system performance and the fibers, sources, detectors, and electronic processor for use in a cost-effective sensor system. (5 refs.)

106897 Wide-beam atmospheric optical communication for aircraft application using semiconductor diodes. A.K.Majumdar, G.H.Fortescue (Kelly Johnson Res. & Dev. Center, Lockheed-California Co., Burbank, CA, USA).
Appl. Opt. (USA), vol.22, no.16, p.2495-504 (15 Aug. 1983).
Design considerations for atmospheric optical communication systems using wide divergent beams are described. This new approach can eliminate the need for complex gimbaled pointing and tracking mountings. Communicating systems have been designed and built using both infrared LED and CW and pulsed laser diodes operating in the wavelength range of $\lambda=0.8$-0.9 μm. Both single-channel and multichannel receivers were designed with fields of view (FOVs) ranging from 0.4 to 24°. Receiver performances were compared for a range close to 1 km under various ambient conditions. Laboratory simulation experiments were used to determine the operating margin and expected SNRs resulting from various design considerations. The need for narrow spectral bandwidth and wide-angle FOV interference filters is pointed out. The systems designed in the present work were low data rate (a few kbit/sec) communication systems and are suitable for aircraft-to-aircraft data exchange or voice communication. (22 refs.)

106898 Wavelength demultiplexing photodiode with very high isolation ration. S.Sakai, M.Umeno (Dept. of Engng. Sci., Nagoya Inst. of Technol., Nagoya, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.6, p.L338-9 (June 1983).
A new wavelength demultiplexing photodiode that utilizes a bragg reflector composed of a multi-thin crystal is proposed and its quantum efficiency and optical cross talk are calculated. It is shown that significant improvement in crosstalk can be obtained by the proposed structure without lowering the quantum efficiencies at the signal wavelengths. (6 refs.)

106899 Laser bias effect on the receiver sensitivity of passive fibre optic star bus networks. S.Moustakas, H.H.Witte (Res. Labs., Siemens AG, Munchen, Germany).
Opt. & Quantum Electron. (GB), vol.15, no.5, p.397-405 (Sept. 1983).
Examines the reduction in receiver sensitivity in passive fibre optic star bus networks due to the laser bias power transmitted by every terminal. Both transimpedance and high impedance preamplifier configurations using PIN and avalanche photodiodes are considered. The penalty in receiver sensitivity is examined as a function of bit rate, number of terminals, amplifier noise and the ratio of the launched laser bias power to average launched signal power. For PIN receivers the penalty has a maximum at low bit rates and falls off rapidly on either side of the maximum. In an example quoted the PIN receiver sensitivity penalty for networks with less than 50 terminals is less than 1 dB for all bit rates. The penalty for APD receivers increases with bit rate, and, in a further example, is shown to be less than 1 dB for networks with less than 50 terminals operating at bit rates lower than approximately 20 Mbit s^{-1}. Techniques for reducing the penalty to negligible levels are also examined. (10 refs.)

106900 Electrooptical Fresnel lens-scanner with an array of channel waveguides. K.Takizawa (Broadcasting Sci. Res. Labs., NHK Japan Broadcasting Corp., Tokyo, Japan).
Appl. Opt. (USA), vol.22, no.16, p.2468-73 (15 Aug. 1983).
A new type of beam scanner is discussed based on 1-D Fresnel zone plate consisting of titanium-diffused channel waveguides on $LiNbO_3$. By electrooptically controlling the guided-wave phase both beam scanning and 1-D focusing are achieved without a condensing lens. It was experimentally confirmed using the scanner with twenty-one Fresnel zones that the beam spot with a diameter of ~ 50 μm at half-power level of diffraction pattern is scanned over a distance of ± 70 μm in the focal plane with an applied voltage of ± 40 V at 633 nm. 42.85 OPTICAL TESTING AND WORKSHOP TECHNIQUES

106901 Aspheric lenses: an easier way. A.B.Nafarrate (Xerox Corp., Palo Alto Res. Center, Palo Alto, CA, USA).
Appl. Opt. (USA), vol.22, no.16, p.2400-1 (15 Aug. 1983).
Presents a near-index matching technique that can be used to make any kind of refractive optical surface that is not flat or spherical. The technique is very flexible and can be adapted to make a large variety of asphericS, from one-of-a-kind types such as a master for reference wave-front in null tests, to mass produced glass molded aspherics. Other optical components that can be made include achromats, anamorphic lenses, cylinders, axicons, off-axis, weak diffusers, Zernike, and Hilbert phase plates. A general aspheric shape in an immersion cell becomes an adjustable corrector plate by filling it with the proper fluid. It is also possible to limit this method to the correction of figure only by making the aspheric surfaces with the same quality finish that is needed in the case of exterior surfaces and assemble the pair in close proximity, leaving a uniform thin gap. An application for such aspheric will be in high power laser systems where a cooling gas may be circulated in the gap. (2 refs.)

106902 Precision molded-glass optics. R.O.Maschmeyer, C.A.Andrysick, T.W.Geyer, H.E.Meissner, C.J.Parker, L.M.Sanford (Res. & Dev. Labs., Corning Glass Works, Corning, NY, USA).
Appl. Opt. (USA), vol.22, no.16, p.2410-12 (15 Aug. 1983).
Results achieved in high-precision molding of glass lenses are reported. The work concentrated on a 0.4-N.A. 8-mm diam lens with spherical surfaces. The glass is a speciality glass composition of index (*d*-line) 1.604 and Abbe number 50. Typical design tolerances which have been achieved in the molded glass lenses include relative surface figure replication of 0.06 μm, thickness and diameter tolerances of ± 10 μm, wedge of $<10^{-3}$ rad, birefringence of less than one one-hundredth wave, and index homogeneity in the sixth decimal place. These results are directly applicable to molding precision glass aspheric lenses of similar tolerances. (11 refs.)

106903 Scatter ratio test for lens surface quality measurement. P.S.Schmitt, T.W.Webb, E.H.Barnett (Res. & Dev. Labs., Corning Glass Works, Corning, NY, USA).
Appl. Opt. (USA), vol.22, no.16, p.2416-18 (15 Aug. 1983).
The surface quality of an optical lens can be quantitatively measured using a scatter ratio test. A collimated light beam is focused by the test lens upon an opaque spot. A detector behind the spot measures light scattered past the spot. The spot is then displaced to the side so that total energy out of the lens is measured by the detector. The scatter ratio is the ratio of the two detector outputs. The test is shown to be reproducible and insensitive to operator effects. It is shown to be an effective process control tool for detecting changes in surface finish. The relationship between stylus measurements of lens surface roughness and the scatter ratios is shown. (13 refs.)

106904 *Q*-switched frequency-doubled Nd:YAG laser surface finishing of metals. C.W.Draper, A.Holliday (Western Electric Engng. Res. Center, Laser Studies Group, Princeton, NJ, USA).
Appl. Opt. (USA), vol.22, no.17, p.2521-2 (1983).
It is suggested that the concept of using laser radiation of one wavelength to treat an optical surface used in a high fluence laser environment at a different wavelength should be broadly considered. The authors illustrate that a *Q*-switched frequency-doubled Nd:YAG laser can be used to melt very shallow depths on metals frequently used in high power laser mirror applications. Rigorous damage threshold measurements have not been performed. However, it is demonstrated that some surface flaws common to conventional metal mirror preparation techniques can be locally repaired. (13 refs.)

106905 New light on fiber fabrication and materials.
Photonics Spectra (USA), vol.17, no.7, p.47-8, 50-1 (July 1983).
On every front, from technology to marketing, competition between the manufacturers of optical waveguides for communication is intensifying. Developments are concentrated in two major areas, the fabrication process itself and the materials that go into the glass perform. There are several fiber fabrication methods in the current use, but the most important for the communications field are variants of two: outside vapor-phase oxidation (OVPO) and inside vapor-phase oxidation (IVPO). These include Western Electric's proprietary version of IVPO, modified chemical vapor deposition, and the adaptation of OVPO developed at NTT laboratories in Japan and now in widespread use there, the method called vapor axial deposition (VAD). Over the years both process and fiber design improvements have reduced the attenuation marks of fibers based upon GeO_2 additions to fused silica, but researchers now feel that no further loss reductions can be expected with this glass sytem. Attention has turned to other glass systems, both oxides and nonoxides, and predictions have been made of much lower losses. To date, however, demonstrated losses are much higher than those for GeO_2-SiO_2 fibers. Chief contender seems to be fluoride glasses, especially those based on ZrF_4. (no refs.)

106906 Scaling up the neutral solution antireflection process. G.R.Wirtenson, N.J.Brown (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA), L.M.Cook.
Opt. Eng. (USA), vol.22, no.4, p.450-5 (July-Aug. 1983).
The neutral solution process (NSP) for chemically producing antireflection coatings has been scaled up from 24 cm and used successfully to treat components as large as 90 cm diameter. Since the process is primarily determined by diffusion through the surface, it has proven to be relatively insensitive to fluid flow effects which influence the chemical concentration buildup at the surface. Large parts visually appear more uniform than small parts processed in model tanks. The major problems encountered have been associated with using plastic support components beyond their normal temperature limits and with handling parts to the required cleanliness outside a clean room environment. (8 refs.)

106907 Method for subaperture testing interferogram reduction. W.W.Chow, G.N.Lawrence (Dept. of Phys. & Astron., Univ. of New Mexico, Albuquerque, NM, USA).
Opt. Lett. (USA), vol.8, no.9, p.468-70 (Sept. 1983).
Subaperture testing provides an attractive alternative to large monolithic test optics for evaluation of large optical systems. The authors present a method for reducing subaperture testing data that requires no a prior knowledge of the relative piston and tilt of the subapertures. Results of applying this method to analyze subaperture testing interferograms are presented. In particular, the behaviour of this method in the presence of data noise and for different subaperture configurations is studied. (4 refs.)

106908 Optical waveguide manufacturing techniques. M.G.Blankenship (Optical Waveguide Technol., Corning Glass Works, Corning, NY, USA).
Electro/81 Conference Record, New York, USA, 7-9 April 1981 (El Segundo, CA, USA: Electron. Conventions 1981), p.89/1/1-5
Optical fibers for communications links is a rapidly expanding technological field with many processes and materials being explored in R and D laboratories around the world. Nearly all the better performing fibers use high purity oxide glasses prepared from high purity metal halides, oxides or carbonates. The best optical performance has been obtained from vapor phase deposition of high silica glasses prepared from one of several approaches differing primarily by the geometry of deposition. The processes of outside vapor deposition, inside vapor deposition within a silica tube and axial vapor deposition followed by rod in tube processes are discussed by the author. The use of directly melted oxide glasses from a double crucible is also considered. Finally, fiber drawing and coating processes are briefly mentioned. (28 refs.)

106909 Optical fiber and cable manufacture. D.O.Jablonowski (Western Electric Co., Norcross, GA, USA).
Electro/81 Conference Record, New York, USA, 7-9 April 1981 (El Segundo, CA, USA: Electron. Conventions 1981), p.8a/4/1-7
The manufacturing techniques for optical fiber cable are fast being developed for large scale production. Basic steps of preform manufacture, draw, measurements, and cabling can be defined for the manufacturing processes. The preform is observed as an unimportant operation, since many fiber char-

acteristics are determined and production rates defined at that point. A free drawing operation using a high temperature furnace is employed for converting the preform into thin fiber; coating application is performed at the same time to ensure the retention of the intrinsic strength of the glass. Following characterization, fibers are cabled using either a stranded or a ribbon design. The cabling operations must be controlled to ensure that no stresses are placed on the fiber that would cause added loss. Improvements for efficient manufacture are evolving and refinements described by the author are expected to be made in order to reduce costs and increase volume. (20 refs.)

106910 Surface waves due to scattering by a near-surface parallel crack. J.D.Achenbach, Weichuan Lin, L.M.Keer (Dept. of Civil Engng., Northwestern Univ., Evanston, IL, USA).
IEEE Trans. Sonics & Ultrason. (USA), vol.SU-30, no.4, p.270-6 (July 1983).
Scattering of ultrasonic waves by a crack which is oriented parallel to a free surface is analyzed. Incident longitudinal and transverse body waves, as well as incident Rayleigh surface waves, are considered. The presence of a parallel subsurface crack gives rise to scattered surfaces waves whose amplitude-spectra show distinct resonance peaks, due to resonance of the layers between the crack and the free surface, particularly when this layer is thin. Scattering of body waves for normal incidence, both from the side of the free surface and from the interior of the solid, is investigated in some detail. The ratio of the amplitude spectra of the surface wave displacements for these two cases provides a measure of the distance d from the crack to the free surface. The length a of a crack can subsequently be obtained from a master curve which plots the first resonance frequency versus d/a. The amplitude spectra for scattered surface waves due to an incident surface wave also show resonance peaks, but these are part of a more complicated pattern of peaks and valleys, and they are therefore more difficult to classify. (13 refs.)

106911 Nonspecular effects for a finite incident beam modeled by an even-ordered polynomial. T.D.K.Ngoc, W.G.Mayer (Phys. Dept., Georgetown Univ., Washington, DC, USA).
IEEE Trans. Sonics & Ultrason. (USA), vol.SU-30, no.4, p.276-8 (July 1983).
The reflection of nonGaussian ultrasonic beams, expressed in terms of nth-ordered polynomials, is discussed and it is shown that at critical longitudinal and Rayleigh angles of incidence deviations from the Gaussian profile case occur, varying with the polynomial representation chosen. Examples are given for water-Plexiglas and water-stainless steel flat interfaces. (9 refs.)

106912 The field of a spherical wave reflected from a plane absorbent surface expressed in terms of an infinite series of Legendre polynomials. A.D.Rawlins (Dept. of Math., Brunel Univ., Uxbridge, England).
J. Sound & Vib. (GB), vol.89, no.3, p.359-63 (8 Aug. 1983).
The acoustic field of a spherical sound wave reflected from a locally reacting plane surface is expressed as an asymptotic expansion whose terms consist of the product of Legendre polynomials and powers of the reciprocal of the distance from the image source. (12 refs.)

106913 Note on a result of morse and Bolt [sound wave reflection]. A.D.Rawlins (Dept. of Math., Brunel Univ., Uxbridge, England).
J. Sound & Vib. (GB), vol.89, no.3, p.365-9 (8 Aug. 1983).
A result given without derivation by Morse and Bolt (Reviews of Modern Physics, vol.16, p.70, 1944) pertaining to the reflection of a spherical sound wave from an absorbent surface is investigated. It is shown that the result as given is not quite accurate. (3 refs.)

106914 On the radiation impedance of a rectangular piston. H.Levine (Dept. of Math., Stanford Univ., CA, USA).
J. Sound & Vib. (GB), vol.89, no.4, p.447-55 (22 Aug. 1983).
Single integral representations for the resistive and reactive components of the radiation impedance appropriate to a rectangular piston are established, thereby enabling a systematic refinement of estimate at both short and long wavelengths. Comparisons with previous analyses are made explicit as well as extensions and corrections thereto. (6 refs.)

106915 Nonstationary Doppler effect for waves propagating in nonhomogeneous media. V.I.Kyrlovich (Inst. of Appl. Phys., Acad. of Sci., Minsk, Belorussian SSR).
J. Eng. Phys. (USA), vol.43, no.4, p.1120-5 (Oct. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.4, p.609-15 (Oct. 1982). [received: Sept. 1983]

106916 Superposition principle in acoustics. V.I.Krylovich (Inst. of Appl. Phys., Acad. of Sci., Minsk, Belorussian SSR).
J. Eng. Phys. (USA), vol.43, no.5, p.1287-93 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.5, p.826-33 (Nov. 1982). [received: Sept. 1983]
Using the effect of the nonstationary frequency shift of acoustic waves in a medium with spatially and temporally varying properties, a theoretical estimate is made of the deviation from the superposition principle for an acoustic wave propagating in the field of another continuous plane wave. (9 refs.)

106917 On sound propagation above a locally reacting boundary. T.Kawai (Takenaka Tech. Res. Lab., Tokyo, Japan).
J. Acoust. Soc. Jpn. (Japan), vol.39, no.6, p.374-9 (June 1983). In Japanese.
An asymptotic solution of the scalar wave field due to a point source above a locally reacting plane surface is derived by the modified saddle-point technique and approximation of the surface wave term. The solution has a similar simple form to the Lawhead-Rudnick solution and the Ingard solution, and gives a perfectly uniform continuous field above the boundary. Numerical calculation indicates that the solution is more accurate than the Lawhead-Rudnick solution and the Ingard solution. (no refs.)

106919 Normal-mode sound field of directional radiator. Zhang Ren-he, Zhu Bai-xian (Inst. of Acoustics, Acad. Sinica, Peking, China).
Acta Phys. Sin. (China), vol.32, no.4, p.490-6 (April 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)* [received: Sept. 1983]
The sound field of a more general directional radiator in a stratified medium is treated, and the concept of directivity is applied to calculation of the normal modes. The result shows that the normal-mode field of a directional radiator can be obtained by supplementing the normal-mode expression of an omnidirectional point source with the directivity-excitation-function, which is dependent on the position and directivity of the radiator. In addition, the normal-mode fields of the radiators with vertical-symmetrical, vertical-antisymmetrical, single-side and sharp directivity are calculated. For the vertical line array in a homogeneous water-layer, if the source distribution is proportional to the eigenfunction of some normal mode, the zeros of the directivity-excitation-function are just corresponding to the directions of eigen-rays of other normal modes. (8 refs.)

106920 Accuracy of Doppler sonar measurements. D.A.Selivanovskii, I.A.Shereshevskii (Appl. Phys. Inst., Acad. of Sci., Ukrainian SSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.10, p.827-31 (Oct. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.10, p.1158-63 (Oct. 1982). [received: Sept. 1983]
The mathematical expectancy of the position of the center of gravity of the reverberation signal spectrum and the dispersion of this quantity are calculated for a single echo-sounding cycle with the assumption of statistical independence of the following random values: transducer translational velocity and its rate of change, direction of the transducer axis, and rotation during measurement. The scattering properties of the medium are presumed homogeneous over volume and it is assumed that sound is scattered noncoherently. Estimates of possible accuracies are obtained for various experimental conditions. (2 refs.)

106921 The responses of single degree of freedom systems with quadratic and cubic non-linearities to a subharmonic excitation. A.H.Nayfeh (Dept. of Engng. Sci. & Mech., Virginia Polytech. Inst., State Univ., Blacksburg, VA, USA).
J. Sound & Vib. (GB), vol.89, no.4, p.457-70 (22 Aug. 1983).
The response of single degreee of freedom systems with quadratic and cubic non-linearities to a subharmonic excitation is investigated. The method of multiple scales is used to derive two first order ordinary differential equations that govern the evolution of the amplitude and phase of the subharmonic. These equations are used to obtain the steady state solutions and their stability. The results indentify two critical values ζ_1 and ζ_2, where $\zeta_2>\zeta_1$, for the excitation amplitude f. The value ζ_2 is the threshold for the stability of the trivial solution. When $f>\zeta_2$, subharmonic oscillations of finite amplitude are always excited. When $f<\zeta_1$, subharmonic oscillations cannot be excited. But when $\zeta_1<f<\zeta_2$, subharmonic oscillations may or may not be excited, depending on the initial conditions. Also, the method of harmonic balance is applied to a special case of the problem considered. It is shown that, although the method seems straightforward, it can lead to erroneous results if extreme care is not taken in the ordering of the different terms. (16 refs.)

106922 Vibrations of polygonal plates due to thermal shock. S.Das (Dept. of Phys., Sonaulla H.S. School, Jalpaiguri, India).
J. Sound & Vib. (GB), vol.89, no.4, p.471-6 (22 Aug. 1983).
Vibrations of polygonal elastic plates due to thermal shock are investigated through use of complex variable theory. The numerical results are shown graphically for different polygonal plates and results for triangular, square and circular plates are compared with published results. (7 refs.)

106923 Sound radiation from rectangular plates vibrating in stripes mode. H.Yamane, Y.Ito, M.Kawamura (Coll. of Sci. & Technol., Nihon Univ., Tokyo, Japan).
J. Acoust. Soc. Jpn. (Japan), vol.39, no.6, p.380-7 (June 1983). In Japanese.
The angle dependence of radiated sound pressure and radiation ratio are investigated in the frequency range of $\lambda/\lambda_p<1$ for rectangular plates which vibrate in the stripes mode. They are calculated by introducing an angle component of the volume velocity at an elementary area on these plates whose angle component is determined by an angle between the rectangular plate and the plane containing the center axis parallel to the stripes and the observation point. The sound radiation from a surface of these plates is considered to be the radiation of sound from the bending waves in the plates which are propagated perpendicular to the stripes for the positive and negative directions. The radiation of sound from the bending wave in the one direction is approximated by the sound radiation from the rectangular piston which vibrates the maximum value of vibrational velocity of the bending waves, the dimensions of the rectangular piston are the same length of the parallel side to the stripes in width and $[1-(\lambda/\lambda_p)^2]^{1/2}$ times the original side of the plates in length. The radiation ratio of these plates is expressed as $[1-(\lambda/\lambda_p)^2]^{1/2}$. The experimental results are in good agreement with the calculated ones. (11 refs.)

43.50 NOISE, ITS EFFECTS AND CONTROL

(see also 86.70J Environmental science)

106924 The application of barriers, enclosures and area absorption to wire stranding operations [noise control]. J.F.Yerges (Yerges Consulting Engrs., Waunakee, WI, USA), J.G.Bollinger.
Noise Control Eng. J. (USA), vol.21, no.1, p.10-20 (July-Aug. 1983).
Wire rope mills are an extreme case of a common type of industrial noise problem. Large numbers of production machines are grouped in regular arrays across the plant floor, producing noise levels in excess of 100 dB(A). A study was undertaken dealing with the application of conventional, or traditional, noise control methods to wire stranding operations. These methods include area absorption, partial-height barriers, and partial and complete enclosures. The authors judged these methods in light of the working definition of 'feasibility' that has evolved during the process of federal regulation of workplace noise and subsequent legal review. By this definition, a feasible noise control method must produce a significant noise reduction without causing an unacceptable production penalty. Limits are set on the feasible cost per affected worker. Area absorption and partial height barriers appear to meet all of these tests of feasibility when applied in the rope mill. Retrofit partial and complete enclosures, however, appear to exceed the feasible cost limitations. (10 refs.)

106925 Noise characteristics of large wind turbine generators. H.H.Hubbard (Coll. of William & Mary, Newport News, VA, USA), F.W.Grosveld, K.P.Shepherd.
Noise Control Eng. J. (USA), vol.21, no.1, p.21-9 (July-Aug. 1983).
The authors summarize the noise characteristics of three representative large wind turbine generators. The main noise sources are identified along with state of the art noise prediction methods. Loading noise components are a characteristic of downwind machines and are usually confined to frequencies below 100 Hz. Broadband components extend throughout the audible frequency range and are observed for both upwind and downwind machines. (28 refs.)

106926 Evaluation of human exposure to the noise from large wind turbine generators. K.P.Shepherd (Bionetics Corp., Hampton, VA, USA), F.W.Grosveld, D.G.Stephens.
Noise Control Eng. J. (USA), vol.21, no.1, p.30-7 (July-Aug. 1983).
The authors have developed a procedure to evaluate human exposure to the noise from large wind turbine generators. The evaluation is based on the noise at the receiver location, which is measured directly or inferred from a knowledge of the noise at the turbine site along with an estimate of the atmospheric propagation effects. The evaluation involves a comparison of the noise and any noise induced building vibration with the human perception thresholds which have been developed for wind turbine noise. (13 refs.)

106927 Aspects regarding the behaviour of double circuit 400 kV OHEL three phase conductors from the point of view of corona discharges. D.Cristescu, M.Ungureanu, P.Postolache, G.Magureanu.
Energetica (Rumania), vol.31, no.5, p.235-8 (May 1983). In Rumanian.
The paper considers the radioelectric perturbatory level of double circuit 400 kV OHEL with three phase conductors and Donau-type crowns. The predetermination calculus as well as the experiments carried out at the High Voltage Techniques Laboratory of the Polytechnical Institute of Bucharest are presented. The experimental determination of the acoustic noise at these types of OHEL are presented as well as the noise standardization criteria. Connected to the radioelectric perturbatory level of conductors, the experimental determinations of the radioelectric perturbatory level of insulator chains is also shown, for three phase conductors which are to be used for the future 400 kV double circuit OHEL. (5 refs.)

106928 A halt to sound pollution!. E.Catier.
Electron. Ind. (France), no.55, p.59-67 (15 June 1983). In French.
Following a brief review of the sources of noise (N.B. acoustic not electronic!) in the modern world and its 'nuisance-value', its nature, as distinct from harmonic sounds is analysed, and the harmful effects of loud noise examined. The physiology of hearing and of deafness are examined, and the principles of noise measurement and surveying are summarized. (no refs.) *J.S.*

106929 Prony's method applied to estimate noise source locations and their sound powers. K.Inomoto, S.Hatori (Dept. of Electrical Engng., Mie Univ., Tsu City, Japan).
J. Sound & Vib. (GB), vol.89, no.4, p.509-17 (22 Aug. 1983).
An application of Prony's method for evaluating the acoustic power and location of sound sources from spatially sampled data is described. A sound source considered as a point source has an intensity proportional to the inverse square of the distance between source and observation point. The Fourier transform of this intensity function is an exponential function with a real exponent. The shift property of the Fourier transform results in a spectral change in the phase angle, which is expressed in the transform domain by a multiplicative exponential function of pure imaginary exponent. In this paper the usual time axis of the Fourier pair of time and frequency is treated as a variable denoting the location of the sound source. Accordingly, each spectral component of spatially sampled sound intensity generated by n point sources can be expressed as a linear combination of n complex exponentials. By applying Prony's method to the spectral data, these unknown exponents can be calculated numerically. This paper deals with an estimation procedure to find the location and power of a noise source. The estimation is done by minimizing the sum of the squares of the errors between the model and measured data. The proposed method has general applicability to problems where the so-called inverse square law for intensity can be assumed to be valid. (5 refs.)

106930 On the prediction of impact noise. VI. Distribution of acceleration noise with frequency of acceleration noise with frequency with application to bottle impacts. E.J.Richards, A.Lenzi, J.Cuschieri (Inst. of Sound & Vibration Res., Univ. of Southampton, Southampton, England).
J. Sound & Vib. (GB), vol.90, no.1, p.59-80 (8 Sept. 1983).
For pt. V see ibid., vol.88, p.333 (1983). The spectral distribution of the acceleration noise is obtained using both the pressure waveform expression and the spatial averaged velocity on the surface of the body, together with a radiation efficiency associated with the rigid body movement of the object. This distribution with frequency is shown to be mainly dependent on the size of the body and the duration of the transient and is independent of the body shape detail and the exact shape of the transient. The spectral distribution of acceleration noise is important in the case of impact of structures whose first ringing natural frequency is within the frequency range under investigation. Under such circumstances, it is important to estimate the response of the structure below this resonant frequency. This is investigated to show that the response, and hence the noise radiated from a structure below the first ringing frequency, is low and the noise in this frequency range is mostly due to acceleration noise. These results are verified in the case of bottle clashes. (8 refs.)

106931 Prediction of the noise propagation in a city area composed of randomly distributed buildings. S.Ieda, H.Ma, K.Kuno, K.Ikegaya (Dept. of Electrical Engng., Nagoya Univ., Nagoya, Japan).
J. Acoust. Soc. Jpn. (Japan), vol.39, no.4, p.239-46 (April 1983). In Japanese.
A new method of prediction for the noise propagation in a city area is proposed. In this method, buildings in a city area are assumed to be randomly distributed. Therefore, the characteristics of the noise propagation are easily given. By using the average height of the buildings and the perspective distance among them, the propagation losses are predicted without solving the wave-equation subject to the complex boundary conditions. In order to examine the results, the random distribution of the buildings is produced by the computer simulation, and the properties of the noise propagation are calculated. In addition, the scale model experiments are made on the distribution of the buildings. From the results of the computer simulation and the model experiments, the prediction method is proved to be appropriate. (14 refs.)

43.60 ACOUSTIC SIGNAL PROCESSING

106932 Developments in acousto-optic signal processing. D.Casasent (Carnegie-Mellon Univ., Pittsburgh, PA, USA).
Trends & Perspect. Signal Process. (USA), vol.3, no.2, p.1-6 (June 1983).
Discusses electronic warfare and radar; the Chirp z-transform spectrum analyzer; commercial wideband optical spectrum analyzers; types of optical signal processors; reliability of SAW devices in optical processing; integrated

acousto-optic SAW devices; fabrication of SAW dispersive delay lines; bulk acousto-optic devices; space-integrating AO systems; time-integrating AO systems; general-purpose OSP systems; matrix-vector; iterative processors, and systolic array optical processors. (no refs.)

106933 A new approach to high-speed digital signal processing based on microprogramming. K.Sekiguchi, K.Ishizaka, T.K.Matsudaira, N.Nakajima (Sony Corp., Tokyo, Japan).
J. Audio Eng. Soc. (USA), vol.31, no.7-8, p.517-22 (July-Aug. 1983).
A microprogrammed high-speed signal processor is presented. Bipolar bit-slice arithmetic logic units (ALU) combined with high-speed parallel multipliers permit the processing programs, such as digital filters and reverberation simulations requiring many additions and multiplications, to be executed rapidly and efficiently. Microinstructions and the microprogram development system, designed for this machine, are also described. (4 refs.)

106934 A restoration procedure for (non-stationary) signals from moving sources. H.P.Verhas.
J. Sound & Vib. (GB), vol.89, no.4, p.487-97 (22 Aug. 1983).
Moving sources, such as trains, cars and airplanes, provide non-stationary sound and vibration signals in situations where the receiver is not moving with the source. For non-stationary signals there are strong limitations on the use of computerized analysis techniques based on Fourier transformation. For instance, it is not possible to compute reliably either power spectral density functions of coherence functions. A procedure has been developed, and is discussed in this paper, that restores non-stationary signals into stationary ones, thus enabling one to apply the analysis techniques mentioned above to moving source data with a reliable outcome. (1 ref.)

106935 Acoustic surface wave band filters with weighted fan transducers. E.A.Nelin, I.M.Grankin, V.V.Kiselev, D.V.Karpeev, S.N.Kondrat'ev, V.V.Praporshchikov (Polytech. Inst., Kiev, Ukrainian SSR).
Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.242-3 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.390-2 (Feb. 1983). [received: Sept. 1983]
Acoustic surface wave (ASW) band filters are widely employed in diverse radioengineering systems and must satisfy increasingly stringent requirements. In the past, the performance of ASW filters has been improved by reducing the effects of second-order phenomena and fabrication errors. This approach is limited because of computational difficulties and attainable fabrication accuracy. Because of residual second-order effects, the side lobes are usually not attenuated by more than −50 dB, particularly when the amplitude-frequency (AF) characteristic is highly rectangular. The authors propose a novel approach based on shaping the frequency characteristic of an ASW filter. They examine shaping of the frequency characteristic of a filter consisting of two identical fan transducers. (5 refs.)

43.70 SPEECH COMMUNICATION

(inc. speech perception, speech intelligibility, and speech synthesis; see also 87.36 Speech)

106936 A connected spoken word or syllable recognition algorithm by pattern matching. S.Nakagawa (Faculty of Engng., Toyohashi Univ. of Technol., Toyohashi, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part D (Japan), vol.J66D, no.6, p.637-44 (June 1983). In Japanese.
A constant time delay dynamic programming (DP) matching algorithm and $O(n)$ DP-matching algorithm are proposed for connected spoken word recognition. The algorithms are based on the same principle of two level DP, level building DP and clockwise DP matching methods. The algorithms are computationally more efficient than the conventional methods. In particular, $O(n)$ DP matching algorithm requires only the DP-matching of n times for the connected word recognition in the vocabulary size of n words. This amount of computation is the same order of that of isolated word recognition. The author also proposes an algorithm of Japanese phonetic typewriter based on syllable to syllable matching by using these algorithms. (11 refs.)

106937 Coding allophones for speech synthesis. J.G.May (General Instrument Corp., Microelectronics Div., Hicksville, NY, USA).
Midcon/82 Conference Record, Dallas, TX, USA, 30 Nov.-2 Dec. 1982 (El Segundo, CA, USA: Electron. Conventions 1982), p.6/4/1-5
Starting from a discussion of how the different classes of speech sounds are produced in the vocal tract, the author proceeds to an explanation of the resulting acoustic characteristics of these articulations and their consequences for synthesis. She considers the segmentation problems which arise from coarticulation along with a description of the items in the General Instrument allophone set. (10 refs.)

43.75 MUSIC AND MUSICAL INSTRUMENTS

106938 Normal modes of the modern English church bell. R.Perrin, T.Charnley (Dept. of Phys., Loughborough Univ. of Technol., Loughborough, England), J.DePont.
J. Sound & Vib. (GB), vol.90, no.1, p.29-49 (8 Sept. 1983).
Experimental measurements of the frequencies and nodal patterns of all the partials of a good quality 214 kg English church bell up to about 9 kHz have been made. By matching these with the results of finite element calculations an understanding of the physical mechanisms generating the various partials has been achieved. This has made possible the production of a classification scheme for the partials with a firm physical basis, and has given considerable new insight into church bell design. In particular it is now clear just how crucial to the production of the bell's characteristic timbre is the thick ring near its rim. (9 refs.)

106939 Violin acoustics. C.M.Hutchins.
J. Acoust. Soc. Jpn. (Japan), vol.39, no.3, p.204-13 (March 1983). In Japanese.
Describes the development process of eight types of violins capable of providing well-balanced sound. Modern violins are provided with their respective strings tightened with a tensile force of approximately 27 kg weight. To provide the best-performance violin, its plate vibration modes should be measured to find the most suitable resonance frequencies and patterns. The Helmholtz air resonance should be at approximately 294 Hz. (74 refs.) *K.B.*

43.85 ACOUSTICAL MEASUREMENTS AND INSTRUMENTATION

(for acoustic noise measurement, see also 43.50; for photoacoustic spectroscopy, see 07.65)

106940 Acoustic parameters of commercial plastics. Bing-Nan Hung (Dept. of Biomedical Engng., Chung-Yuan Christian Univ., Chung Li, Taiwan), A.Goldstein.
IEEE Trans. Sonics & Ultrason. (USA), vol.SU-30, no.4, p.249-54 (July 1983).
Density, acoustic velocity, impedance, and attenuation measurements have been performed on representative samples of commercial plastics using a variation of the Papadakis technique (1973). A detailed description of the analysis of the measurement data and calculation of the estimated measurement uncertainties are presented. In some cases the measurement results are found to disagree with those of others. These differences are ascribed to real differences of these parameters due to material variations during manufacture. The results suggest that ultrasonic measurement techniques can be used by the plastics industry for quality assurance and material identification purposes. (17 refs.)

106941 Apparatus for measuring the velocity of acoustic waves in solids. A.I.Korobov, Yu.A.Brazhkin, S.G.Buga (State Univ., Moscow, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1490-2 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.158-60 (Nov.-Dec. 1982).
An apparatus is described for measuring small variations in the velocity of acoustic waves in solids with the application of external electric fields. The apparatus operates on a modulation measurement technique and can be used to measure directly the derivative of the acoustic wave velocity with respect to the electric field. the sensitivity to relative variations of the acoustic wave velocity is $(1\text{-}3)\times10^{-8}$. (4 refs.)

106942 A portable microprocessor-controlled instrument for measuring the moments of an amplitude histogram [acoustic measurement application]. I.G.Rees, C.G.Don (Dept. of Appl. Phys., Chisholm Inst. of Technol., Caulfield East, Victoria, Australia).
J. Phys. E (GB), vol.16, no.9, p.832-5 (Sept. 1983).
A microprocessor-controlled instrument has been constructed to permit field studies involving skewness and kurtosis. A 1024 channel amplitude histogram is formed within the memory by sampling an applied voltage at rates up to 10 kHz. The first four moments of the distribution are computed and, for acoustical studies, selected noise indices are also calculated. The advantage of a field portable instrument is demonstrated by comparing results taken directly from a tape recording of some common acoustic sounds. (5 refs.)

106943 An efficient algorithm for measuring the impulse response using pseudorandom noise. J.Borish, J.B.Angell (Dept. of Music, Stanford Univ., Stanford, CA, USA).
J. Audio Eng. Soc. (USA), vol.31, no.7-8, p.478-87 (July-Aug. 1983).
The impulse response of a linear system can be determined by exciting the system with white noise, and cross-correlating the input and output. As contrasted with the straightforward technique using an impulsive excitation, this approach is capable of providing vastly superior dynamic range. In order to minimize the amount of computation required by the cross-correlation step, the system can be excited by a binary maximal length sequence and the cross correlation performed using the fast Hadamard transform. By this means, only additions are required, and the number of additions is approximately $2.5n \log_2 n$, where n is the length of the sequence. (17 refs.)

106944 A selective two microphone acoustic intensity method. J.Bucheger (Cummins Engine Co., Columbus, IN, USA), W.Trethewey, H.A.Evensen.
J. Sound & Vib. (GB), vol.90, no.1, p.93-101 (8 Sept. 1983).
A multiple input, two output model is proposed which enables the two microphone acoustic intensity method to decompose the intensity vector into contributions from individual sources, even when they are coupled and in close proximity within the measurement surface. By treating characteristic signals from each source as the inputs, and the sound pressure signals from the two closely spaced microphones as the outputs, the model's frequency response functions are developed from a least squares approximation. The cross spectrum between the two microphones can then be expressed as a function of the input signal spectra and the model's frequency response functions. By manipulating the model terms the selective cross spectrum associated with the radiation from each individual source can then be estimated. The selective cross spectrum is then processed via standard methods to obtain the acoustic intensity vector from each source. A series of laboratory experiments is summarized which demonstrated that the technique can accurately decompose the acoustic intensity vector from highly coherent sources ($\gamma_{12}^2>0.9$) buried in background noise is a semireverberant environment, to within 1 dB of the directly measured intensities. (20 refs.)

106945 Methods of measurement and description of A-weighted sound pressure level. J.Igarashi (Kobayashi Inst. of Phys. Res., Kokubunji, Japan).
J. Acoust. Soc. Jpn. (Japan), vol.39, no.3, p.191-6 (March 1983). In Japanese.
An amendment of JIS Z 8731 Methods of Measurement and Description of A-weighted Sound Pressure Level was made according to ISO recommendations. Sound pressure is transformed into voltage by a microphone, an A-weighted weighting network shapes the voltage to account for the frequency response of the ear, and the weighted voltage is integrated over a specified time period. For practical purposes the equivalent continuous A-weighted sound pressure level L_{AeqT} is determined by the equation $L_{\mathrm{AeqT}}=10 \log [(1/N)\ 10^{L_i(t)/10}]$ where N is the number of samples during the time $T=(N\text{-}1)\Delta t$, and L_i is the i-th instantaneous A-corrected noise level in the time intervals Δt. (1 ref.) *K.B.*

106946 On the revision of JIS C 1512 'Level recorders for recording sound level and/or vibration level'. H.Miura (Electrotech. Lab., Ibaraki, Japan).
J. Acoust. Soc. Jpn. (Japan), vol.39, no.3, p.197 (March 1983). In Japanese.
JIs C 1512, 'Level recorders for recording sound level and/or vibration level', was partially amended. The RMS detector circuits were specified both for sound level recorders and for vibration level meters. The RMS value of the signal from the sound or vibration level meter shall be applied to the level recorder. (1 ref.) *K.B.*

106947 Noise loudness level calculation. Yu.A.Indlin.
Tekh. Kino & Telev. (USSR), no.6, p.20-3 (June 1983). In Russian.
A procedure for calculating noise loudness level is proposed, based on these measured parameters: the sound pressure level and spectrum width. For complex noise the latter is measured from data of the third-octave spectrum at 24 dB below the noise level. The procedure gives more exact approximation to

the subjectively assessed loudness levels as compared to the calculations according to Zwicker (1958) and Stevens (1961). (13 refs.)

106948 Trends in improving sound signal level meters. B.V.Nekrasov, A.V.Nikonov, T.M.Fedorova.
Tekh. Kino & Telev. (USSR), no.6, p.37-43 (June 1983). In Russian.
Considers trends in sound signal level meter designing. The results of subjective-statistical tests are given, based on the criterion of preferential use of various indicating instruments using pointers, gas-discharge devices, LED, and mirrors. Analog-digital and digital level meters are discussed. (24 refs.)

106949 Sounding-rocket flight test of an acoustic mixer by manufacture of a lead zinc emulsion alloy in microgravity. P.F.Clancy (ESA/ESTEC, Noordwijk, Netherlands), W.Heide, D.Langbein.
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.99-104
An acoustic mixer system capable of mixing immiscible alloys, powder/metal and fibre/metal melts in microgravity has been developed and successfully test flown on the TEXUS 5 rocket flight with a lead-zinc immiscible alloy system. The results obtained have shown that the mixer has performed as planned giving thorough mixing of the melt both before and during the microgravity cooling phase. The particle size distributions obtained in microgravity are different to those obtained in 1-g. A further experiment to elaborate this effect is planned for the TEXUS 7/8 campaign in 1983. 106950 Analysis of the high-field losses of polyvinylidene fluoride transducers. Wen-Hsien Chen (Dept. of Phys., Chung Cheng Inst. of Sci. & Technol., Tashi, Taoyuan, Taiwan).
IEEE Trans. Sonics & Ultrason. (USA), vol.SU-30, no.4, p.238-49 (July 1983).
A general theory, based on the impedance matrix model, for predicting the performance of an acoustic transducer made from a piezoelectric material with nonnegligible dielectric loss and mechanical loss has been formulated and expressed in terms of an equivalent electric series circuit. Computer programs were designed to predict the electrical input impedance as a function of frequency of PVF_2 transducer, and to model the radiated acoustic power as a function of input electric field, and the temperature rise and the efficiency of the PVF_2 film under high electric field, as high as 30 V/μm operation. The dielectric loss, and dielectric permittivity in oriented PVF_2 film were measured from 0.5 MHz to 100 MHz. The measured loss tangent and permittivity as functions of frequency were used to model the dielectric and acoustic losses in the theoretical calculation. Measurements on the electrical input impedance of loaded PVF_2 piezofilms show good agreement to that of theoretical calculations. (10 refs.)

106951 Optoacoustic transducers with intensity-modulated inputs. B.Noorbehesht, V.Arat (Electrical Engng. Dept., Univ. of Houston, Houston, TX, USA).
IEEE Trans. Sonics & Ultrason. (USA), vol.SU-30, no.4, p.255-64 (July 1983).
The use of intensity-modulated optical input has been suggested to improve the acoustic switching ratio in optoacoustic transducer (OAT) transmitters and receivers. The results of a comprehensive theoretical and experimental study of a prototype OAT operated in the transmitter mode and illuminated by intensity-modulated light are presented. The device under these conditions can be regarded as a linear temporal system with one time-varying element. It is shown, using an electrical equivalent circuit, that when sinusoidally intensity-modulated light is used to activate selected regions of the OAT, additional signals are generated in the illuminated regions which do not exist in the dark regions. These signals are at different frequencies than those in the dark regions. Therefore, in principle, infinite switching ratio may be realized at these frequencies. The effectiveness of this scheme depends on such characteristics as response time and degree of photoconductivity of the photoconductor, frequency of the electrical signal, and modulation frequency of the optical input. Experimental results from a prototype OAT demonstrate the feasibility of intensity-modulation techniques. Switching ratios as high as 50 dB have been obtained in the laboratory. Experiments have verified some of the predictions of the theoretical model. (11 refs.)

106952 An extended model of the ultrasonic transducer. M.G.Silk (Materials Phys. Div., Nondestructive Testing Centre, AERE, Harwell, England).
J. Phys. E (GB), vol.16, no.9, p.879-87 (Sept. 1983).
The linear model of the ultrasonic transducer has been extended to allow for the effects of diffraction, poor bonding and the various shapes of calibration reflectors. In this way the predictions of the model are brought closer into line with the practical results which would be obtained when transducers are calibrated. All of the common calibration targets are included in the model while, within the limitations outlined, the response of transducers to some natural defects could also be predicted. (10 refs.)

106953 Satisfying louspeaker crossover constraints with conventional networks—old and new designs. R.M.Bullock,III (Dept. of Math. & Statistics, Miami Univ., Oxford, OH, USA).
J. Audio Eng. Soc. (USA), vol.31, no.7-8, p.489-99 (July-Aug. 1983).
Conventional crossovers are realized using passive all-pole filters. Consequently the constraints which can be imposed on their behavior are severely limited. In loudspeaker applications constant power, constant voltage amplitude, and linear phase are highly desirable. It is argued that while linear phase cannot be achieved, some phase control is possible, and the constraints of constant power and constant voltage amplitude can be satisfied. However, tradeoffs must be made since conventional crossover satisfies all three properties. It is shown that constant power and amplitude require the Butterworth and all-pass crossovers. If phase control is paramount, a new crossover is introduced which allows a selectable variation in power and amplitude, while maintaining a fixed phase behavior. (5 refs.)

106954 Delta stereophony—a sound system with true direction and distance perception for large multipurpose halls. G.Steinke (Rundfunk- und Fernsehtech. Zentralamt der Deutschen Post, Berlin, Germany).
J. Audio Eng. Soc. (USA), vol.31, no.7-8, p.500-11 (July-Aug. 1983).
The Delta stereophony system designed for the Palace of the Republic in Berlin, GDR, is described. The system provides coincidence of optical and acoustical directional impressions and overcomes the shortcomings of some other methods. It consists of a multichannel arrangement of microphones or other sound-signal sources, a multichannel mixing console, a special delay unit, and a multichannel arrangement of several loudspeaker groups. These groups are arranged above and beneath the stage edge so that they radiate in the direction nearly normal to the stage edge and into the auditorium. The distribution and the exact arrangement of the loudspeaker groups are intended to obtain uniform and satisfactory sound coverage of the auditorium as well as a differentiation of the directional projection from different sound sources. For technical-economic reasons, the number of channels will seldom exceed six to eight. With small halls, the number will be smaller. (7 refs.)

106955 PRIZ-1 set of ultrasonic measurement transducers. A.F.Mel'kanovich, G.V.Pyabus (All-Union Sci.-Res. Inst. for Dev. of Nondestructive Methods & Means of Materials Quality Control, Kishinev, USSR).
Sov. J. Nondestr. Test. (USA), vol.18, no.10, p.837-9 (Oct. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.10, p.94-6 (Oct. 1982). [received: Sept. 1983]
The PRIZ-1 set of wideband transducers is designed for measuring and monitoring the spectral and temporal characteristics of acoustic pulses radiated by ultrasonic instruments in the frequency range 0.2-30 MHz. To enhance the quality of nondestructive testing facilities and impart reliability to the interpretation of results, it is important to generate, in the testpiece, acoustic pulses that meet definite requirements. The pressure transfer ratio, the modulus of the electrical impedance at the lower limit of the working frequency range and the diameter of the active element are given for each transducer. The amplitude-frequency responses of the ultrasonic transducers are displayed. (5 refs.)

43.90 OTHER TOPICS IN ACOUSTICS

106956 Experiments on the degenerate parametric source in air. S.Aoki, Y.Nakashima, T.Kamakura, K.Ikegaya (Dept. of Electrical Engng., Nagoya Univ., Nagoya, Japan).
J. Acoust. Soc. Jpn. (Japan), vol.39, no.4, p.247-52 (April 1983). In Japanese.
Describes the experimental results of degenerate parametric amplification which are performed in free field. The amplitude and phase controlled sound source consists of twelve tweeters, which radiates a 10 kHz powerful pump wave and a 5 kHz weak signal wave synchronously and collinearly. SPLs of both waves are 142 dB and 122 dB *re* 20 μPa at 1 m, respectively. The pump level is not so high as shock is formed. The obtained data confirm that the amplification really exists and the parametric signal periodically varies in amplitude with the initial phase of the weak signal having a period of π. These results are in identical fashion with the plane progressive wave in a tube except fo $\pi/4$ phase difference. Changes in beam pattern with the phase are also observed. The authors discuss the far-field behavior of the parametric signal by using the modified Pestorius' algorithm (1973). (9 refs.)

106957 Development of an acoustic levitation device with a mirror furnace. Y.Ikegami (Res. Inst., IHI, Tokyo, Japan), E.Mori, M.Saito.
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.121-5
A mirror furnace with a heating tube is effective for the heating of a small sample which is acoustically levitated in the tube. The authors describe experiments on the acoustic levitation in a transparent quartz tube with a mirror furnace. Several experiments were conducted in a terrestrial environment, and the authors found that a sample of (glass balloon, max. 500 mg) was levitated at stable conditions up to a temperature of about 600°C, and that a sample was continuously levitated during the increase and decrease of temperature by about 150°C, or pressure change of 250 Pa. by controlling the reflector position and gas components, using a microcomputer. (3 refs.)

44.00 HEAT FLOW, THERMAL AND THERMODYNAMIC PROCESSES

44.10 HEAT CONDUCTION (MODELS, PHENOMENOLOGICAL DESCRIPTION)

106958 On the heat conduction of two associated bodies with moving boundary. V.A.Barvinok, V.I.Bogdanovich.
Power Eng. (J. Acad. Sci. USSR) (USA), vol.20, no.2, p.160-6 (1982). Translation of: *Izv. Akad. Nauk SSSR Energ. & Transp.,* vol.20, no.2, p.173-9 (1982).
A solution is obtained for the nonlinear problem of heat conduction in a system of two associated bodies with uniformly moving boundary; a perturbation-theory method is employed. The substitution of a linear system of equations for a non-linear system is evaluated with respect to the calculation of temperature fields in certain specific materials. (8 refs.)

106959 Nonstationary problem of heat conduction with arbitrary moving boundary. V.A.Barvinok, V.I.Bogdanovich.
Power Eng. (J. Acad. Sci. USSR) (USA), vol.20, no.6, p.101-8 (1982). Translation of: *Izv. Akad. Nauk SSSR Energ. & Transp.,* vol.20, no.6, p.128-35 (1982).
A small parameter is introduced in order to obtain a solution to the nonstationary problem of heat conduction for a system of two bodies with boundary moving in accordance with an arbitrary law for boundary conditions of the first, second, and third kinds. The given solution is used to determine the distribution of temperatures and the law governing the motion of the condensation boundary in production of coatings by the ion-plasma method. The reports given make it possible to obtain fairly complete information about the features of the thermal regime and the influence of the principal parameters on the rate of growth of the coating. (12 refs.)

106960 On one approach to finding an approximate solution of axisymmetric problem of unsteady heat conduction. M.M.Sidlyar, A.I.Lobanov.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.8, p.38-41 (1983). In Ukrainian.
The method of reducing a boundary value problems to ordinary differential equations is extended to an unsteady heat conduction problem. The first and second approximations for a finite length cylinder are considered as an example. (5 refs.)

106961 Steady heat conduction from an infinite row of holes in a half-space or a uniform slab. D.A.Caulk (Engng. Mech. Dept., General Motors Res. Labs., Warren, MI, USA).
Int. J. Heat & Mass Transfer (GB), vol.26, no.10, p.1509-13 (Oct. 1983).
A special boundary integral equation is used to analyze steady heat conduction from an infinite row of circular holes located below the surface of a half-space or along the midplane of a uniform slab. Numerical results show that standard handbook approximations for the total heat flux from any one hole can give sizable errors in both problems, even for modest values of the problem parameters. An alternative approximation proposed recently for the half-space problem is shown to offer a substantial improvement in accuracy. (6 refs.)

106962 Optimisation of homogeneous thermal insulation layers. J.P.Curtis (British Aerospace Dynamics Group, Bristol, England).
Int. J. Solids & Struct. (GB), vol.19, no.9, p.813-23 (1983).
The rate of heat loss from a body surrounded by a layer of homogeneous insulation is minimised by use of the Calculus of Variations. This optimisation is with respect to variation of the outer surface of the insulation layer, subject to the isoperimetric constraint that its volume remains fixed. Both Dirichlet and mixed boundary conditions for the temperature field on the outer surface are considered. Regular perturbation solutions in the case of small layer thickness are presented. (4 refs.)

106963 Question of constructing Tikhonov regularizing algorithms for non-one-dimensional inverse problems of heat conduction. V.B.Glasko, E.E.Kondorskaya (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
J. Eng. Phys. (USA), vol.43, no.4, p.1139-44 (Oct. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR),* vol.43, no.4, p.631-7 (Oct. 1982). [received: Sept. 1983]
Tikhonov regularizing algorithms are formulated and given a foundation for the multidimensional problem of determining the density of a finite heat source. Uniqueness of the solution is studied for one of the formulations of the problem. (13 refs.)

106964 Solution of the inverse coefficient problem of heat conduction. A.A.Goryachev, V.M.Yudin.
J. Eng. Phys. (USA), vol.43, no.4, p.1148-54 (Oct. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR),* vol.43, no.4, p.641-8 (Oct. 1982). [received: Sept. 1983]
An effective algorithm is developed for solving the inverse coefficient problem of heat conduction. Methods are proposed for improving the nonuniform convergence of the solution at the domain boundaries. (11 refs.)

106965 Computers in analysis and design [of heat transfer]. R.H.Pletcher (Dept. of Mech. Engng., Iowa State Univ., Ames, IA, USA), S.V.Patankar.
Mech. Eng. (USA), vol.105, no.6, p.73-9 (June 1983).
In the computational approach, a mathematical description of the transfer phenomenon is retained, and the governing equations—usually in partial differential forms—are solved numerically. This process may be viewed as a 'computer simulation' of the physical processes. (8 refs.)

44.30 HEAT TRANSFER IN INHOMOGENEOUS MEDIA AND THROUGH INTERFACES

106966 A finite-element front-tracking enthalpy method for Stefan problems. Chin Hsien Li (Oxford Univ. Computing Lab., Oxford, England).
IMA J. Numer. Anal. (GB), vol.3, no.1, p.87-107 (Jan. 1983).
A finite-element front-tracking method, which avoids explicit treatment of the jump condition on the phase boundary, is proposed. This method is based on the discretization of a weak enthalpy formulation with isoparametric space-time finite elements. A one-dimensional two-phase problem and a two-dimensional one-phase problem are solved by this method. Then the method is applied to a generalized Stefan problem—the spot-welding problem and extended to the alloy-solidification problem. Numerical experiments show that this method is convergent and unconditionally stable and that second-order convergence can be expected if the biquadratic elements are used for one-dimensional problems. The effectiveness of this method is, in particular, shown in solving the last two problems. (18 refs.)

106967 Effects of stepwise variation of albedo on reflectivity and transmissivity of an isotropically scattering slab. T.B.Clements, M.N.Ozisik (Dept. of Mech. & Aerospace Engng., North Carolina State Univ., Raleigh, NC, USA).
Int. J. Heat & Mass Transfer (GB), vol.26, no.10, p.1419-26 (Oct. 1983).
The reflectivity and transmissivity of an isotropically scattering plane-parallel slab with stepwise variation of the single scattering albedo within the medium are determined for an isotropically incident radiation. Tabulated results, covering a wide range of albedos, are presented. (8 refs.)

106968 Heat transfer characteristics of in-ground heat exchangers. O.J.Svec, L.E.Goodrich, J.H.L.Palmer (Nat. Res. Council of Canada, Ottawa, Ontario, Canada).
Int. J. Energy Res. (GB), vol.7, no.3, p.265-78 (July-Sept. 1983).
Most in-ground heat storage installations use a system of horizontal or vertical plastic pipes to carry heat exchanger fluid. In designing these systems it is generally assumed that the thermal effects of the plastic pipe can be neglected. This paper reports a laboratory study of the pattern of heat flow around fluid-carrying plastic pipe buried in clay soil. Heat flow measurements as well as estimated contact resistances are presented for a number of configurations. In addition, numerical model computations are given for steady-state, transient and cyclic behaviour of several configurations, and it is shown that substantially reduced heat flows are obtained when plastic pipe is used. (18 refs.)

106969 Effect of parameters of metal fiber capillary structures on maximum heat transport by heat pipes. M.G.Semena, A.N.Gershuni (Kiev Polytech. Inst., Kiev, Ukrainian SSR).
J. Eng. Phys. (USA), vol.43, no.4, p.1116-20 (Oct. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR),* vol.43, no.4, p.604-9 (Oct. 1982). [received: Sept. 1983]
The effect of the parameters of metal fiber capillary structures on the maximum heat transported by heat pipes is analyzed. (3 refs.)

106970 Mathematical model of the electrocontact heating of a steel bar in the region of current-conducting electrodes. V.K.Kapustkin (All-Union Sci.-Res. Inst. of Metall. Thermoengng., Sverdlovsk, USSR).
J. Eng. Phys. (USA), vol.43, no.4, p.1160-3 (Oct. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR),* vol.43, no.4, p.656-60 (Oct. 1982). [received: Sept. 1983]
A mathematical model of the electrocontact heating of a steel bar is developed, allowing the temperature fields in any cross section to be calculated. The adequacy of the model is verified by comparison with experiment. (8 refs.)

106971 Measurement of the thermophysical characteristics by the method of the regular cooling regime for a limited cylinder with a shell. M.Marich, B.Bachlich.
J. Eng. Phys. (USA), vol.43, no.5, p.1280-3 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR),* vol.43, no.5, p.817-22 (Nov. 1982). [received: Sept. 1983]
An analytic expression is used for the nonstationary temperature field of a limited circular cylinder with a shell to measure the thermal diffusivity by the method of the regular regime. The influence of a shell is taken into account by the first roots of the characteristic equations for an infinite sandwich plate and an infinite cylinder with a shell. (3 refs.)

106972 Real-time control of the free boundary in a two-phase Stefan problem. K.-H.Hoffmann, J.Sprekels (Naturwissenschaftliche Fakultat, Univ. Augsburg, Augsburg, Germany).
Numer. Funct. Anal. & Optimiz. (USA), vol.5, no.1, p.47-76 (1982).
A two-phase Stefan-problem is considered where the progress of the free boundary is observed by fully automatic real-time controls (thermostats or photoelectric cells). The heat flux at both fixed boundaries can be determined by heaters which respond to the signals of the controls, possibly with a certain time lag. The corresponding mathematical model leads to a two-phase Stefan problem with nonlinear and discontinuous boundary conditions with delays at the fixed boundaries. The problem is transformed into a set-valued fixed point equation, and the existence of a solution is shown with the aid of a theorem due to Bohnenblust-Karlin. The consequence of this result is that a free boundary with the well-known smoothness properties develops under the impact of a fully automatic real-time control via thermostats or photo-electric cells. Some numerical experiments are given. They indicate that the model is realistic. (11 refs.)

106973 The cooling of a low-heat-resistance stretching sheet moving through a fluid: a rejoinder. N.Afzal (Aligarh Muslim Univ., Aligarh, India).
Waerme- & Stoffuebertrag. (Germany), vol.17, no.4, p.217-19 (1983).
Deals with the comments of Kuiken (ibid., vol.16, p.101, 1982) disputing the accuracy of the solutions of an earlier work on the cooling of a low heat resistance stretching sheet moving through a fluid. It is shown that there is no loss of accuracy in the higher order perturbations, as claimed by Kuiken. Further, a comparison of the results of Euler transformation with those of Kuiken (based on direct and inverse series) show the agreement to four places of decimal for all values of steamwise distances. The results for heat transfer not considered in earlier papers are also presented. (4 refs.)

44.40 RADIATIVE HEAT TRANSFER

106974 Cold stress at high altitudes. N.C.Majumdar (Defence Inst. of Physiology & Allied Sci., Delhi Cantt, India), P.C.Gupta.
Def. Sci. J. (India), vol.33, no.2, p.147-58 (April 1983). [received: Aug. 1983]
The problem of cold at high altitudes has been analysed from a purely physical standpoint. It has been shown that Siple's Wind-Chill Index is not reliable because (i) it does not make use of the well established principles governing the physical processes of heat transfer by convection and radiation and (ii) it assumes that the mean radiant temperature of the surroundings is the same as the ambient dry bulb temperature. A Cold Stress Index has been proposed which is likely to be a more reliable guide for assessing the climatic hazards of high altitude environments. The Index can be quickly estimated with the help of two nomograms devised for the purpose. (13 refs.)

106975 Evaluation of spectrally-integrated radiative fluxes of molecular gases in multi-dimensional media. M.F.Modest (Dept. of Mech. Engng., Univ. of Southern California, Los Angeles, CA, USA).
Int. J. Heat & Mass Transfer (GB), vol.26, no.10, p.1533-46 (Oct. 1983).
A new multidimensional model has been developed which makes it possible to calculate the spectrally-integrated total radiative flux for a molecular-gas band based on the solution of two simple differential equations. The new model employs the exponential-wide-band model and makes it unnecessary to evaluate the spectral flux for a large number of wavenumbers with subsequent spectral integrations, thus considerably reducing the numerical effort required. Comparison with spectrally-integrated results from the differential (*P*-1) approximation, on which the present method is based, and with some exact results, shows excellent agreement for all situations. (16 refs.)

106976 Radiative heat transfer through opacified fibers and powders. K.Y.Wang, C.L.Tien (Dept. of Mech. Engng., Univ. of California, Berkeley, CA, USA).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.30, no.3, p.213-23 (Sept. 1983).
Radiative heat transfer through opacified (metallic or matallized) cylindrical fibers and spherical powders is investigated theoretically. The radiative properties of these packed particles are evaluated by using the solutions of electromagnetic theory. The large optical constants and large particle size parameters required an improved numerical scheme for evaluation of these properties. The results show that fine metal fibers provide excellent thermal radiation resistance. For the packed spheres, the high solid volume fraction restricts the present model to the geometric scattering regime. The results in this regime indicate better radiation resistance for smaller spheres. It is also interesting to note that, relative to unopacified spheres, the opacified spheres have higher thermal radiation resistance only at high temperatures. (16 refs.)

106977 The generalized exponential-integral $V(x,y)=\int 1\infty \exp(-xt)\ln(t+y)dt/t$ and computer algorithms for $y=0,1$. D.G.Hummer (NBS, Univ. of Colorado, Boulder, CO, USA).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.30, no.3, p.281-7 (Sept. 1983).
The generalized function exponential-integral function $V(x, y)$ defined here includes as special cases the function $E_1^{(2)}(x)=V(x, 0)$ introduced by van de Hulst (1980) and the functions $M_0(x)=V(x, 1)$ and $N_0(x)=V(x, -1)$ introduced by Kourganoff (1952) in connection with integrals of the form $\int E_n(t)E_m(t\pm x)$, which play an important role in the theory of monochromatic radiative transfer. Series and asymptotic expressions are derived and, for the most important special cases, $y=0$ and $y=1$, Chebyshev expansions and rational approximation are obtained that permit the function to be evaluated to at least 10 sf on $0<x<\infty$ using 16 sf arithmetic. (9 refs.)

106978 Radiative transfer in size-limited bodies. G.Brussaard (European Space Res. & Technol. Centre, Noordwijk, Netherlands).
Wave Propagation and Remote Sensing. Proceedings of URSI Commission F Symposium, Louvain-la-Neuve, Belgium, 9-15 June 1983 (Paris, France: ESA 1983), p.371-7
The paper studies radiative transfer through raincells of limited extent, in order to estimate the limitations of radiometric measurements of rain attenuation on slant paths. Results are given for model cells of cylindrical shape. It is shown that the errors caused by scattering are much larger in the case of a raincell occurring on the path and away from the radiometer site than in the classical case of a stratified rain medium of infinite horizontal extent. The accuracy obtainable for radiometric measurements in the 20 and 30 GHz band is shown to be severely limited by scatter effects. The effective medium temperature to be used in the classical radiometer equation will be a function of spatial characteristics of the rain medium. (7 refs.)

Measurements are made of the temperature dependences of the mean times before the boiling, at atmospheric pressure, of superheated n-pentane and n-hexane in a glass capillary tube, and with the introduction of a metal wire into the tube. (13 refs.)

106980 Temperature profiles induced by strip heaters. M.L.Burgemer, R.E.Reedy (Naval Ocean Systems Center, San Diego, CA, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.613-18
Presents a model based on analytic solutions to the heat equation that calculates the temperature profiles induced by line shaped heat sources. The sensitivity of isotherms to various heating conditions including the effect of tailoring power profiles in both curved and straight sources is discussed. Conditions are presented that result in 'dogbonded' shaped isotherms. Also shown is the effect that inhomogeneities (e.g., power density fluctuations or defects in the material) have on the ideal temperature profiles. (5 refs.)

106981 Solution of Stefan problem for melting bodies. A.A.Shmukin.
Power Eng. (J. Acad. Sci. USSR) (USA), vol.20, no.2, p.154-9 (1982). Translation of: *Izv. Akad. Nauk SSSR Energ. & Transp.*, vol.20, no.2, p.167-72 (1982).
A solution of the symmetric Stefan problem for melting bodies of simple form (plate, cylinder, sphere) is obtained in closed form (the heating and melting regimes are covered) and reduced to a standard procedure, integration of a system of ordinary differential equations. (9 refs.)

106982 Analysis of temperature fields of bodies in the shape of shells. N.M.Belyaev, V.I.Zavelion, A.A.Ryadno (Dnepropetrovsk State Univ., Dnepropetrovsk, USSR).
J. Eng. Phys. (USA), vol.43, no.4, p.1144-8 (Oct. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.4, p.637-41 (Oct. 1982). [received: Sept. 1983]
The temperature fields in axisymmetric thick-walled shells with different middle surface shape are investigated. (4 refs.)

106983 Numerical calculation of the temperature field of a one-step magnetofluid sealing unit. T.M.Krivonosova, A.K.Sinitsyn, V.E.Fertman (A.V. Lykov Inst. of Heat & Mass Transfer, Acad. of Sci., Minsk, Belorussian SSR).
J. Eng. Phys. (USA), vol.43, no.4, p.1164-7 (Oct. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.4, p.660-4 (Oct. 1982). [received: Sept. 1983]
The temperature distribution in a cooled magnetofluid sealing unit is investigated numerically. The dependence of the maximum temperature in the sealing layer of magnetic fluid on the rate of axle rotation is obtained for various conditions of cooling. (5 refs.)

106984 Mathematical modeling of the heating of long steel cylindrical parts under tempering in an inductor with a transverse magnetic field. V.B.Glasko, M.K.Trubetskov (Dept. of Math., Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.5, p.17-22 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.5, p.17-22 (1982).
On the basis of Tikhonov regularization theory, the problem of the heating of cylindrical samples under tempering in an inductor with a transverse magnetic field is considered. The a priori requirements on the resulting characteristics of the heating process are determined by the time dependence of the current strength needed for their determination. (7 refs.)

106985 Analysis of vibration by component mode synthesis method. III. Application to cylinder block of 4 cylinders. M.Ookuma (Tokyo Inst. of Technol., Tokyo, Japan), A.Nagamatsu.
Bull. JSME (Japan), vol.26, no.215, p.812-17 (May 1983).
For pt.II see ibid., vol.25, p.1093 (1982). A cylinder block of 4 cylinders is analyzed by the component mode synthesis method. The component mode synthesis method is a general method of analysis of the vibration of a complex mechanical structure using the natural modes of the components. A structure is divided into some components. All components are classified into master components and branch ones. The natural modes of each component are determined by the finite element method. The natural modes of all components are synthesized to form the generalized system coordinates. The equation of motion under these system coordinates is solved to know the vibration of the total structure. (11 refs.)

106986 On the reduction of the order of equations of motion of gyrostat in an axisymmetric field. H.M.Yehia (Dept. of Math., Mansoura Univ., Mansoura, Egypt).
J. Mec. Theor. & Appl. (France), vol.2, no.3, p.451-62 (1983).
The problem of motion of a gyrostat about a fixed point in a field of force with axisymmetric potential is reduced to a single second order differential equation in two of the direction cosines of the axis of symmetry with respect to the principal axes of the gyrostat at the fixed point. This equation is used in the study of stability of the pendulum-like motions of a heavy gyrostat. (21 refs.)

106987 A periodically forced piecewise linear oscillator. S.W.Shaw, P.J.Holmes (Dept. of Theoretical & Appl. Mech., Cornell Univ., Ithaca, NY, USA).
J. Sound & Vib. (GB), vol.90, no.1, p.129-55 (8 Sept. 1983).
A single-degree of freedom nonlinear oscillator is considered. The nonlinearity is in the restoring force and is piecewise linear with a single change in slope. Such oscillators provide models for mechanical systems in which components make intermittent contact. A limiting case in which one slope approaches

infinity, an impact oscillator, is also considered. Harmonic, subharmonic, and chaotic motions are found to exist and the bifurcations leading to them are analyzed. (29 refs.)

106988 Nonlinear induced oscillations of vibroshock systems. V.A.Bazhenov, V.I.Gulyaev, G.S.Kondakov, P.P.Lizukov (Kiev Engng. Building Inst., Kiev, Ukrainian SSR).
Strength Mater. (USA), vol.14, no.8, p.1138-43 (Aug. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.8, p.121-6 (Aug. 1982).
Considers a mechanical system whose position is determined by values of n independent generalized coordinates q_1, q_2, ..., q_n satisfying a relationship for a linkage on one side $f(q) \geq 0$. Let a force acting on the system have a force function U which may clearly depend on time t. The kinetic energy of the system is denoted in terms of K. (3 refs.)

106989 Determination of the dynamic characteristics of nonlinear vibrating systems by the measured motion. N.P.Plakhtienko (Inst. of Mech., Acad.of Sci., Kiev, Ukrainian SSR).
Strength Mater. (USA), vol.14, no.10, p.1368-74 (Oct. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.10, p.72-7 (Oct. 1982). [received: Sept. 1983]
Explains the method of determining the dynamic characteristics of mechanical vibrating systems taking into account the factors of nonlinearity. The data obtained in computer simulation are also presented. (10 refs.)

46.20 CONTINUUM MECHANICS

(see also 03.40 General mathematical aspects)

106990 On volume fraction theories for discretized materials. A.Bedford (Univ. of Texas, Austin, TX, USA), D.S.Drumheller.
Acta Mech. (Austria), vol.48, no.3-4, p.173-84 (1983).
Materials which are in discretized form, such as granular materials or a distribution of bubbles, can exhibit microstructural effects associated with the local deformations of the microelements. A theory in which new kinematical variables are introduced to model the dilational motions of the microelements is called a volume fraction theory. It is argued that two types of local motion should be considered—dilatation of the microelements and their dilatational motion relative to one another—and that two of the three variables volume fraction, partial density and density, are necessary to model them. As an example, the theory of granular materials due to Goodman and Cowin is generalized by modeling the local dilatational motions in terms of the partial density and the density of the material. (25 refs.)

106991 Dynamic formulation of heterogeneous rectangular section rod. M.Touratier.
J. Mec. Theor. & Appl. (France), vol.2, no.3, p.307-24 (1983). In French.
Proposes a dynamic formulation for rectangular cross-section heterogeneous rods. The rod is composed of nine homogeneous rods, of rectangular sections and different orthotropic materials. The model is constructed from basic elements and uses a variational method (stress and displacements) with a view to satisfying interface continuity conditions for the basic elements, and boundary conditions for the heterogeneous rod. The stress equations for stress movement and the constitutive equations are established in the general case for the nine elements. For the two axes of geometrical and material symmetry, the longitudinal motion is uncoupled, while flexion and torsion motions are always coupled. (9 refs.)

106992 Numerical determination of limit loads for an axisymmetrical orthotropic material in plane strain. J.Pastor, S.Turgeman.
J. Mec. Theor. & Appl. (France), vol.2, no.3, p.393-416 (1983). In French.
Presents a limit analysis study of an axisymmetrical orthotropic material system which obeys a Boehler and Sawczuk (1970) yield criterion. In order to obtain a numerical approach for the load limits of the system under study, an extension of the static and kinematic programmes previously elaborated for an isotropic medium is advanced. The programmes derived are applied to the problem of the bearing capacity of a strip footing. The influence of the variations of the anisotropic parameters is also investigated, as is the position of the orthotropic axis and the nature of the soil-foundation interface. (18 refs.)

106993 Shallow shell with a rigid linear inclusion along the curvature line. D.V.Grilits'ku, V.K.Opanasovich, I.P.Shats'ku.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.8, p.28-30 (1983). In Ukrainian.
A problem concerning the stress distribution in the vicinity of the rigid linear inclusion oriented along the principal curvature line of the shallow shell is solved using the singular integral equations. Asymptotic analytical expressions are obtained for the stress intensity factors. (1 ref.)

106994 A method of special weight functions in the problem of parametric identification of mechanical systems. N.P.Plakhtienko.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.8, p.31-5 (1983). In Ukrainian.
A method of parametric identification of nonlinear mechanical systems is suggested. It is based on the integral transformation of motion equations with special weight functions. The weight functions are selected in such a way that if the system is nonlinear in displacements (velocity, accelerations), its identification is performed on the basis of information delivered by the displacement (velocity, accelerations). Results of computer-aided simulation are presented showing that the identification algorithms do not increase errors of experimental data measurement. (6 refs.)

106995 On point spectrum of one class of open cylindrical structures. A.E.Poedinchuk.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.8, p.53-7 (1983). In Ukrainian.
The quasinatural frequencies of a nonclosed circular cylindrical surface are shown to form a countable isolated subset of a complex plane without finite limit points. (9 refs.)

106996 Variational approach by means of adjoint systems to structural optimization and sensitivity analysis. I. Variation of material parameters within fixed domain. K.Dems (Lodz Tech. Univ., Lodz, Poland), Z.Mroz.
Int. J. Solids & Struct. (GB), vol.19, no.8, p.677-92 (1983).
For a linear elastic structure, the first variation of an arbitrary stress, strain and displacement functionals corresponding to variation of material parameters within specified domain is derived by using the solution for primary and adjoint systems. This variation is of fundamental importance in sensitivity analysis, optimal design and identification problems. Simple examples of optimal stiffness design and identification of stiffness parameters in beams are presented. (8 refs.)

106997 The effective moduli of short-fiber composites. J.Aboudi (Dept. of Solid Mech., Materials & Structures, Tel-Aviv Univ., Ramat-Aviv, Israel).
Int. J. Solids & Struct. (GB), vol.19, no.8, p.693-707 (1983).
A first order continuum theory with microstructure is developed for aligned short-fiber composites. The fibrous material is modeled by a triply periodic array of rectangular parallelpiped elastic fibres which are embedded in an elastic matrix. A proper reduction of the theory, by which the microstructure variables are eliminated, yields the effective moduli of the short-fiber composite. The overall elastic constants of the three specific situations of long-fiber composites, particulate composites and periodically bilaminated media, are obtained as special cases. The reliability of the predicted effective moduli is verified by numerous comparisons with available experimental results in various cases. (17 refs.)

106998 Optimal plastic design of stiffened shells. C.Cinquini (Dept. of Structural Mech., Univ. of Pavia, Pavia, Italy), M.Kouam.
Int. J. Solids & Struct. (GB), vol.19, no.9, p.773-83 (1983).
Deals with the variational formulation of the optimum design of plastic cylindrical shells with stepwise varying thickness and stiffeners at joints (sections between two contiguous elements). The optimality criterion is attained by using a variational formulation. The saving achieved by using stiffeners is shown by means of an example. (19 refs.)

106999 A singular hybrid finite element analysis of boundary-layer stresses in composite laminates. S.S.Wang, F.G.Yuan (Dept. of Theoretical & Appl. Mech., Univ. of Illinois, Urbana, IL, USA).
Int. J. Solids & Struct. (GB), vol.19, no.9, p.825-37 (1983).
The laminate elasticity basis and the fundamental solution structure for the boundary-layer field are briefly reviewed first. Formulation of a singular composite-edge element is based on the recently developed boundary-layer theory and the variational principle of a modified hybrid functional. The singular hybrid element is used conveniently in conjunction with displacement-based conventional elements. Numerical solutions for the well-known Pipes-Pagano problem are presented for illustraton. Comparisons of the present solution with the laminate elasticity solution and conventional finite element results are made to demonstrate the accuracy and efficiency of the present approach. Influences of eigenfunction truncation, size and aspect ratio of the singular hybrid element as well as mesh configuration are studied. (29 refs.)

107000 On the static and kinetic methods of conservative system stability and Rayleigh's principle: a reexamination. J.G.Papstavridis (School of Engng. Sci. & Mech., Georgia Inst. of Technol., Atlanta, GA, USA).
J. Sound & Vib. (GB), vol.90, no.1, p.51-8 (8 Sept. 1983).
The relation between the static and kinetic variational methods of the stability of equilibrium analysis of conservative systems and the corresponding static and kinetic Rayleigh's principles is reexamined. Specifically made explicit are the connections between (i) the virtual work principle (for the adjacent equilibrium configuration) and Rayleigh's principle of extremum critical loads and buckled modes, and (ii) Hamilton's principle (for the adjacent nonequilibrium configuration) and Rayleigh's principle of extremum frequencies and mode shapes, through simple familiar examples. These connections are found by considering, in addition to the familiar mode amplitude variations, variations of the load which in turn produce variations in the space (i) and time (ii) domain lengths, respectively; one is thus led to a variable endpoints variational problem (instead of the customary fixed endpoints one) which, by invoking the energetics of these adjacent configurations, is simplified and finally brought to the standard Rayleigh's principle form. 46.30 MECHANICS OF SOLIDS AND RHEOLOGY

(see also 62.20 Mechanical properties of solids, as related to microscopic structure)

107001 Three dimensional stress state in an internally-pressurised hollow cylinder with a reinforcing ring. H.Kasano, K.Aoyagi, H.Matsumoto, I.Nakahara (Tokyo Inst. of Technol., Tokyo, Japan).
Bull. JSME (Japan), vol.26, no.215, p.700-7 (May 1983).
An internally-pressurized hollow cylinder with a reinforcing ring is studied within the framework of the three dimensional elasticity theory, and the effects of the ring width and the cylinder thickness on the stresses and deformations as well as contact pressure are examined. It is assumed that there are no shear stresses in the contact zone. The use of Dougall's stress function and method of Fourier transforms then leads to a dual integral equation, which is reduced to simultaneous algebraic equations by use of a series expansion method. (7 refs.)

107002 Thermal stress concentrations in the transient two-dimensional temperature field. II. Plate with a semi-elliptic notch. M.Furukawa (Kobe Univ. of Mercantile Marine, Kobe, Japan), M.Hamada, H.Kitagawa, T.Fukuoka.
Bull. JSME (Japan), vol.26, no.215, p.708-15 (May 1983).
The transient thermal stress concentration of a notched semi-infinite plate is analysed numerically. The plate which is initially in a uniform temperature state is assumed to be heated along the straight and notched boundaries through a fluid touching directly on it. The notch shapes are semi-elliptic with various radius ratios. A finite-difference method is used both for temperature and stress analyses. The finite-difference mesh is formed on basis of the equi-potential and flow lines in the potential flow around an elliptic cylinder. It is found by this method that the thermal stress concentration increases with time and the Biot number of heat convection. An approximate method, by which the stress concentration factor of a semi-elliptically notched strip with finite width can be estimated, is proposed. (10 refs.)

46.30C Static elasticity

107003 A note on the solution of two finite plain strain problems. C.Perdikis (Univ. of Ioannina, Ioannina, Greece).
Acta Mech. (Austria), vol.48, no.3-4, p.203-8 (1983).
Previously (see ibid., vol.43, p.159, 1982) the solution of the boundary-value problems for finite plane deformation of compressible isotropic hyperelastic materials of harmonic type with an elliptical hole was found in integral form.

The author gives a solution of these problems which is more explicit, and not in integral form. To do this, it is necessary to choose particular forms of the functions Ψ^{-1} and Φ^{-1} which agree with known expressions of these functions in the limit $x \to 2$. (2 refs.)

107004 Use of initial parameters method in calculations of nonlinear behaviour of shells of revolution. A.V.Korovaitsev.
Izv. VUZ Mashinostr. (USSR), no.7, p.148-50 (1983). In Russian.
The axisymmetric problems of the deformation of elastic shells when subject to large displacements are considered. When the problems are solved by means of parametric differentiation it is shown to be possible to use the initial parameters method to investigate the behaviour of the shell over a wide range of nonlinearity. (3 refs.) *L.M.H.*

107005 Transient thermal stresses in a rectangular plate due to variation of heat-transfer coefficients on upper and lower surfaces. Y.Sugano (Dept. of Mech. Engng., Univ. of Osaka Prefecture, Osaka, Japan).
Int. J. Eng. Sci. (GB), vol.21, no.10, p.1203-14 (1983).
Presents a method for the determination of the transient temperature and thermal stresses in a thin finite rectangular plate subjected to the distinct thermal boundary conditions of the third kind at the four edges and allowing the variation of heat transfer coefficients on the upper and lower surfaces of the plate. (4 refs.)

107006 An energy estimate for the biharmonic equation and its application to Saint-Venant's principle in plane elastostatics. J.K.Knowles (Div. of Engng. & Appl. Sci., California Inst. of Technol., Pasadena, CA, USA).
Indian J. Pure & Appl. Math., vol.14, no.7, p.791-805 (July 1983).
A new energy estimate is given for a boundary value problem for the biharmonic equation. The result is applied to the estimation of stresses in a plane elasticity problem. (15 refs.)

107007 Interfacial matrix stresses in composites due to misfitting cylindrical constituents. P.J.Fritz, R.A.Queeney (Dept. of Engng. Sci. & Mech., Pennsylvania State Univ., University Park, PA, USA).
J. Compos. Mater. (USA), vol.17, no.3, p.224-30 (May 1983).
Examines the matrix stress fields at the interface between the matrix and hexagonal arrays of misfitting cylinders. Stresses were analyzed using the photoelastic method, wherein the matrix was the photoelastic material. As the nearest-neighbor cylindrical inclusions first approach each other, there is a tendency for both radial compression and tensile hoop stress components to increase beyond values predicted for single, isolated inclusions. At nearest-neighbor separations less than 40% of the cylindrical inclusion diameter, however, the contact pressure between reinforcement and matrix decreases. At the same time, the tensile hoop component increases markedly, less so in the hexagonal array than for two inclusions. The physical positioning and arraying of the reinforcement will clearly determine the local stress induced by processing, which, in turn, will influence composite response and service endurance. (6 refs.)

107008 Response of an orthotropic cylindrical shell to sudden heating. H.Ray (Dept. of Mech. & Aerospace Engng., Rutgers Univ., New Brunswick, NJ, USA).
Nucl. Eng. & Des. (Netherlands), vol.74, no.3, p.309-16 (1982).
The parametric resonance of thin elastic orthotropic cylindrical shells in plane strain to suddenly developed uniform temperature is investigated. The shells are fabricated from laminated fiber-reinforced composite materials. The short-term analysis identifies the excitation of particular unstable modes. The long-term analysis shows that the initially unstable circumferential flexural modes exchange energy with the circular mode in a cyclic manner. If the flexural motion is excited, the resulting displacements and stresses are substantially larger than the initial membrane values. The effects of temperature applied as a step function, shell geometry, number of layers, and fiber orientation are shown. (9 refs.)

107009 Maximum strength/stiffness design of structural members in presence of self-weight. B.L.Karihaloo, W.S.Hemp (Dept. of Engng. Sci., Univ. of Oxford, Oxford, England).
Proc. R. Soc. London Ser. A (GB), vol.389, no.1796, p.119-32 (8 Sept. 1983).
Presents the maximum strength/stiffness design of tension/compression and flexural members under the influence of their self-weight as well as given external forces. In the maximum strength design, all cross sections of the member attain the maximum allowable stress for the material; the design is therefore also referred to as the uniform or constant maximum strength design. In the maximum stiffness design, the maximum longitudinal or transverse displacement is minimized. It is assumed that the location of the maximum displacement is known. In this sense, the paper considers only strict minimization problems. In several cases analytical solutions are obtained. Where this was not possible, solutions derived by successive approximation are given. The variational problem corresponding to this optimization problem has several unique features which are not commonly encountered in the absence of self-weight. (14 refs.)

107010 Approximate closed solutions of the axisymmetric problem of deformation of an inhomogeneous disk of arbitrary profile. M.L.Kozlov (Inst. of Appl. Problems of Mech. & Math., Acad. of Sci., L'vov, Ukrainian SSR).
Strength Mater. (USA), vol.14, no.8, p.1124-9 (Aug. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.8, p.110-14 (Aug. 1982).
A disk (a round thin plate of radius R_2 with a central circular hole of radius R_1) made of a material inhomogeneous with respect to the radius r is loaded by stresses σ_2 and σ_1 uniformly distributed respectively on the outside surface and the surface of the hold. Rotating with a constant angular velocity ω, the disk is located in an axisymmetric temperature field. The variable cross section of the disk of thickness H(r) is symmetric relative to the middle plane. The temperature T(r) and, as a consequence of the loading conditions, the radial and circumferential stresses σ_r, σ_θ are constant over the thickness of the disk. The unit forces $n_r = H(r)*\sigma_r$, $n_\theta = H(r)*\sigma_\theta$ are continuous along the radius, whereas the stresses can change markedly at places of a substantial change in the thickness of the disk. (9 refs.)

107011 A note on elastic plates fixed in position along a knife edge. P.Hagedorn (Inst. fur Mech., Tech. Hochschule Darmstadt, Darmstadt, Germany).
Z. Angew. Math. & Mech. (Germany), vol.63, no.7, p.326-9 (1983). In German.
An application of Reissner's extension (1945) of Kirchhof's treatment. The deformation is calculated from the sum of three solutions to Kirchhof problems. Further work will deal with other end conditions. (8 refs.) *N.C.*

46.30J Viscoelasticity, plasticity, viscoplasticity, creep, and stress relaxation

(inc. rheology of solids)

107012 Mathematical modelling of a flexible beam under gravity. F.Janssens (Math. Support Div., ESTEC, Noordwijk, Netherlands).
ESA J. (Netherlands), vol.7, no.2, p.195-208 (1983).
The differential equations describing the static deflections of a Bernouilli beam under gravity and a concentrated tip load are derived and solved. The solutions are used to predict tip deflections as a function of bending stiffness for a constant tip load. This relationship is then applied to the results of the static bending tests performed on the ISPM satellite's axial antenna to determine its bending stiffness. The results show clearly the importance of modelling gravity as a distributed load, even for light structural elements. (6 refs.)

107013 Stress-strain state of multiple-layered structures subject to pulsed loading. V.P.Sizov, S.I.Shumarin.
Izv. VUZ Mashinostr. (USSR), no.7, p.13-17 (1983). In Russian.
The pulsed loading of a multiple-layered structure is considered which is capable of concentrating stress at its internal points. Some ways of designing structure capable of reducing the concentration of the stress are shown. (4 refs.) *L.M.H.*

107014 Calculating shell of rotation by finite element method when material operates beyond limit of elasticity. A.P.Nikolaev, N.G.Bandurin.
Izv. VUZ Mashinostr. (USSR), no.7, p.17-21 (1983). In Russian.
The theory of plastic flow is used as the basis for proposing an algorithm for the creation of a matrix rigidity of a curvilinear rectangular finite element when a material is operating beyond the limit of elasticity. (4 refs.) *L.M.H.*

107015 Riemann and Goursat problems for one-dimensional classical plasticity. C.Faciu (Dept. of Math., Nat. Inst. for Sci. & Tech. Creation, Bucharest, Rumania).
Int. J. Eng. Sci. (GB), vol.21, no.10, p.1215-29 (1983).
One-dimensional motions for a class of rate independent elastic-plastic materials are considered. Goursat and Riemann problems are investigated by means of similarity solutions. Uniqueness of the solution for both problems is ensured by adopting a physical principle stated by Suliciu (see Stud. Cerc. Mat., vol.25, p.53, 1973); moreover the solution itself is constructed in all the cases considered. (6 refs.)

107016 Large strain inelastic behaviour of cylindrical tubes. E.Chater, K.W.Neale (Faculte des Sci. Appliquees, Univ. de Sherbrooke, Sherbrooke, Quebec, Canada).
Int. J. Solids & Struct. (GB), vol.19, no.8, p.709-24 (1983).
The finite strain behaviour of thin-walled circular cylinders fixed at their ends and subjected to uniform internal pressure is examined. General transversely isotropic inelastic properties are assumed, and both time-independent plastic (elastoplastic) and rate-sensitive inelastic (viscoplastic) material response are considered. Flow theory and deformation theory-type constitutive laws are employed. The influence of constitutive properties and tube geometry on maximum pressure and localized necking instabilities is determined through finite element computations for selected types of anisotropy. Simple relations are developed for the pressure-deformation response and instability of general transversely isotropic materials, and these are shown to be very accurate for long tubes. The accuracy of elementary formulae commonly used in experimental investigations of constitutive relations is also discussed. (17 refs.)

107017 Evaluation of a uniaxial, nonlinear, second-order differential overstress model for rate-dependence, creep and relaxation. E.P.Cernocky (Dept. of Mech. Engng., Univ. of Colorado, Boulder, CO, USA), E.Krempl.
Int. J. Solids & Struct. (GB), vol.19, no.9, p.753-66 (1983).
The properties of a second-order differential equation linear in the first and second time derivatives of stress and strain but nonlinear in the overstress are investigated. The extension to second-order time derivatives in this nonlinear constitutive equations follows similar methods in linear viscoelasticity. The behavior of the second-order equation is compared with that of the first-order equation. Phase-plane analysis and Poincare-linearization are used to show that the first and second-order equations exhibit the same long time limits for constant stress(strain)-rate loading. Numerical integration involving strain(stress)-rates differing by four orders of magnitude and strain(stress)-rate jumps demonstrates that the limits are rapidly attained and that the transient behavior of the second-order equation can be different from that of the first-order equation. Strong and mild oscillatory behavior as well as monotonic behavior is possible in strain control. Stress control always results in monotonic behavior. For creep and relaxation the inelastic strain is a functional of the overstress history and the large time limit corresponds to that of the first-order equation. (25 refs.)

107018 Plane strain extrusion studies by finite element method. A.K.Tayal (Delhi Coll. of Engng., Delhi, India), R.Natarajan.
J. Inst. Eng. (India) Mech. Eng. Div., vol.63, pt.ME1, p.31-4 (July 1982). [received: Aug. 1983]
The metal flow under plane strain conditions through square, wedge shaped and unsymmetric dies in direct extrusion and also in inverted extrusion through a square die were studied using a viscoplastic model finite element method. Extrusion pressures were calculated, and strain rate contours, velocity vectors and hydrostatic pressure distribution were evaluated. This additional information brings out distinctly the many features of plane strain extrusion. Agreement of the results with practical observations of other investigators is

also reported besides the general agreement with the theoretical predictions. This has been done as a part of the broader assessment of the finite element technique for the solution of metal flow problems. (15 refs.)

107019 Determining the critical number of revolutions for a disk equal in strength during creep. A.f.Nikitenko (Inst. of Hydrodynamics, Acad. of Sci., Novosibirsk, USSR).
Strength Mater. (USA), vol.14, no.8, p.1012-15 (Aug. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.8, p.15-18 (Aug. 1982).
In some cases it is possible to obtain equality in strength of a design element of specified geometry by the proper selection of external loads and temperature. This problem is solved for the case of a nonuniformly heated disk of variable thickness with a hole. For it a system of equations decribing all three stages of creep of a material with simultaneous taking into consideration of the process of accumulation of damages in it is used. A disk of constant thickness and a uniformly heated disk are considered as particular cases. (7 refs.)

107020 Phenomenological model of the description of deformation and failure and metals under complex nonisothermal loading. G.N.Kuvyrkin (N.E. Bauman Higher Tech. School, Moscow, USSR).
Strength Mater. (USA), vol.14, no.8, p.1034-6 (Aug. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.8, p.35-7 (Aug. 1982).
A phenomenological model of failure is given. In constructing the determining relationships it was assumed that the 'lifetime' of the structure depends mainly on the time of accumulation of dispersed damages of the pore and microcrack type. The form of these damages was not taken into account, nor were extreme cases of purely ductile and purely brittle fracture investigated. (9 refs.)

107021 Elastoplastic behavior of a laminar-fibrous material. V.P.Bagmutov (Volgograd Polytech. Inst., Volgograd, USSR).
Strength Mater. (USA), vol.14, no.10, p.1397-404 (Oct. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.10, p.96-102 (Oct. 1982). [received: Sept. 1983]
The method of layered sectioning is used to examine the elastoplastic behaviour and strength of a laminar-fibrous composite (LFC) with allowance for temperature effects. (9 refs.)

107022 On the motion of a viscoelastic solid in presence of a rigid wall. I. Darboux and general Cauchy problems for a third-order hyperbolic operator: explicit Riemann function and maximum principles. B.D'Acunto, A.D'Anna, P.Renno (Istituto di Meccanica Razionale, Univ. di Napoli, Napoli, Italy).
Z. Angew. Math. & Phys. (Switzerland), vol.34, no.4, p.421-38 (July 1983).
This is the first of two papers whose aim is the analysis of a unilateral problem related to the unidimensional motion of a viscoelastic standard linear solid $\mathcal{B}$ in presence of a rigid rectilinear wall. The line of influence of the wall, which represents the free boundary of the problem, plays an essential role. To construct the solution, the explicit Riemann function of the third-order hyperbolic operator which characterizes the motions of $\mathcal{B}$ is determined. Therefore the Darboux problem and the general Cauchy problem with initial data prescribed on arbitrary curves $t=t(x)$ of the xt-plane are explicitly solved. Furthermore, appropriate maximum theorems, necessary to verify the inequality of the constraint and to conjecture an admissible dynamic of the impact for the viscoelastic case dealt with, are stated. (27 refs.)

107023 Flexure of beams with certain curvilinear cross sections. S.A.Obaid (Div. of Maths. & Computer Sci., Univ. of Texas, San Antonio, TX, USA).
Z. Angew. Math. & Phys. (Switzerland), vol.34, no.4, p.439-49 (July 1983).
Special complex variables techniques are used to obtain the six flexure functions (one of which is the torsion function) of a certain isotropic cylinder under flexure. The cross section is bounded by the closed curve $r=a \sin^4(\theta/4)(-\pi<\theta\leq\pi)$. The torsional rigidity, moment integrals, and the associated twist are also evaluated for this beam. It is worthy to mention that these techniques work successfully when they are applied to any of the cross sections bounded by $r=a|\sin(\theta/n)|^n.(-\pi<\theta\leq\pi)$, where n is a positive integer $(n>1)$. 107024 Buckling by progressive plastic deformation under cyclic additional loading. Q.S.Nguyen, G.Gary (Lab. de Mecanique des Solides, Ecole Polytech., Palaiseau, France).
J. Mec. Theor. & Appl. (France), vol.2, no.3, p.351-73 (1983). In French.
The interaction between buckling and ratchetting under cyclic additional loading is discussed for elastic-plastic structures. It is shown that the risk of progressive plastic deformation is greater in the presence of prestresses and this phenomenon can lead to the buckling of a structure as a consequence of the resulting additional displacements. This interaction has been studied in the literature only very recently; it is particularly strong in perfect plasticity. For positive strain hardening materials, an estimate of the primary loading is given in order to evaluate the possibility of ratchetting. When the primary load is smaller than the smallest critical load of tangent modulus, elastic and plastic shake-down conditions are established. (19 refs.)

107025 On fibre stability in the die under nonuniform precritical deformations. I.N.Garashchuk.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.8, p.24-7 (1983). In Ukrainian.
An elastic fibre with a circular cross-section in the unbounded elastic medium is studied for its stability. The investigations were made within the second version of a three-dimensional linearized stability theory under small deformations with regard for the material structure. (9 refs.)

107026 Stability of plastic extension of anisotropy hardened bodies. G.D.Del', D.V.Khvam, A.N.Balakirev.
Izv. VUZ Mashinostr. (USSR), no.7, p.8-9 (1983). In Russian.
An account of plastic extension-compression is given to provide the argument to support the theoretical possibility of increasing the critical strain, up to which the plastic deformation is stable, given that the plastic deformation processes are non-monotonic. Experimental data obtained by extension-torsion-extension etc. testing of specimens are shown to confirm the existence of an increase in the critical strain in the loading cycle under investigation compared with simple extension. (no refs.) *L.M.H.*

107027 The existence of regions of divergence instability for nonconservative systems under follower forces. A.N.Kounadis (Nat. Tech. Univ. of Athens, Athens, Greece).
Int. J. Solids & Struct. (GB), vol.19, no.8, p.725-33 (1983).
In this investigation, the existence of regions of divergence instability for an elastically restrained column under a follower compressive force at its end is discussed. Necessary and sufficient conditions for the existence of regions of divergence instability are established. The boundary between flutter and divergence instability passes always through a double critical point, where the first and second static (buckling) eigenmodes coincide. The eigenvalues (buckling loads) of nonself-adjoint problems of this type are positive and distinct for the entire region of divergence instability, except at its boundary, where the first and second eigenvalues coincide. At this boundary, where the buckling mechanism changes from divergence to flutter and vice-versa, a sudden increase in the critical load occurs with the flutter load always being higher than the corresponding divergence load. (11 refs.)

107028 On axial and lateral buckling of end-loaded anisotropic cantilever beams. E.Reissner (Dept. of Appl. Mech. & Engng. Sci., Univ. of California, San Diego, La Jolla, CA, USA), J.E.Reissner.
Z. Angew. Math. & Phys. (Switzerland), vol.34, no.4, p.450-7 (July 1983).
Obtains results for axial and lateral buckling loads in accordance with Euler and Michell-Prandtl for a cantilever acted upon by end bending moments, and by a combination of axial and transverse end forces. The nonconventional aspects of the solutions are that the authors assume anisotropy, in the sense that bending strains as well as twisting strains are taken to be linear combinations of bending and twisting moments acting over the cross section of the beam. 107029 Flutter loads of a Timoshenko beam-column under a follower force gorverned by two variants of equations of motion. J.T.Katsikadelis, A.N.Koundadis (Nat. Tech. Univ. of Athens, Athens, Greece).
Acta Mech. (Austria), vol.48, no.3-4, p.209-17 (1983). (17 refs.)

107030 Vibrations of noncircular cylindrical shells. K.Suzuki, S.Tamura, T.Kosawada, S.Takahashi (Faculty of Engng., Yamagata Univ., Yonezawa, Japan).
Bull. JSME (Japan), vol.26, no.215, p.818-26 (May 1983).
The authors describe a method for analyzing free vibrations of thin cylindrical shells with noncircular cross sections which have been used in chemical plants, atomic plants, flight structures and so on. This method is a general one applicable to various noncircular cylindrical shells. As the first step, an exact solution is obtained for a noncircular cylindrical shell with freely supported ends. By the numerical calculations, natural frequencies and mode shapes of elliptical cylindrical shells are derived and their characteristics, are clarified. (9 refs.)

107031 Torsional impact response of a penny-shaped crack lying on a bimaterial interface. S.Ueda, Y.Shindo, A.Atsumi (Dept. of Mech. Engng. II, Tohoku Univ., Sendai, Japan).
Eng. Fract. Mech. (GB), vol.18, no.5, p.1059-66 (1983).
The torsional impact response of a penny-shaped crack lying on a bimaterial interface is considered in this study. Laplace and Hankel transforms are used to reduce the problem to the solution of a pair of dual integral equations. The solution to the dual integral equations is expressed in terms of a Fredholm integral equation of the second kind with a finite integral kernel. A numerical Laplace inversion routine is used to recover the time dependence of the solution. The dynamic stress intensity factor is determined and its dependence on time and material constants is discussed. (5 refs.)

107032 On the behaviour of shock waves in deformable dielectric materials. B.Collet (Lab. de Mecanique Theorique, Univ. Pierre et Marie Curie, Paris, France).
Int. J. Eng. Sci. (GB), vol.21, no.10, p.1145-55 (1983).
Examines the behaviour of plane shock waves propagating in elastic dielectrics. The differential equation governing the amplitude of wave and formulae concerning the polarization changes across the shock are deduced. Some particular situations are studied in detail. (18 refs.)

107033 Variational estimates for dispersion and attenuation of waves in random composites. III. Fibre-reinforced materials. D.R.S.Talbot, J.R.Willis (School of Math., Bath Univ., Bath. England).
Int. J. Solids & Struct. (GB), vol.19, no.9, p.793-811 (1983).
For pt.II see ibid., vol.18, no.8, p.685 (1982). The variational approach developed in Parts I and II is applied to some two-dimensional problems of waves propagating transversely to the fibres in a unidirectional fibre-reinforced composite. Estimates of wave speeds (both bounds and self-consistent estimates) and associated estimates for the attenuation of the mean wave are given for long waves. They are studied in detail for the case of SH waves propagating through materials reinforced by aligned elliptic cylinders. All of the results are sensitive to the statistics of the medium. This is illustrated by considering two distinct pair distribution functions. Simple closed-form expressions are given for the limiting cases of a body weakened by aligned cracks and a body strengthened by aligned rigid plates. By-products of the analysis include a new representation for the two-dimensional dynamic Green's function for an anisotropic medium and an expression in the Rayleigh limit for the scattering cross-section of a single elliptic cylinder in a uniform matrix, both of which may be anisotropic. (18 refs.)

107034 Free vibration of a circular plate elastically restrained along some radial segments. T.Irie, G.Yamada, K.Tanaka (Dept. of Mech. Engng., Hokkaido Univ., Sapporo, Japan).
J. Sound & Vib. (GB), vol.89, no.3, p.295-308 (8 Aug. 1983).
An analysis is presented for the free vibration of a circular plate restrained against deflection along radial segments. With the reaction forces acting on the segments regarded as unknown harmonic loads, the stationary response of the plate to these loads is expressed by the use of the Green function. The force distributions along the segments are expanded into Fourier series with unknown coefficients, and the homogeneous equations for the coefficients are derived by restraint conditions on the supports. The natural frequencies and the mode shapes of the plate are determined by calculating the eigenvalues and eigenvectors of the equations. The method is applied to circular plates supported along several radial segments located at equal angular intervals, the natural frequencies and the mode shapes of the plates are calculated numerically and the effect of the supports is discussed. (17 refs.)

107035 Frequency average loss factors of plates and shells. M.F.Rank, B.L.Clarkson (Inst. of Sound & Vibration Res., Univ. of Southampton, Southampton, England).
J. Sound & Vib. (GB), vol.89, no.3, p.309-23 (8 Aug. 1983).
Describes a thorough investigation of the measurement of frequency band average loss factors of structural components for use in the statistical energy analysis (SEA) method of computation of vibration levels. The 'traditional' method of measurement is to excite the structure by a random force having a flat spectral density in the frequency band of interest. The force is then cut off and the decay of the modes excited in the band is noted. The average loss factor is deduced from the decay curve. The alternative energy method is the subject to this study. In this test the power input from the band limited random force is measured and the spatial average vibration level of the structure is estimated from several surface accelerometers. It is shown that when the modes in the band have similar loss factors (as is usually the case) the energy method gives a result which is very close to that obtained from the decay method. These in turn are close to the arithmetic average of the loss factors of the individual modes in the band. It is shown that only when the band contains one or two very lightly damped modes amongst several more heavily damped modes is there a difference between the two methods. In this case it is better to use the energy result in the SEA calculations. (3 refs.)

107036 Free vibration of annular sector plates by an integral equation technique. R.S.Srinivasan, V.Thiruvenkatachari (Dept. of Appl. Mech., Indian Inst. of Technol., Madras, India).
J. Sound & Vib. (GB), vol.89, no.3, p.425-32 (8 Aug. 1983).
A numerical method is presented for the free vibration analysis of polar orthotropic clamped annular sector plates. The results are compared with analytical and experimental values of other investigators. A parametric study has been done by varying the sector angle and radii ratio. The frequencies for isotropic and orthotropic cases are presented in the form of graphs. (13 refs.)

107037 Vibration and stability analysis of polar orthotropic uniform discs subjected to peripheral hydrostatic loading. D.G.Gorman (Dept. of Mech. Engng., Queen Mary Coll., London, England).
J. Sound & Vib. (GB), vol.89, no.4, p.477-86 (22 Aug. 1983).
An analysis based upon the annular finite element method is carried out of the transverse vibration and stability of uniform polar orthotropic discs subjected to peripheral hydrostatic loading. Both the axi- and anti-symmetrical modes are considered for both clamped and simply supported at the outer peripheral radius. By separation of the flexural and geometric (membrane) components, the effect on both with respect to the degree of orthotropy is plotted and subsequently both components can be easily combined to produce the natural frequencies of the loaded disc. A simple relationship is derived to determine whether the lowest critical buckling mode is that containing zero nodal diameters and circles or some higher mode. (14 refs.)

107038 Large amplitude vibration of an initially stressed moderately thick plate. L.-W.Chen, J.-L.Doong (Dept. of Mech. Engng., Nat. Cheng-Kung Univ., Tainan, Taiwan).
J. Sound & Vib. (GB), vol.89, no.4, p.499-508 (22 Aug. 1983).
Non-linear equations of motion for a transversely isotropic moderately thick plate in a general state of non-uniform initial stress where the effects of transverse shear and rotary inertia included are derived. The large amplitude flexural vibration of a simply supported rectangular moderately thick plate subjected to initial stress is investigated. The initial stress is taken to be a combination of pure bending stress plus an extensional stress in the plane of the plate. These equations are used to solve the vibrations problem by the Galerkin method. The effects of various parameters on the non-linear vibration frequencies are studied. (16 refs.)

107039 Beam vibrations with time-dependent boundary conditions. D.A.Grant (Dept. of Mech. Engng., Univ. of Maine, Orono, ME, USA).
J. Sound & Vib. (GB), vol.89, no.4, p.519-22 (22 Aug. 1983).
A procedure is outlined for the solution of the vibration problem of a Bernoulli-Euler beam with time-dependent boundary conditions. The solution is greatly simplified if the dependent variable in the original partial differential equation can be changed to produce homogeneous boundary conditions and at the same time maintain a homogeneous differential equation. A method for making such a change is given and illustrated by solving a cantilever beam problem with a time-dependent tip displacement. (7 refs.)

107040 Effect of an impact damper on a multi-degree of freedom system. M.M.Nigm, A.A.Shabana (Dept. of Mech. Engng., Ain Shams Univ., Abbasia, Cairo, Egypt).
J. Sound & Vib. (GB), vol.89, no.4, p.541-57 (22 Aug. 1983).
Theoretical analysis of the steady state vibrational motion of a multi-degree of freedom system equipped with an impact damper is presented. The analysis is based on the assumption that two generally distributed impacts occur in each cycle. The theory is applied to the special case of a single degree of freedom main system and the effects of various parameters are investigated. The theoretically possible modes of steady state behaviour of the damper is manifested by the existence of as many as three modes of steady state motion for a given exciting frequency. The conditions leading to more or less than two impacts/cycle are predicted although the system response under such conditions is not studied. Experimental results are presented and compared with theoretical prediction. (10 refs.)

107041 Vibration reduction over a frequency range. L.Kitis (Dept. of Mech. Engng., Worcester Polytech. Inst., Worcester, MA, USA), B.P.Wang, W.D.Pilkey.
J. Sound & Vib. (GB), vol.89, no.4, p.559-59 (22 Aug. 1983).
An efficient optimal design algorithm for minimizing the vibratory response of a multi-degree of freedom system under sinusoidal loading over several excitation frequencies is presented. The method is applicable to large scale dynamic systems because it incorporated an effective time-saving reanalysis approach to compute cost function and cost function derivatives. In particular, the efficiency of the method is demonstrated by applying it to the problem of designing two dynamic vibration absorbers simultaneously applied to an undamped cantilever beam. (30 refs.)

107042 A recursive approach to Prony parameter estimation. P.Davies (Inst. of Sound & Vibration Res., Univ. of Southampton, Southampton, England).
J. Sound & Vib. (GB), vol.89, no.4, p.571-83 (22 Aug. 1983).
The Prony series method of fitting a series of complex exponentials to a time series can be applied to many acoustic and vibration signals. For example, in the analysis of a structure's response to transient excitation the Prony series method can be used to find the natural frequencies, damping ratios, amplitudes and relative phases of the modes of the structure. One of the main problems with this method is the need to calculate and invert matrices. In this paper an algorithm that combines the Prony series method with the recursive least squares algorithm is described. This eliminates the need to invert any matrices and also requires only part of the data to be available at one particular time. The method is applied to analyze a simulated structure's response and also to analyze the response of a beam to transient excitation. (8 refs.)

107043 Coupled flexural-longitudinal wave motion in a periodic beam. D.J.Mead (Dept. of Aeronautics & Astronautics, Univ. of Southampton, Southampton, England), S.Markus.
J. Sound & Vib. (GB), vol.90, no.1, p.1-24 (8 Sept. 1983).
Periodic structure theory is used to study the interactions between flexural and longitudinal wave motion in a beam (representing a plate) to which offset spring-mounted masses (representing stiffeners) are attached at regular intervals. An equation for the propagation constants of the coupled waves is derived. The response of a semi-infinite periodic beam to a harmonic force or moment at the finite end is analyzed in terms of the characteristic free waves corresponding to these propagation constants. Computer results are presented which show how the propagation constants are affected by the coupling, and how the forced response varies with distance from the excitation point. The spring-mounted masses can provide very high attenuation of both longitudinal and flexural waves when no coupling is present, but when coupling is introduced the two waves combine to give very low (or zero) attenuation of the longitudinal wave. The influence of different damping levels on spatial attenuation is also studied. (7 refs.)

107044 Vibration and stability of a circular plate of unidirectionally varying thickness. T.Irie, G.Yamada, M.Kitayama (Dept. of Mech. Engng., Hokkaido Univ., Sapporo, Japan).
J. Sound & Vib. (GB), vol.90, no.1, p.81-91 (8 Sept. 1983).
An analysis is presented for the vibration and stability of an elastically restrained circular plate of unidirectionally varying thickness subjected to an in-plane force. For this purpose, the transverse deflection of a circular plate of variable thickness is written in a series of the deflection functions of a uniform circular plate without the action of a force. The dynamical energies of the plate are evaluated analytically, and the frequency equation of the plate is derived by the Ritz method. The analysis is applied to circular plates of unidirectionally tapered or stepped thickness: the natural frequencies and the divergence loads are calculated numerically, and the effects of the varying thickness and edge conditions on the vibration and stability are studied. (18 refs.)

107045 Forced vibrations and their damping. F.Ziegler.
Sitzungsber. Oesterr. Akad. Wiss. Math.-Naturwiss. Kl. Abt. II (Austria), vol.191, no.4-7, p.233-9 (1982). [received: Sept. 1983]
Knowing the elastic frequency response function in analytical form allows the application of the classical elastic-viscoelastic correspondence principle. Substitution of the complex viscoelastic moduli renders the viscoelastic frequency response function. For bodies with irregular shape only numerical solutions are possible and only a discrete frequency response spectrum within a finite band of forcing frequencies can be calculated (e.g. by FEM). Using an alternative quadrature type of the analogy together with data-fitting of a modal form of analytical series solution at resonances renders an approximate viscoelastic solution. Precision of the method is outlined for a test example of a hinged-beam in forced vibration. A complicated form of dampening law can be built into the procedure by the choice of an appropriate frequency dependent complex viscoelastic modulus. (5 refs.)

107046 Small transverse vibrations of layered circular plates. E.I.Grigolyuk, V.N.Kassikhin (Moscow Automech. Inst., Moscow, USSR).
Strength Mater. (USA), vol.14, no.10, p.1359-64 (Oct. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.10, p.65-8 (Oct. 1982). [received: Sept. 1983]
Considers small transverse axisymmetric free vibrations of thin circular three-layer plates. The packet is assumed to be noncompressible in the transverse direction and consist of different thicknesses of isotropic dissimilar supporting layers and a transversely isotropic filter. The outer layers operate in bending and tension, and, in addition, the inner layer experiences shear. The filler follows the broken line hypothesis. (5 refs.)

46.30N Fracture mechanics, fatigue, and cracks

107047 Singular stresses in a soft ferromagnetic elastic solid with a flat annular crack. Y.Shindo (Tohoku Univ., Sendai, Japan).
Acta Mech. (Austria), vol.48, no.3-4, p.147-55 (1983).
Following a linear theory for soft ferromagnetic elastic materials, the author investigates the axisymmetric problem for an infinite body with a flat annular crack in a constant axial magnetic field. It is assumed that the soft ferromagnetic elastic solid is a homogeneous and isotropic one. Using an integral transform technique, the problem is reduced to that of solving a singular integral equation of the first kind. The solution of the singular integral equation is obtained in the form of the product of the series of Chebyshev polynomials of the first kind and their weight function. Thus the essential feature of the singular stress field near the crack is preserved and the crack tip stress-intensity factor is easily evaluated. (9 refs.)

107048 On the validity of the singular integral equations of crack problems at the crack tips. N.I.Ioakimidis (Univ. of Patras, Patras, Greece).
Acta Mech. (Austria), vol.48, no.3-4, p.185-91 (1983).
The validity of singular integral equations (with Cauchy type kernels) of the first kind and with index equal to 1 at the end-points of the integration interval is shown under mild continuity assumptions. The singular integral becomes now a divergent integral and has to be interpreted as a finite-part integral. This result is applicable to crack problems in elasticity theory and to the methods for the numerical solution of singular integral equations. As an application, the 'natural' extrapolation formula for the determination of the stress intensity factors at the crack tips is obtained. The generalization of the present results to the case of singular integral equations of the second kind is also considered. (15 refs.)

107049 A method for obtaining stress intensity factor by FEM and its application to dynamic problem. II. A treatment for mixed mode cracks. H.Wada, Y.Takagi (Daido Inst. of Technol., Nagoya, Japan), T.Nishimura.
Bull. JSME (Japan), vol.26, no.215, p.685-91 (May 1983).
For pt.I see ibid., vol.25, p.1 (1982). In Part I the authors proposed a new method for obtaining the stress intensity factors for the opening mode cracks. The same method has been extended to the calculation of the stress intensity factors for the sliding mode cracks. The usefulness of the method has been tested with a number of rectangular plates having oblique straight cracks of various inclinations and lengths, and the results have turned out to be fairly satisfactory. In addition, a static problem of a rectangular plate with a pair of oblique cracks emanating from the boundary surface of a circular hole and a dynamic problem of a rectangular plate with an oblique straight crack are investigated. (23 refs.)

107050 Growth of ring-shaped edge cracks under reversed torsional fatigue. T.Matake, Y.Imai, T.Takase (Dept. of Mech. Engng., Nagasaki Univ., Nagasaki, Japan).
Bull. JSME (Japan), vol.26, no.215, p.692-9 (May 1983).
Mode III fatigue crack growth was studied using cylindrical specimens with ring-shaped edge cracks under reversed torsion. Cracks grew locally in Mode I making small branches but their macroscopic growth direction was perpendicular to the specimen axis. The crack depth was successively estimated by the compliance calibration method and the growth rate of torsional cracks was related to the applied stress intensity factor range ΔK_{III}. In torsion, friction must be considered together with mutual sliding of prefatigue crack surfaces. Consequently, the applied torsional torque should be modified in evaluating the effective stress intensity factor. Effect of the surface friction on the stress state around the crack tip was examined by an elastic-plastic finite element analysis. (11 refs.)

107051 Interference effect of notches. II. An experimental investigation on interference effect of notches on strengths and deformation properties of notched bar with double U-notches. T.Majima, K.Watanabe (Faculty of Engng., Chiba Univ., Chiba, Japan).
Bull. JSME (Japan), vol.26, no.215, p.724-32 (May 1983).
For pt.I see ibid., vol.26, p.179 (1983). An interference effect of notches on the strengths and deformation properties of rectangular and cylindrical specimens with double U-notches is investigated experimentally. The stress at which the tensile load vs. elongation curve begins to depart from its elastic slope also reduces due to the interference effect. The magnitude of the interference effect on this stress is the same degree as that on the general yield strength and is not predicted on the basis of the interference effect on the elastic stress concentration factor although the plastic region near the notch root is much smaller at this stress level than at general yielding. The interference effect on the notch tensile strength of the material with both weak strain-hardening and small total elongation can be predicted accurately from that on the yield point load or on the general yield strength. (6 refs.)

107052 The effect of pressure fluid on bursting of brittle materials. I. Bursting of cast iron cylinder under internal pressure. F.Nagai (Tokyo Inst. of Technol., Tokyo, Japan), T.Matsukura, Y.Sato.
Bull. JSME (Japan), vol.26, no.215, p.739-46 (May 1983).
Internal pressure tests are carried out on coated and naked cylinders made of cast iron to study the effect of pressure fluid on the bursting of brittle materials, with the following conclusions: (1) In the naked cylinder the strength under internal pressure differs depending on the pressure fluid. (2) In the naked cylinder having a constant diameter ratio, there is a remarkable size effect even with the same pressure fluid. (3) There is no size effect in the coated thin-walled cylinder. (7 refs.)

107053 On the crack energy density and energy release rate for an elasto-plastic crack. K.Watanabe (Inst. of Industrial Sci., Univ. of Tokyo, Tokyo, Japan).
Bull. JSME (Japan), vol.26, no.215, p.747-54 (May 1983).
The relation between crack energy density and load-displacement curve is discussed and a method to evaluate crack energy density from load-displacement curve is established. Also, the physical meaning of so-called J_{Ic}-test is clarified. A general expression of energy release rate for an elasto-plastic crack is obtained, which is available for completely elastic fracture, fracture accompanied with small scale yielding and also fracture accompanied with large scale yielding. The behavior of an elasto-plastic crack is explained from the standpoint of energy, and an error in Orowan-Irwin theory based on energy balance is pointed out. (15 refs.)

107054 Stiffness changes in unidirectional composites caused by crack systems. N.Laws (Dept. of Math., Cranfield Inst. of Technol., Cranfield, England), G.J.Dvorak, M.Hejazi.
Mech. Mater. (Netherlands), vol.2, no.2, p.123-37 (Aug. 1983).
Considers the development of constitutive equations for fibrous composites which contain a family of longitudinal slit cracks. The general theory in which the crack length is of the same order as the fiber diameter gives rise to a three-phase model. When the fiber diameter is much smaller than the crack length, the associated two-phase model is obtained. Detailed numerical results are given for selected systems. (19 refs.)

107055 Three-dimensional elastic-plastic finite element analysis of small surface cracks. G.G.Trantina, H.G.deLorenzi, W.W.Wilkening (Corporate Res. & Dev., General Electric Co., Schenectady, NY, USA).
Eng. Fract. Mech. (GB), vol.18, no.5, p.925-38 (1983).
Three-dimensional, elastic and elastic-plastic finite element analysis of small surface cracks was performed. The elastic analysis is in good agreement with other solutions. For a round surface with a radius equal to six times the crack depth, the K at the surface is about 4% higher than the K for a flat surface. The results of the elastic-plastic analyses show a unique variation of the effective K (J-integral) along the crack front with a decrease in K at the surface due to a lack of plane strain constraint and an increase in the effective K at the maximum depth point with increasing plasticity. Similar behaviour was observed for a semielliptical crack. Increasing the strain hardening exponent from 10 to 20 produced similar results with slightly higher effective Ks for high applied strains. These results are useful in understanding the fracture behaviour of small surface cracks. (8 refs.)

107056 Recent developments of experimental fracture mechanics in Greece. E.E.Gdoutos (Democritus Univ. of Thrace, Xanthi, Greece).
Eng. Fract. Mech. (GB), vol.18, no.5, p.1037-47 (1983).
Recent developments associated with the application of the method of caustics to fracture mechanics problems in Greece are reviewed. Results from a variety of these studies including propagating cracks, cracks in composite bodies, bending of cracked plates and bodies with rigid inclusions, are summarized. (25 refs.)

107057 Brief note on the stress intensity factor of elliptical cracks. J.Schijve (Dept. of Aerospace Engng., Delft Univ. of Technol., Delft, Netherlands).
Eng. Fract. Mech. (GB), vol.18, no.5, p.1067-9 (1983).
The stress intensity factor solution for an elliptical crack is presented where the imaginary K-values ($6>a$) are calculated from a series expansion of E(h), where E(h) is a complete elliptical integral of the second kind. (5 refs.)

107058 The behaviour of fatigue cracks subject to applied biaxial stress: a review of experimental evidence. E.W.Smith (Dept. of Production Technol., Massey Univ., Palmerston North, New Zealand), K.J.Pascoe.
Fatigue Eng. Mater. & Struct. (GB), vol.6, no.3, p.201-24 (1983).
Reviews the available published data. Crack propagation behaviour under biaxial stress is dictated by three parameters: stress biaxiality itself, which is defined here as the ratio of the in-plane principal stresses, crack angle with respect to the applied principal stress directions and stress intensity factor range. Depending on the first two parameters, cracks may grow in mode I, mode II or mixed-mode. Crack growth data have been presented using these three divisions. Two short sections have been included on initiation and cyclic stress/strain behaviour under biaxial stress to emphasise the fact that crack growth cannot be fully understood without knowing something of them. The accumulated data do not lead to adequate conclusions on either the qualitative or quantitative behaviour of cracks subject to cyclic in-plane biaxial stress. Reasons for the confusion and even contradiction of independent results are put forward and some discussion given to the possible directions of future experimental work. (77 refs.)

107059 Closure behaviour of surface cracks. N.A.Fleck (Cambridge Univ. Engng. Dept., Cambridge, England), I.F.C.Smith, R.A.Smith.
Fatigue Eng. Mater. & Struct. (GB), vol.6, no.3, p.225-39 (1983).
The fatigue crack closure response was investigated for a surface crack in BS4360 50B structural steel subjected to (1) constant amplitude loading and (2) constant amplitude loading interrupted by a single peak overload. Various compliance techniques were employed to determine closure behaviour. The crack mouth gauge measured the bulk, plane strain closure load, while the near tip strain gauge indicated the surface plane stress closure response. For constant amplitude loading it was found that the surface regions of a surface crack are closed for a greater portion of the load cycle than the maximum depth point. A single peak overload caused different closure and growth rate transients at the surface of the thumbnail crack and at the maximum depth point. For growth rates above 10^{-6} mm/cycle, such behaviour agrees with the response of a through crack when subjected to constant amplitude loading, and a single peak overload. (25 refs.)

107060 Estimating initiation times of secondary fatigue cracks in damage tolerance analysis. T.R.Brussat (Advanced Structures Technol. Dept., Lockheed California Co., Burbank, CA, USA).
Fatigue Eng. Mater. & Struct. (GB), vol.6, no.3, p.281-92 (1983).
Fatigue cracking of complex structure often involves several interacting cracks developing in a sequence of crack growth, arrest and reinitiation. A 'combined' method of damage tolerance analysis is presented which employs fracture mechanics concepts to calculate crack growth and fatigue data from notched coupons with the appropriate notch radius for the crack initiation phase. The notched coupon data, plotted as peak elastic notch stress vs. cycles to crack initiation, are shown to be applicable even when limited yielding occurs at the notch root. For several practical reasons it is recommended to select the initial crack size, a_i, for the crack growth phase to be as large as possible, but in accord with two selection criteria. First, a_i must be within a notch-root region wherein the elastic stress distributions near a variety of notches are virtually identical. Secondly, a_i must be small enough not to significantly influence the stress distributions for other cracks. The Combined Method is illustrated by means of an example involving fatigue crack growth along a widthwise row of holes in 305 mm wide test panels. (15 refs.)

107061 An equivalent procedure for the evaluation of the stress intensity factors of a radial crack in a disc. C.Shangchow (Dept. of Aircraft Engng., Northwestern Polytech. Univ., Xian, China).
Int. J. Eng. Sci. (GB), vol.21, no.10, p.1247-52 (1983).
Establishes an equivalent procedure, which reduces the stress intensity problems of a finite radially cracked circular disc to those of an infinite one.

Making use of the equivalent procedure, the values of the stress intensity factors can be easily obtained with high accuracy. (6 refs.)

107062 An annular crack in microelasticity. M.Lal (School of Studies in Math., Jiwaji Univ., Gwalior, India).
Int. J. Eng. Sci. (GB), vol.21, no.10, p.1269-83 (1983).
Studies the problem of an annular crack in a transverse field of constant uniaxial tension by applying the linear theory of microelasticity. By means of Hankel transforms and tiple integral equations the problem is reduced to a set of simultaneous equations and is then solved numerically. The numerical results of physical interest are illustrated graphically and compared with those of the coupled stress theory. The classical results are presented as limiting case. (15 refs.)

107063 Dynamic kinking of a crack in plane strain. P.Burgers (Dept. of Mech. Engng. & Appl. Mech., Univ. of Pennsylvania, Philadelphia, PA, USA).
Int. J. Solids & Struct. (GB), vol.19, no.8, p.735-52 (1983).
The kinking of an initially stationary crack in a linear elastic body due to dynamic loading is solved using linear superposition to construct dual singular integral equations, which are solved numerically. The results for stress wave loading as well as loading on the crack faces only are presented, with an estimated accuracy of better than 3%. Some conclusions on crack velocity and kink angle are drawn for a fracture criterion which requires $K_{II}=0$. (20 refs.)

107064 Extremum principles for the energy-release problem of elastic-perfectly plastic body subjected to prescribed change of material properties. P.Rafalski (Reactor Engng. Dept., Inst. of Nuclear Res., Warsaw, Poland).
Int. J. Solids & Struct. (GB), vol.19, no.9, p.767-71 (1983).
Two extremum principles for the energy-release increment in an elastic-perfectly plastic body subjected to prescribed change of the material properties are established. The principles, complementary to each other, can be directly applied to numerical calculations of upper and lower bounds for the energy-release rate problems of fracture mechanics. (11 refs.)

107065 A note on the dynamic stress field near a propagating crack. K.Ravi-Chander (California Inst. of Technol., Pasadena, CA, USA).
Int. J. Solids & Struct. (GB), vol.19, no.9, p.839-41 (1983).
A simple calculation based on the asymptotic crack tip stress distribution is used to determine the stress history due to a propagating crack at points away from the prospective crack line and the results are compared with the experimental measurements made by Kinra and Bowers (see ibid., vol.17, p.175, 1981). Very good qualitative correlation is obtained. (3 refs.)

107066 Dynamic crack-tip field in rate-sensitive solids. K.K.Lo (Chevron Oil Field Res. Co., La Habra, CA, USA).
J. Mech. & Phys. Solids (GB), vol.31, no.4, p.287-305 (1983).
The asymptotic stress and strain fields near the tip of a crack which propagates dynamically in a rate-sensitive solid are obtained under anti-plane shear and plane strain conditions. The problem is formulated within the context of a small-strain theory for a solid whose mechanical behaviour under high strain rates is described by an elastic-viscoplastic constitutive relation. It is shown that, if the stresses are singular at the crack-tip the viscoplastic relation is equivalent asymptotically to an elastic-nonlinear viscous relation. Furthermore, for a certain range of the material parameter which characterizes the rate-sensitivity of the material, the elastic strain-rates near the propagating crack tip are shown to have the same asymptotic radial dependence near the propagating crack-tip as the inelastic strain-rates. This determines the order of the stress singularity uniquely. The governing equations for anti-plane shear and plane strain are then derived. (19 refs.)

107067 A viscoplastic analysis of rapid crack propagation experiments in steel. B.Brickstad (Dept. of Strength of Materials & Solid Mech., Royal Inst. of Technol., Stockholm, Sweden).
J. Mech. & Phys. Solids (GB), vol.31, no.4, p.307-27 (1983).
In order to investigate rapid Mode I crack propagation in steel under large scale yielding conditions a finite element program was developed in which the material is treated as elastic-viscoplastic, based on a theory by P. Perzyna (1966). In this model, rate effects in the plastic deformation process are accounted for. The parameters of the constitutive model were determined from ordinary tensile tests on small specimens by varying the loading rate. It was found that the strain rate can satisfactorily be related to the increase of the inelastic stress-strain relation raised to some power *n*. The FEM-program was applied to a number of crack propagation experiments on highly loaded SEN specimens of a high strength steel. For comparison some experiments were also analysed assuming linear elastic and simulated elastic-plastic material behaviour with no rate sensitivity. It was found that combined plastic and viscous effects are of great importance for an adequate description of rapid crack growth when large scale yielding is at hand. The energy flow to the crack tip region in the viscoplastic case, which is used as a fracture parameter, seems to converge to finite and non-trivial values for sufficiently small values of the element size along the crack tip. (30 refs.)

107068 The dynamic behaviour of slender structure with cross-sectional cracks. P.Gudmundson (Res. Center, Brown, Boveri & Co. Ltd., Baden-Dattwil, Switzerland).
J. Mech. & Phys. Solids (GB), vol.31, no.4, p.329-45 (1983).
A dynamic model for beams with cross-sectional cracks is discussed. It is shown that a crack can be represented by a consistent, static flexibility matrix. Two different methods for the determination of the flexibility matrix are discussed. If the static stress intensity factors are known, the flexibility matrix can be determined from an integration of these stress intensity factors. Alternatively, static finite element calculations can be used for the determination of the flexibility matrix. Both methods are demonstrated. The mathematical model was applied to an edge-cracked cantilevered beam and the eigenfrequencies were determined for different crack lengths and crack positions. These results were compared to experimentally obtained eigenfrequencies. In the experiments, the cracks were modelled by sawing cuts. The theoretical results were, for all crack lengths, in excellent agreement with the experimental data. The dynamic stress intensity factor for a longitudinally vibrating, centrally cracked bar was determined as well. The results compared very well with dynamic finite element calculations. (19 refs.)

107069 Applicability of Weibull analysis for brittle materials. K.Trustrum (School of Math. & Phys. Sci., Univ. of Sussex, Brighton, England), A.de S. Jayatilaka.
J. Mater. Sci. (GB), vol.18, no.9, p.2765-70 (Sept. 1983).
Weibull analysis for the interpretation of strengths of brittle materials was previously justified for a particular flaw size distribution. The present results show that the Weibull distribution provides a close approximation to the distribution of failure stress for all the flaw size distributions considered. However, certain reservations are noted in the interpretation of the Weibull modulus. (4 refs.)

107070 Acoustic emission due to nucleation of a microcrack in the proximity of a macrocrack. J.D.Achenbach, K.-I.Hirashima, K.Ohno (Dept. of Civil Engng., Northwestern Univ., Evanston, IL, USA).
J. Sound & Vib. (GB), vol.89, no.4, p.523-32 (22 Aug. 1983).
Acoustic emission generated by the nucleation of a microcrack in the proximity of a macrocrack is discussed in this paper. On the basis of some simple approximations the acoustic emission from a crack-opening event is directly related to its crack-opening volume as a function of time. It is shown that the nucleation of a microcrack in the immediate vicinity of a macrocrack generates additional crack-opening volumes for both the macrocrack and the microcrack, whose signals tend to be much larger than those that would emanate from a nucleating solitary microcrack. (16 refs.)

107071 Interlaminar stresses at a hole in a composite member subjected to in-plane loading. L.Carlsson (Aeronautical Res. Inst. of Sweden, Bromma, Sweden).
J. Compos. Mater. (USA), vol.17, no.3, p.238-49 (May 1983).
Presents results from a numerical and experimental study of interlaminar stresses and damage in a 28-ply graphite/epoxy composite member with a 6 mm circular hole subjected to in-plane loading. The free span length and width of the specimen investigated were both 24 mm. The numerical results of a three-dimensional finite element analysis show that high interlaminar stress gradients occur at the intersections of the ply interfaces and the free edge. The largest positive value of the interlaminar normal stress, which is about 0.3 times the mean in-plane compressive stress, occurs perpendicularly to the loading direction at the hole boundary between the second and third plies. The experimental part of the study concerned damage detection for structural members subjected to compression fatigue loading. Tetrabromoethane (TBE)-enhanced X-ray techniques combined with sectioning of the samples showed that the damage consisted of transverse matrix cracks in the 0° plies at a tangent to the hole boundary. (17 refs.)

107072 Statistical properties of hybrid composites. I. Recursion analysis. D.G.Harlow (Dept. of Mech. Engng. & Mech., Lehigh Univ., Bethlehem, PA, USA).
Proc. R. Soc. London Ser. A (GB), vol.389, no.1796, p.67-100 (8 Sept. 1983).
An adaptation of the chain-of-bundles probability model for unidirectional intraply hybrid composites of two types of fibres is given. Local load sharing, which is sensitive to the different elastic moduli of the fibres, is assumed for the non-failed fibre segments in each bundle. A sequence of tight upper bounds is developed for the probability distribution of strength for the hybrid. The upper bounds are based upon the occurrence of *k* or more adjacent broken fibre segments in a bundle; this event is necessary but not sufficient for bundle failure. This development allows for a description of a critical crack size k^*, dependent upon the load on the hybrid, which is a characterization of the length of a crack that catastrophically propagates causing bundle failure with virtual certainty. (34 refs.)

107073 Probability of failure of thermoelastic reinforced shells. B.S.Reznikov (Inst. of Hydrodynamics, Acad. of Sci., Novosibirsk, USSR).
Strength Mater. (USA), vol.14, no.10, p.1364-8 (Oct. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.10, p.69-72 (Oct. 1982). [received: Sept. 1983]
A method is suggested for investigating the failure of reinforced shells taking into account the scatter of the mechanical characteristics of the elements of the composite, the structure of the reinforcement, and the parameters of external action. (12 refs.)

107074 The influence of surface dents and grooves on traction in sliding EHD point contacts. C.Cusano (Univ. of Illinois, Urbana, IL, USA), L.D.Wedeven.
ASLE Trans. (USA), vol.26, no.3, p.306-10 (July 1983).
Changes in traction, caused by dents and grooves on a highly polished ball, are investigated as these defects approach and go through sliding elastohydrodynamic (EHD) point contacts. The contacts are formed with the ball loaded against a transparent disk. The ball and thus the topographical features are held stationary at various locations in the vicinity and within the contact while the disk is rotating. It is shown that these topographical features can cause substantial changes in the traction when compared to traction obtained with smooth surfaces. (15 refs.)

107075 Contact stresses in two elastic bodies. Elastic bodies are finite hollow cylinders. Y.Minakuchi (Faculty of Engng., Yamanashi Univ., Kofu, Japan), T.Koizumi, T.Shibuya, K.Yoshimine.
Bull. JSME (Japan), vol.26, no.215, p.716-23 (May 1983).
The contact stress between two different finite hollow cylinders connected by a bolted joint is studied. The three dimensional theory of elasticity is used to analyse the contact stress and the deformation in laminated finite hollow cylinders whose both sides are compressed axisymmetrically under a local uniform pressure. By neglecting shearing stress on the contact surface, an exact solution satisfying the remaining boundary conditions is obtained. Numerical calculations are carried out for various rigidities and thicknesses of the finite hollow cylinders under various loading conditions. In order to examine the results of the theoretical analysis, the contact stress is measured experimentally by using pressure-sensitive pins attached to a finite hollow cylinder. It is confirmed that the theoretical results agree well with the experimental ones except at the vicinity of the loaded area. (14 refs.)

107076 Compression of an elastic cylinder between two rigid planes. Application of the indirect fictitious-boundary integral method to a contact problem. M.Kishida (Faculty of Engng., Hokkaido Univ., Sapporo, Japan), K.Honma.
Bull. JSME (Japan), vol.26, no.215, p.733-8 (May 1983).
Stress analysis of diametrical compression of an elastic circular cylinder between two smooth, flat and parallel rigid planes is performed by the indirect fictitious-boundary integral method. As the contact conditions, a frictionless case and a perfectly adhesive case was treated. Through the present study, an applicability of the present method to the contact problem is confirmed and the deformation process of the surface becomes clear. (9 refs.)

107077 Stress, dilatancy and fabric in granular materials. M.M.Mehrabadi (Dept. of Mech. Engng., Tulane Univ., New Orleans, LA, USA), S.Nemat-Nasser.
Mech. Mater. (Netherlands), vol.2, no.2, p.155-61 (Aug. 1983).
On the basis of a simple micromechanical model, expressions are developed for the overall stress and deformation rate measures in a granular mass which carries the applied loads through contact friction. Various measures of the granular fabric are examined, and explicit connections between a fabric measure and the stress and the deformation rate tensors are obtained. Then, from the balance of energy, a general stress-dilatancy equation is deduced, which includes the effect of fabric. Several other published dilatancy equations are discussed and compared with the new equation. (32 refs.)

107078 Forces on conical-nosed penetrators into targets with constant shear strength. M.J.Forrestal (Sandia Nat. Labs., Albuquerque, NM, USA).
Mech. Mater. (Netherlands), vol.2, no.2, p.173-7 (Aug. 1983).
A closed-form solution for forces on conical-nosed projectiles penetrating geological targets with constant shear strength is developed. The model employs the cylindrical cavity expansion approximation which idealizes the target as thin independent layers normal to the penetration direction and simplifies the analysis to one-dimensional radial wave propagation. Constitutive target description is applicable to concrete and sea ice and consists of a linear hydrostat and a Tresca yield criterion with a tension cutoff. This model has three regions of target response: an elastic region, a region with radial cracks, and a plastic region. Predictions from this theory are compared with other recently developed elastic-plastic models. (6 refs.)

107079 Theoretical experimental study of the ploughing of a rigid-plastic semi-infinite body by a rigid pyramidal indenter. P.Gilormini, E.Felder (Centre de Mise en Forme des Materiaux, Ecole des Mines de Paris, Paris, France).
Wear (Switzerland), vol.88, no.2, p.195-206 (1 July 1983).
Surface ploughing of a rigid-plastic semi-infinite body by a rigid pyramidal indenter is modelled by using a velocity field calculated by minimizing the dissipated power. The theoretical predictions are compared with the results of simulation tests using a model material. Good agreement is found for the tangential force, but the prediction of the flow pattern is less satisfactory. A simplified version of this model gives good results for forces and geometry when compared with tests on a low carbon steel. (6 refs.)

107080 The influence of tangential tractions at the surface on the stresses in contacting bodies during rolling-sliding contact. H.Krause, G.Poll (Dept. of Wear of Materials, Tech. Univ. of Aachen, Aachen, Germany).
Wear (Switzerland), vol.88, no.2, p.221-32 (1 July 1983).
It is shown that there are four parameters which govern the stresses in contacting bodies during rolling-sliding motion: the maximum hertzian pressure p_0; the coefficient of sliding friction, μ; the ratio f_x/μ of the traction coefficient to the coefficient of sliding friction; the direction of the tangential load compared with the direction of rolling, i.e. whether the body is driving or being driven. 46.30R Measurement methods and techniques

(see also 07.10 Mechanical instruments and techniques, 81.70 Materials testing)

107081 An extensometer for axial strain measurement at high temperature. K.Motoie, M.Sakane, J.Schmidt (Dept. of Civil Engng., Northwestern Univ., Evanston, IL, USA).
Mech. Mater. (Netherlands), vol.2, no.2, p.179-82 (Aug. 1983).
Most existing strain measuring instruments, important for the investigation of the mechanical behavior of metals at high temperature, have temperature, strain range, and size limitations. The authors give the design and construction of an extensometer with sufficient dynamic range and good stability over long periods of time, for measuring the longitudinal strain of plane specimens from 0.001 to 0.1 at temperatures up to 800°C. (6 refs.)

107082 Moire interferometry for damage analysis of composites. D.Post (Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
Exp. Tech. (USA), vol.7, no.7, p.17-20 (July 1983).
The author reviews briefly the techniques of moire interferometry as they are practised in his laboratory and demonstrates their potential for revealing U and V displacement fields for analysis of damage in composites. (1 ref.)

107083 Experimental determination of frequencies and shapes of natural oscillations of small bracket plate using holographic interferometry. V.A.Smirnov, K.B.Scherbina.
Izv. VUZ Mashinostr. (USSR), no.7, p.21-4 (1983). In Russian.
The application of holographic interferometry to the study of the oscillations of a small bracket plate and a plate with an additional support is considered. It is noted that the holographic interferometry method offers and exceptionally high degree of accuracy in determining the natural oscillation frequencies. (3 refs.) *L.M.H.*

107084 Computer aided real-time determination of internal forces from tensional measurements in framed structures. II. E.Macha (Inst. fur Maschinenbau, Tech. Hochschule Opole, Opole, Poland).
Mess. & Pruef. (Germany), vol.19, no.6, p.346-51 (June 1983). In German.
The algorithms determining the internal forces and moments across thin-walled framed structures in terms of deformation measurements are considered in a form suitable for treatment by computer. The present article is concerned with the algorithms describing normal forces, bending moments, bimoments and rotational moments of structures with constant cross section. (no refs.) *S.R.*

107085 Ballistic apparatus for examining the behavior of materials under shock loading. S.G.Pasechnik (Inst. of Strength Problems, Acad. of Sci., Kiev, Ukrainian SSR).
Strength Mater. (USA), vol.14, no.8, p.1148-50 (Aug. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.8, p.129-31 (Aug. 1982).
Considers the ballistic calculation for the PK-80 apparatus, which consists of a barrel of diameter 80 mm and length 2465 mm, a pressure chamber of volume 3.77 liter, and a vacuum chamber. THe latter contains the specimen mount and is joined to the barrel with flanges and pins. Air from a cylinder enters the pressure chamber up to a pressure necessary to break a diaphragm, whereupon the latter fails and the striker is accelerated along the barrel; the pressure in the chamber is monitored from a gauge. The striker of mass 230 g accelerated by compressed air at a pressure up to 147.10^4 Pa enables measures to be made at speeds up to 530 m/sec. (9 refs.)

107086 Determination of the stress state of bodies with flaws by the method of holographic photoelasticity. A.A.Ostsemin, S.A.Deniskin, L.L.Sitnikov, S.B.Maksimov, A.A.Zagrebalov.
Strength Mater. (USA), vol.14, no.10, p.1375-80 (Oct. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.10, p.77-81 (Oct. 1982). [received: Sept. 1983]
It is shown experimentally that the absolute path difference bands are independent of the slope of the principal surface elements, which makes it possible to determine the stress of the entire field of the model from two patterns with equally high accuracy. On the basis of an analysis of the errors of the method, a procedure for calibrating the material is suggested which ensures higher accuracy of measurements. For the purpose of improving the effectiveness of using the experimental information, formulae were obtained for plotting the fields of stress intensity σ_i and of the rigidity of the state of stress σ_1/σ_i. 107087 A digital instrumentation package for an improved torsion pendulum. R.W.Nash, A.E.Schwaneke.
Report RI-8774, Bur. Mines, Washington, DC, USA (1983), 9 pp.
Describes the design and operation of a digital instrumentation package for the Bureau of Mines improved torsion pendulum, a scientific instrument that measures the vibration damping of metallic materials. The new automated design eliminates manual analogue-to-digital conversion, reduces the data acquisition time, and increases the precision of the measurements. The digital output can be coupled directly to a microprocessor or computer to produce the final data in real time. (no refs.)

46.60 RHEOLOGY OF FLUIDS AND PASTES

107088 Profile development in continuous drawing of viscoelastic liquids. R.Keunings, M.J.Crochet (Unite de Mecanique Appl., Univ. Catholique de Louvain, Louvain-la-Neuve, Belgium), M.M.Denn.
Ind. & Eng. Chem., Fundam. (USA), vol.22, no.3, p.347-55 (Aug. 1983).
Stress, velocity and diameter profiles are computed for continuous drawing (fiber spinning) of viscoelastic liquids from the fully developed flow in the spinneret to the region of uniform extension where the asymptotic thin filament equations apply. The calculations extend to a capillary recoverable shear of 1.0 for Maxwell and Phan-Thien-Tanner fluids, and to 4.0 for an Oldroyd fluid B; spinline force levels are reached at which significant viscoelastic effects are observed. The thin filament equations generally become valid within two diameters of the spinneret exit, but downstream of the point of maximum extrudate swell. The force at which viscoelastic effects in the spinline become important is adequately estimated from asymptotic solutions to the thin filament equations. (18 refs.)

47.10 GENERAL THEORY

(see also 03.40G Mathematical aspects)

107090 A note on the asymptotic approach to boundary layers of constant thickness. J.H.Merkin (Univ. of Leeds, Leeds, England).
Acta Mech. (Austria), vol.48, no.3-4, p.241-9 (1983).
Using as an example the problem of the unsteady boundary layer on an impulsively started rotating disc, the author shows the necessity of including an outer solution and its consequent matching with the inner solution to derive the asymptotic solution. (18 refs.)

107091 Similarity solutions of the boundary-layer equations for a stretching wall. W.H.H.Banks (School of Math., Univ. of Bristol, Bristol, England).
J. Mec. Theor. & Appl. (France), vol.2, no.3, p.375-92 (1983).
A class of similarity solutions of the boundary-layer equations corresponding to the flow engendered by a stretching surface is presented. The resulting ordinary differential equation which contains a parameter β is discussed in a detailed manner by complementing the previously known special cases with new analytical and numerical solutions. Discussion is also made of certain nonsimilarity solutions. (18 refs.)

107092 Analysis of some low-order finite element schemes for the Navier-Stokes equations. M.J.P.Cullen (Forecasting Res. Branch, Meteorological Office, Bracknell, England).
J. Comput. Phys. (USA), vol.51, no.2, p.273-90 (Aug. 1983).
Various low-order finite element schemes for the Navier-Stokes equations are analysed, including the commonly used bilinear velocity, piecewise constant pressure element, and the algorithms based on the finite element analogue of the MAC stencil of Dicano and Piva (1980). By performing a truncation error analysis using a variety of different assumptions about how the nodal parameters represent the data, it is shown how a more complete picture of the behaviour of the algorithms can be obtained. In particular, differences in performance on coarse grids using algorithms which have the same asymptotic covergence rate can be explained. (20 refs.)

107093 Experiments with some low-order finite elements schemes for the Navier-Stokes equations. M.J.P.Cullen (Forecasting Res. Branch, Meteorological Office, Bracknell, England).
J. Comput. Phys. (USA), vol.51, no.2, p.291-312 (Aug. 1983).
It is shown how a consistent finite element approximation to the Navier-Stokes equations can be constructed on a general grid using an arrangement equivalent to the MAC stencil. It is known that the standard Galerkin construction does not give a consistent result unless at least quadratic velocities are used in this type of element. However, the use of either a finite difference approximation to the pressure gradient term or a Galerkin scheme equivalent to a vorticity method appears to give a consistent scheme. Both alternatives are tested, and the vorticity method is shown to be superior. (18 refs.)

107094 Fingers in a Hele-Shaw cell with surface tension. J.-M.Vanden-Broeck (Dept. of Maths., Univ. of Wisconsin, Madison, WI, USA).
Phys. Fluids (USA), vol.26, no.8, p.2033-4 (Aug. 1983).
McLean and Saffman's (1981) model for the fingering in a Hele-Shaw cell is solved numerically. The results suggest that a countably infinite number of solutions exist for nonzero surface tension. This set of solutions contains the solution previously obtained by McLean and Saffman. (3 refs.)

107095 The approach of a sphere to an interface. M.E.O'Neill (Dept. of Maths., Univ. Coll. London, London, England), K.B.Ranger.
Phys. Fluids (USA), vol.26, no.8, p.2035-42 (Aug. 1983).
A solution to the problem posed when a rigid sphere normally approaches an interface between immiscible viscous fluids is presented when the deformation of the interface is small compared with the sphere radius or its minimum clearance from the undistorted interface. The complete boundary conditions at the interface of continuity of velocity and tangential stress together with discontinuity of normal stress by the surface tension times the mean curvature are applied in the first-order analysis of a perturbation scheme in which the interface has small distortion from planar. This results in a finite force on the sphere being predicted as the sphere approaches the interface. (6 refs.)

107096 New representation of Navier-Stokes equations governing self-similar homogeneous turbulence. C.Foias (Indiana Univ., Bloomington, IN, USA), O.P.Manley, R.Temam.
Phys. Rev. Lett. (USA), vol.51, no.8, p.617-20 (22 Aug. 1983).
A new form of the Navier-Stokes equation resulting from a change of variables is presented. The new form has several advantages: It yields a new asymptotic behavior of the flow for long times and vanishingly small viscosity. In addition an interpretation of the new equation in terms of a simple random walk yields immediately not only the Kolmogorov 2/3-power law but also an intermittency exponent well within the experimental uncertainty. (10 refs.)

107097 Equilibrium fluctuations in fluid layers: effects of elastic solid boundaries. D.Gutkowicz-Krusin (Corporate Res.-Sci. Labs., Exxon Res. & Engng. Co., Linden, NJ, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1602-11 (Sept. 1983).
The hydrodynamic theory of the dynamics of equilibrium fluctuations in one-component fluid layers confined by two identical elastic solid boundaries is presented. The dynamic structure factor for a fluid layer and the interfacial modes are analyzed under assumptions of continuity of stresses (no interfacial stress) and velocities ('stick' boundary condition) across the fluid-solid interfaces. There are four interfacial modes in such a system with dispersion relations which depend on the component of the wave vector parallel to the interfaces, $k_\parallel$. In the limit of $\bar{\rho}/\rho_s \rightarrow 0$, where $\bar{\rho}$ and ρ_s are the mean densities of the fluid and solid, respectively, two of these modes are just the well-known Rayleigh waves and the remaining two are the interfacial fluid modes found previously in the case of rigid solid walls [see D. Gutkowicz-Krusin and I. Procaccia, Phys. Res. Lett. 48, 417 (1982); Phys. Rev. A 27, 2585 (1983)]. For finite small values of $\bar{\rho}/\rho_s$ the attenuation of the interfacial fluid modes is due to dissipative interfacial transport and varies as ${k_\parallel}^{3/2}\bar{\rho}/\rho_s$, provided that $c<c_t$, where c is the speed of sound in the fluid and c_t is the transverse sound speed in the solid. If, however, $c>c_t$, the energy of the interfacial fluid mode is radiated into the solid and the resulting attenuation along the interface varies as $k_\parallel(\bar{\rho}/\rho_s)^2$, for small $k_\parallel$. Since the speed of the interfacial fluid modes is less than c, the corresponding peaks in the dynamic structure factor are better separated from the unbounded fluid Brillouin peaks and thus easier to observe experimentally than would have been the case with rigid solid walls. (5 refs.)

47.15 LAMINAR FLOWS

107098 An experimental study of gas exchange in laminar oscillatory flow. C.H.Joshi, R.D.Kamm (MIT, Cambridge, MA, USA), J.M.Drazen, A.S.Slutsky.
J. Fluid Mech. (GB), vol.133, p.245-54 (Aug. 1983).
Experiments were conducted to determine the effective diffusivity for axial transport through a tube of circular cross-section of a contaminant gas in oscillatory flow. Results were compared with the theoretical predictions of Watson (1983) and found to be in excellent agreement. The experiments differ from the theoretical situation in that the oscillations are superimposed upon a steady flow due to a constant infusion of tracer gas, and a buoyancy-induced flow associated with spatial variations in gas density. The influence of both artifacts is found to be negligible. (14 refs.)

47.20 HYDRODYNAMIC STABILITY

107099 Breakdown of boundary layers: (i) on moving surfaces; (ii) in semi-similar unsteady flow; (iii) in fully unsteady flow. J.W.Elliott, F.T.Smith (Math. Dept., Imperial Coll., London, England), S.J.Cowley.
Geophys. & Astrophys. Fluid Dyn. (GB), vol.25, no.1-2, p.77-138 (1983).
The breakdown and separation or reattachment of boundary layers adjoining a mainstream are studied in the three related situations (i)-(iii) of the title. (42 refs.)

107100 The flow of a second grade fluid. P.N.Kaloni, A.M.Siddiqui (Dept. of Maths., Univ. of Windsor, Windsor, Ontario, Canada).
Int. J. Eng. Sci. (GB), vol.21, no.10, p.1157-69 (1983).
Discusses a method for studying plane steady flows of a second grade fluid. Basic equations are recast in a new curvilinear coordinate system, by employing some results from differential geometry, and the partial differential equations are derived for the coefficients E, F and G of the first fundamental form of the metric, which are taken as unknown functions. By placing certain conditions on these coefficients, a priori, flows are determined which have such a property. Some illustrations in detail are given which reflect the use of this method. (11 refs.)

107101 Dynamics of the phase variable in the Taylor vortex system. P.Tabeling (Ecole Superieure d'Electricite, Univ. Paris-VI et Paris-XI, Gif-sur-Yvette, France).
J. Phys. Lett. (France), vol.44, no.16, p.L665-72 (15 Aug. 1983).
Using a multiple scale method for the Taylor-Couette instability, the author obtains, in a suitable moving frame, a diffusion equation for the phase variable of the vortex system. The transversal diffusion coefficient $D\perp$ is found to be positive. The phase diffusion equation restricted to the one-dimensional case seems to be relevant for interpreting Snyder's experiments (1969) on the relaxation of vortex systems in the Taylor-Couette flow. (9 refs.)

107102 Time evolution of density perturbations in accelerating stratified fluids. K.O.Mikaelian (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1637-46 (Sept. 1983).
The author considers N superimposed fluids, having arbitrary initial perturbations at their $N-1$ interfaces, undergoing a Rayleigh-Taylor instability with constant acceleration. The time evolution of these perturbations is described by a sum over normal modes and in general is a combination of oscillation and exponential rise. The author derives the equation governing their growth, discusses the case $N=3$ analytically, and gives two numerical examples and plots the time evolution of the perturbations at the four interfaces of five superimposed fluids. Examples illustrate how the evolution depends on the density profile, on the wavelength of the perturbations, and on the initial conditions. (14 refs.)

47.25 TURBULENT FLOWS, CONVECTION, AND HEAT TRANSFER

107103 Multiple scale concept in turbulence modelling. I. Multiple scale model for turbulence kinetic energy and mean square of passive scalar fluctuations. R.Schiestel (Inst. de Mecanique Statistique de la Turbulence, Marseille, France).
J. Mec. Theor. & Appl. (France), vol.2, no.3, p.417-49 (1983). In French.
Multiple scale modeling is studied on the basis of spectral dynamic equations in homogeneous anisotropic turbulence. Integration between partitioning wavelengths gives the equations for evolution of partial energies, the meaning of the different terms is thus clarified. Turbulent scale equations are no longer obtained from modeling the dissipation rate equation of turbulence kinetic energy but arise directly from the choice of partitioning wavelengths which are connected to characteristic scales. The same method is then applied to passive scalar transfer (such as temperature). Interpretation in physical space is also given. (29 refs.)

107104 Transport near a vertical ice surface melting in water of various salinity levels. B.Sammakia, B.Gebhart (Dept. of Mech. Engng. & Appl. Mech., Univ. of Pennsylvania, Philadelphia, PA, USA).
Int. J. Heat & Mass Transfer (GB), vol.26, no.10, p.1439-52 (Oct. 1983).
The results of an experimental investigation of the buoyancy driven flow adjacent to a vertical ice surface melting in saline water are presented. Several ambient water salinities, s_∞, are studied, namely 14 per mille, 17 per mille, 22 per mille, 30 per mille and 35 per mille. For each salinity level, several ambient water temperatures, t_∞, are investigated, ranging from $t_\infty=-1.75°C$ when $s_\infty=35$ per mille to $t_\infty=17°C$ when $s_\infty=17$ per mille. Time exposure photographs of the flow field show that several distinctively different regimes of flow occur, depending on both the ambient water salinity level and temperature. All of the salinities considered in the present study, the flow is observed to be laminar at low ambient water temperatures. This laminar flow is either upward, at the low salinity levels, or bi-directional at the higher salinities. At intermediate ambient water temperatures the flow is observed to be bi-directional and laminar over the lower portion of the ice surface, and upward and turbulent over the top portion of the ice surface. As the ambient water temperature is further increased the flow is seen to split, with a downward moving turbulent layer over the lower portion of the ice surface, and an upward moving layer over the top portion. The complicated nature of this type of flow is due to the interaction of two buoyancy force components, namely that due to salinity gradients and that due to the thermal gradients. These forces are aiding or opposing, depending on the ambient water salinity level and temperature. Also, each of these forces exerts itself across a different thickness of the total boundary region. Velocity profiles, measured from the time exposure photographs, are presented and shown to be in good agreement with the analytical results of Carey and Gebhart [1, J. Fluid Mech., 107, 37-55, 1981]. Measured solid-liquid interface temperatures and inferred interface salinities are also presented for the different salinity levels and ambient water temperatures. (9 refs.)

107105 Kinematic, integral, and thermal characteristics of turbulent stream of gaseous suspension under nonsteady thermal conditions. A.V.Fafurin, K.R.Shangareev (S.M. Kirov Kazan Chemicotechnol. Inst., Kazan, USSR).
J. Eng. Phys. (USA), vol.43, no.5, p.1220-4 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.5, p.748-53 (Nov. 1982). [received: Sept. 1983]
The effect of two-phasality and of thermal nonsteadiness on the characteristics of a stream of a gaseous suspension is analyzed on the basis of the solution to integral equations of energy and momentum. (9 refs.)

107106 The evolution of large-horizontal-scale disturbances in marginally stable, inviscid, shear flows. I. Derivation of the amplitude evolution equations. F.J.Hickernell (Dept. of Math., Univ. of Southern California, University Park, Los Angeles, CA, USA).
Stud. Appl. Math. (USA), vol.69, no.1, p.1-21 (Aug. 1983).
Two inviscid, stratified, shear flow models are studied. The amplitude evolution equations for large-horizontal-scale disturbances are derived. Particular attention is given to the case where the flows are marginally stable. In this case the amplitude evolution equations are second order in time. A typical example is the Boussinesq equation. (28 refs.)

107107 The evolution of large-horizontal-scale disturbances in marginally stable, inviscid, shear flows. II. Solutions of the Boussinesq equation. F.J.Hickernell (Dept. of Math., Univ. of Southern California, University Park, Los Angeles, CA, USA).
Stud. Appl. Math. (USA), vol.69, no.1, p.23-49 (Aug. 1983).
For pt.I see ibid., vol.LXIX, no.1, p.5135-83005 (1983). In part I the Boussinesq equation was found to describe large-horizontal-scale disturbances in certain marginally stable flows. In this paper the properties of the solutions of this equation are explored. Solutions that are bounded for all time and those that blow up in finite time are observed analytically and numerically. Sufficient conditions for both boundedness and blowup are given. (19 refs.)

47.25C Isotropic turbulence

107108 Empirical equations for the structure of isotropic turbulence. Y.Sato, K.Yamamoto, T.Mizushina (Dept. of Chem. Engng., Yokohama Nat. Univ., Yokohama, Japan).
Bull. Fac. Eng. Yokohama Natl. Univ. (Japan), vol.32, p.45-67 (March 1983).
For the double velocity-correlation function $f(r,t)$ in the Karman-Howarth (K-H) equation representing the dynamic behaviour of homogeneous isotropic turbulence, the empirical equation is first formulated using two parameters: the RMS fluctuation velocity u, and the turbulent Reynolds number $R_\lambda=u'\lambda/\sqrt{2\nu}$ (λ is the longitudinal microscale and ν the kinematic viscosity), in the form of $f(\psi,R_\lambda)$, where $\psi=r/\lambda$. The empirical equation is obtained by rearranging the data measured in a nearly isotropic field behind a grid with reference to other pertinent investigations which have been developed theoretically and experimentally. The validity of this empirical equation is confirmed by comparison between the calculated results and experimental data over a wide range of $R_\lambda(10\gtrsim R_\lambda\gtrsim 10^4)$. The triple correlation function $k(r,t)$ is computed numerically based on K-H equation with the known variable u'^2f, and

consequently can be expressed in the form of $k(\psi,R_\lambda,I_\lambda)$, where I_λ is introduced to describe the decay state. The calculated results are consistent with the present data of direct measurements of $k(r)$ and some relevant measurements reported previously for $10 \gtrsim R_\lambda \gtrsim 10^4$. The application of these empirical equations to grid turbulence is described. (52 refs.)

107109 The turbulent recirculating flow field in a coreless induction furnace, a comparison of theoretical predictions with measurements. N.El-Kaddah, J.Szekely (Dept. of Materials Sci. & Engng., MIT, Cambridge, MA, USA).
J. Fluid Mech. (GB), vol.133, p.37-46 (Aug. 1983).
A mathematical representation has been developed for the electromagnetic force field and the fluid-flow field in a coreless induction furnace. The fluid flow field was represented by writing the axisymmetric turbulent Navier-Stokes equations, containing the electromagnetic body-force term. The electromagnetic body force field was calculated by using a technique of mutual inductances. The k-ϵ model was employed for evaluating the turbulent viscosity, and the resultant differential equations were solved numerically. The theoretically predicted velocity fields were in reasonably good agreement with the experimental measurements reported by Hunt & Moore (1982); furthermore, the agreement regarding the turbulence intensities was essentially quantitative. These results indicate the k-ϵ model does provide a good engineering representation of the turbulent recirculating flows occurring in induction furnaces. At this stage it is not clear whether the discrepancies between measurements and the predictions, which were not very great in any case, are attributable either to the model or to the measurement techniques employed. (17 refs.)

107110 A digital technique for the simultaneous measurement of streamwise and lateral velocities in turbulent flows. J.G.Kawall, M.Shokr, J.F.Keffer (Dept. of Mech. Engng., Univ. of Toronto, Canada).
J. Fluid Mech. (GB), vol.133, p.83-112 (Aug. 1983).
A novel, digital, hot-wire anemometer technique for the simultaneous measurement of the instantaneous streamwise and lateral velocity fields in high-intensity turbulent flows is discussed. It involves the use of a three-wire probe comprising two 45° slanted hot wires and a normal hot wire. A comprehensive and systematic examination of several factors that can affect the fidelity of the streamwise and lateral velocity waveforms is developed to assess the performance of the new technique as well as hot-wire systems generally. These factors are: (i) rectification which stems from the inherent insensitivity of hot wires to the direction of the instantaneous (total) velocity vector in a turbulent flow; (ii) spanwise velocity fluctuations; (iii) axial cooling of hot wires; (iv) unpredictable variations in one of four hot-wire calibration parameters; (v) random hot-wire calibration errors; (vi) spanwise separation of the hot wires. Relevant hot-wire anemometer-response equations relating instantaneous anemometer output voltages to instantaneous flow velocities were established on the basis of extensive voltage-velocity calibration data pertaining to hot wires orientated with respect to the calibration flow velocity at various yaw and pitch angles ranging from 0° to 90°. (16 refs.)

107111 The growth of a grid-generated turbulent mixed layer in a two-fluid system. H.J.S.Fernando, R.R.Long (Dept. of Earth & Planetary Sci., Johns Hopkins Univ., Baltimore, MD, USA).
J. Fluid Mech. (GB), vol.133, p.377-95 (Aug. 1983).
Describes a laboratory experiment designed to compare measurements with published theoretical ideas of the mixed-layer growth of a two-layer system in which the turbulence is induced by an oscillating grid. Experimental results show excellent agreement with an earlier theory by Long (1978), in which the mixed-layer depth D_* measured from a virtual origin is given by $D_* \sim V_0^{-7/11} K^{9/11} t^{2/11}$, where K is action, t is time and V_0 is a characteristic velocity of the problem. The experiments also verify Long's theoretical entrainment relation $E=\alpha_2 Ri^{-7/4}$, where E is the entrainment coefficient and $Ri=D_*^3 \Delta b/K^2$, and Δb is the buoyancy difference between the two layers. The interfacial-layer thickness was observed to be proportional to the depth of the mixed layer, as also predicted by Long. After a certain depth, the entrainment law tends to deviate from Long's theory. The deviation may be due to wall effects. (47 refs.)

107112 Effect of phase velocity difference on the turbulent structure of a jet carrying heavy impurities. T.A.Girshovich, V.A.Leonov (Sergo Ordzhonikidze Moscow Aviation Inst., Moscow, USSR).
J. Eng. Phys. (USA), vol.43, no.4, p.1062-8 (Oct. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.4, p.541-8 (Oct. 1982). [received: Sept. 1983]
A model is proposed to calculate the effect of a difference in the mean velocities of particles and a gas on the turbulent structure of a jet carrying heavy impurities. The model considers the effect of all particles in a mole of the gas on the velocity of the mole at the end of its 'life'. (5 refs.)

107113 Kinematics of velocity and vorticity correlations in turbulent flow. P.S.Bernard (Dept. of Mech. Engng., Univ. of Maryland, College Park, MD, USA).
Phys. Fluids (USA), vol.26, no.8, p.2080-7 (Aug. 1983).
The kinematic problem of calculating second-order velocity moments from given values of the vorticity covariance is examined. Integral representation formulas for second-order velocity moments in terms of the two-point vorticity correlation tensor are derived. The special relationships existing between velocity moments in isotropic turbulence are expressed in terms of the integral formulas yielding several kinematic constraints on the two-point vorticity correlation tensor in isotropic turbulence. Numerical evaluation of these constraints suggests that a Gaussian curve may be the only form of the longitudinal velocity correlation coefficient which is consistent with the requirement of isotropy. It is shown that if this is the case, then a family of exact solutions to the decay of isotropic turbulence may be obtained which contains Batchelor's final period solution as a special case. In addition, the computed results suggest a method of approximating the integral representation formulas in general turbulent shear flows. (23 refs.)

107114 Variational approach to the closure problem of turbulence theory. J.Qian (Inst. of Mech., Acad. of Sci., Beijing, China).
Phys. Fluids (USA), vol.26, no.8, p.2098-104 (Aug. 1983).
A new method is proposed to solve the closure problem of turbulence theory and to drive the Kolmogorov law in an Eulerian framework. Instead of using complex Fourier components of velocity field as modal parameters, a complete set of independent real parameters and dynamic equations are worked out to describe the dynamic states of a turbulence. Classical statistical mechanics is used to study the statistical behavior of the turbulence. An approximate stationary solution of the Liouville equation is obtained by a perturbation method based on a Langevin-Fokker-Planck (LFP) model. The dynamic damping coefficient η of the LFP model is treated as an optimum control parameter to minimize the error of the perturbation solution; this leads to a convergent integral equation for η to replace the divergent response equation of Kraichnan's direct-interaction (DI) approximation, thereby solving the closure problem without appealing to a Lagrangian formulation. The Kolmogorov constant Ko is evaluated numerically, obtaining Ko=1.2, which is compatible with the experimental data given by Gibson and Schwartz. (24 refs.)

47.25F Boundary layer and shear turbulence

107115 Study of binary turbulent boundary layer on permeable surface in region of screen. L.L.Kalishevskii, L.A.Kuznetsov, G.P.Nikitushkina, V.Ya.Strel'tsov.
Izv. VUZ Mashinostr. (USSR), no.7, p.48-52 (1983). In Russian.
The experimental results of a study of the influence of the structural design of the supply unit for the components of the screen in a turbulent boundary layer on a permeable surface with a homogeneous intake are presented. Recommendations are made concerning the selection of the most suitable design for the supply unit in order to ensure the maximum lengths at which the screen will operate efficiently. (4 refs.) *L.M.H.*

107116 Computation of turbulent flow over a moving wavy boundary. J.W.McLean (TRW Space & Technol. Group, Redondo Beach, CA, USA).
Phys. Fluids (USA), vol.26, no.8, p.2065-73 (Aug. 1983).
Numerical solutions via Newton's method of the Reynolds-averaged Navier-Stokes equations for steady flow over a two-dimensional wavy surface indicate that by using a simple algebraic eddy-viscosity model the distribution of wall pressure and shear stresses and the corresponding drag coefficients can be predicted. Computations are compared with experimental results over rigid wavy surfaces and moving flexible boundaries. For small-amplitude wavy surfaces, computed values of the wall stresses agree well with the experimental measurements. For larger-amplitude waves, regions of reverse flow in the trough of the wave are predicted. (25 refs.)

107117 On the structure of wall-bounded turbulent flows. J.Kim (NASA, Ames Res. Center, Moffett Field, CA, USA).
Phys. Fluids (USA), vol.26, no.8, p.2088-97 (Aug. 1983).
The variable-interval time-averaging (VITA) technique developed by Blackwelder and Kaplan [J. Fluid Mech. 76, 89 (1976)] is applied to data obtained from large-eddy simulation of turbulent channel flow in an investigation of the organized structures associated with the bursting phenomenon in the near-wall region. Conditionally average velocities, shear stress, pressure, and vorticity are discussed in conjunction with the bursting phenomenon detected by the VITA technique. The conditionally averaged pressure reveals that the ejection process is associated with a localized adverse pressure gradient. In the plane perpendicular to the flow direction, the conditionally averaged vorticity field indicates that a pair of counterrotating streamwise vortices is being lifted through the ejection process. (18 refs.)

107118 Spectral relationships between velocity and temperature fluctuations in turbulent shear flows. L.Fulachier (Inst. de Mecanique Statistique de la Turbulence, Marseille, France), R.A.Antonia.
Phys. Fluids (USA), vol.26, no.8, p.2105-8 (Aug. 1983).
The frequency dependence of a turbulent Prandtl number, defined using the Reynolds shear stress and normal heat flux co-spectra, in various turbulent shear flows accentuates the inadequacy of the Reynolds analogy from a spectral point of view. For the same flows, the analogy between spectral distributions of the kinetic energy and the temperature variance is validated over a significant frequency domain. This analogy suggests a spectral parameter which is very close to unity in this frequency range for all the flows considered. (17 refs.)

107119 Spectral analysis of turbulent intermittency functions. T.Koso, Y.Senoo, H.Ohashi.
Rep. Res. Inst. Ind. Sci. Kyushu Univ. (Japan), no.74, p.149-57 (1983). In Japanese.
Walsh spectral analysis of turbulent intermittency functions is introduced and proved to be useful in studying large-scale organized motions in free turbulent shear layers. The analysis is applied to a three-dimensional turbulent wall jet. (7 refs.)

47.25J Turbulent diffusion

107120 How rapidly is a passive scalar mixed within closed streamlines?. P.B.Rhines (Woods Hole Oceanographic Instn., Woods Hole, MA, USA), W.R.Young.
J. Fluid Mech. (GB), vol.133, p.133-45 (Aug. 1983).
The homogenization of a passive 'tracer' in a flow with closed mean streamlines occurs in two stages: first, a rapid phase dominated by shear-augmented diffusion over a time $\approx P^{1/3}(L/U)$, where the Peclet number $P=LU/\kappa$ (L,U and κ are lengthscale, velocity scale and diffusivity), in which initial values of

the tracer are replaced by their (generalized) average about a streamline; second, a slow phase requiring the full diffusion time $\approx L^2/\kappa$. The diffusion problem for the second phase, where tracer isopleths are held to streamlines by shear diffusion, involves a generalized diffusivity which is proportional to κ, but exceeds it if the streamlines are not circular. Expressions are also given for flow fields that are oscillatory rather than steady. (23 refs.)

107121 Stationary and oscillatory instabilities for mixture subjected to Soret effect in vertical cylinder with axial temperature gradient. D.Henry (Univ. de Lyon I, Villeurbanne, France), B.Roux.
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.145-52
The authors consider a binary mixture subjected to Soret effect in a confined vertical cylinder, with a constant temperature gradient imposed along its axis. An accurate Galerkin method is used to compute marginal stability for stationary and oscillatory perturbations of axi-symmetric and asymmetric modes. Some 'universal' new results are given in terms of the thermal diffusion parameter ψ, specially for an aspect ratio of 1/6, corresponding to an apparatus to be used in microgravity environment to measure the Soret coefficient of a AgI-KI mixture. 47.25M Noise (turbulence generated)

107122 Separated flow noise of a flat plate at large attack angles. Y.Maruta (Res. Lab., Ebara Corp., Fujisawa-shi, Kanagawa, Japan), S.Kotake.
J. Sound & Vib. (GB), vol.89, no.3, p.335-57 (8 Aug. 1983).
Flow noise associated with separated flow of a flat plate with large attack angles was studied experimentally to obtain its acoustic characteristics and to understand its generation mechanism. The acoustic features show that the separated flow noise could be attributed to acoustic dipole sources associated with the wall-pressure fluctuations on the plate surface. The time derivative of the fluctuating wall-surface pressure is highly correlated with the associated acoustic pressure. The noise intensity source strength is proportional to the mean-square time derivative of the fluctuating surface pressure and its correlation area, being proportional to the sixth power of the oncoming flow velocity and distributed uniformly over the plate surfaces. The associated acoustic intensity is well predicted by these noise source strength distributions. (6 refs.)

47.25Q Convection and heat transfer

(see also 44.25 Convective and constrained heat transfer)

107123 An experimental investigation of convection patterns in flow past an obstacle. M.S.Ouraishi, T.Z.Fahidy, M.S.E.Abdo (Dept. of Chem. Engng., Univ. of Waterloo, Waterloo, Ontario, Canada).
Chem. Eng. Sci. (GB), vol.38, no.8, p.1271-9 (1983).
The propagation of liquid flow in a cylindrical tube past solid obstacles of various shapes and sizes has been studied at Reynolds numbers up to about 6600 via a direct electrochemical flow visualization technique, where the obstacles were connected as cathodes and the colour change of a suitable analytical indicator was employed for the marking of convecting flow. Typical propagation patterns are shown by photographs and the effect of the obstacle on local velocities at the core of tube is analyzed. (14 refs.)

107124 Methods of solving certain inverse problems of heat and mass transfer. A.A.Aleksashenko.
Power Eng. (J. Acad. Sci. USSR) (USA), vol.20, no.2, p.148-53 (1982). Translation of: *Izv. Akad. Nauk SSSR Energ. & Transp.*, vol.20, no.2, p.161-6 (1982).
Methods are given for the solution of certain inverse problems of heat and mass transfer. Calculation formulas are obtained on the basis of a method of direct integration, together with self-similar solutions for a semi-bounded region. Sample calculations are shown. (10 refs.)

107125 Intensification of heat exchange in banks of twisted tubes in transverse flows. L:A.Ashmantas, Yu.V.Vilemas, B.V.Dzyubenko, G.A.Dreitser, N.V.Paramonov, V.Yu.Survila.
Power Eng. (J. Acad. Sci. USSR) (USA), vol.20, no.6, p.93-100 (1982). Translation of: *Izv. Akad. Nauk SSSR Energ. & Transp.*, vol.20, no.6, p.120-7 (1982).
Results are reported for an experimental investigation into heat exchange and hydraulic resistance for a bank of tightly packed twisted tubes of oval profile in a transverse flow. Criterial dependences are proposed for calculating the heat-transfer coefficients and the hydraulic resistance. It has been found that in banks of twisted tubes in a transverse flow the nonuniformity of the distribution of the heat-transfer coefficient over the perimeter of a tube is less by a factor of 2-3 than for a smooth-tube bank. The effectiveness of a heat-exchange unit with transverse flow past twisted tubes is evaluated. it is shown that for a certain mutual orientation of the twisted tubes in the bank there may be a 25% reduction in the volume of heat-exchange units as compared with round tubes. (7 refs.)

107126 Heat transfer for elastico-viscous flow between two rotating porous discs. P.R.Sharma, P.D.Verma (Dept. of Math., Univ. of Rajasthan, Jaipur, India).
Def. Sci. J. (India), vol.33, no.2, p.137-46 (April 1983). [received: Aug. 1983]
The problem of temperature distribution and heat transfer for elastico-viscous fluid flow between two rotating porous discs is studied. The equations of motion and energy are solved by a regular perturbation method for small Reynolds number. The effects of the elasticity of the fluid, suction/injection parameter, rotation parameter, Prandtl number and Eckert number on Nusselt numbers at the two discs have been discussed numerically and compared with Newtonian fluid case. (8 refs.)

107127 Long rolls generated by natural convection in an inclined, rectangular enclosure. H.Ozoe, K.Fujii (Okayama Univ., Tsushima, Okayama, Japan), N.Lior, S.W.Churchill.
Int. J. Heat & Mass Transfer (GB), vol.26, no.10, p.1427-38 (Oct. 1983).
The three-dimensional velocity and temperature fields, are in turn the average Nusselt number and representative streaklines were computed by a finite-difference method for a cellular element with a length-to-height ratio of 7 and several postulated width-to-height ratios near unity in a rectangular enclosure heated from below, perfectly insulated on the lateral surfaces, and inclined about the long dimension. Calculations were carried out for $Ra=4000$, $Pr=10$ and a single grid spacing (non-uniform in the long dimension) for cells with dragless lateral boundaries and for those with one dragless and one rigid. Computations such as these have previously been utilized to develop a simple, theoretically based method for the prediction of Nu in horizontal enclosures of arbitrary aspect ratios. Further calculations are necessary to support such a method of prediction for inclined enclosures and to define its limits of applicability. (24 refs.)

107128 Evaporative convection in minute drops on a plate with temperature gradient. N.Zhang, Wen-Jei Yang (Dept. of Mech. Engng. & Applied Mech., Univ. of Michigan, Ann Arbor, MI, USA).
Int. J. Heat & Mass Transfer (GB), vol.26, no.10, p.1479-88 (Oct. 1983).
Thermal convection in a minute drop evaporating on a plate surface is visualized through two methods: solid suspension and laser shadow graphs. The plate is partially heated to create a temperature field on the test so that the Marangoni effect may be induced on the drop surface. Through altering plate inclination, the evaporating drop may stay at rest at the same spot or move on the plate. The observation of flow patterns in a stationary drop reveals that the presence of both surface tension and buoyancy forces lead to four distinct flow regimes in the drop with the buoyancy-driven convection on the warm side and the surface tension driven instability on the cold side. The effects of drop motion, liquid properties and air-liquid interfacial geometry on both the interfacial and internal flow structures are determined and the consequences of the evaporation rate are discussed. (6 refs.)

107129 Mechanism for transition to turbulence in buoyant plume flow. S.Kimura, A.Bejan (Dept. of Mech. Engng., Univ. of Colorado, Boulder, CO, USA).
Int. J. Heat & Mass Transfer (GB), vol.26, no.10, p.1515-32 (Oct. 1983).
Reports a theoretical and experimental study of the fundamental mechanism responsible for transition in natural convection plume flow. Theoretically, it is argued that the transition occurs when the time of viscous penetration normal to the plane becomes comparable with the minimum time period with which the plume can fluctuate as an unstable inviscid stream. It is also argued that at transition the plume wavelength must always scale with the local plume diameter. The experimental part of the study focused on transition in the axisymmetric air plume above a point heat source. Smoke visualization of the plume shape at transition led to extensive observations that support strongly the transition mechanism proposed theoretically. The transitional plume is seen to meander in a plane (two-dimensionally) and with a wavelength which scales with the plume diameter. If excited externally by many such wavelengths, the plume has the property to select the natural wavelength proposed theoretically. The equivalence between the present transition mechanism and the transition predicted by the buckling theory is discussed. (21 refs.)

107130 Local heat transfer rates from two adjacent spheres in turbulent flow. D.C.T.Pei, G.Hayward (Univ. of Waterloo, Waterloo, Ontario, Canada).
Int. J. Heat & Mass Transfer (GB), vol.26, no.10, p.1547-56 (Oct. 1983).
The interactions between a pair of spheres in a crossflow orientation was studied in a vertical wind tunnel. The flow Reynolds number was approximately 10^4 with a turbulence intensity of 1.1%. The spacing between the sphere centres was varied from 1.04 to 2 diameters. Both the local surface pressures and heat transfer coefficients were measured. The measurement technique allowed the fluctuating component of the heat transfer to be measured as well as the time averaged values. The present results indicate the formation of a jet-like flow between the spheres. At close spacing, this jet remained attached to one of the spheres giving rise to crossflow forces. At very close spacings, the increased shear stress in the region between the spheres resulted in a decrease in the strength of the jet and the magnitude of the crossflow forces. (23 refs.)

107131 Second-order boundary-layer flow past sharp cones. M.N.Mathur (Inst. fur Experimentelle Stromungsmechanik, Deutsche Forschungs-und Versuchsantstalt fur Luft-und Raumfahrt eV, Gottingen, Germany).
Int. J. Heat & Mass Transfer (GB), vol.26, no.10, p.1557-70 (Oct. 1983).
Second-order boundary-layer effects of displacement thickness, transverse curvature, wall slip and temperature jump have been investigated in detail for flow past sharp cones of 5°, 10° and 15° semi-vertex angles. Similar solutions of the non-dimensional first- and second-order boundary-layer equations exist and numerical solutions of the resulting systems of ordinary-differential equations have been obtained using the finite-difference technique with variable step size. The second-order effects have been computed for different values of Mach number, wall temperature, and injection parameter. Some of the first-order results for wall heat transfer have been compared with the available experimental results at DFVLR. (26 refs.)

107132 Free convective viscous flow past a hot vertical porous plate with periodic temperature. B.P.Acharya, S.Padhy (Dept. of Maths., Utkal Univ., Bhubaneswar, India).
Indian J. Pure & Appl. Math., vol.14, no.7, p.838-49 (July 1983).
An analysis of a free convective flow of a viscous liquid past a hot vertical porous wall is presented under the assumptions that the suction velocity is constant and normal to the wall and the wall temperature is spanwise cosinusoidal. Approximate solutions of the equations of motion and energy have been obtained by the method of regular perturbation. The effects of the different flow parameters on the functions affecting the mean velocity, temperature, skin-friction and rate of heat transfer have been presented. (4 refs.)

107133 A numerical study of mixed convection flow in enclosures. Y.Jaluria (Mech. & Aerospace Engng., Rutgers Univ., New Brunswick, NJ, USA), S.K.Gupta.
Int. J. Energy Res. (GB), vol.7, no.3, p.201-10 (July-Sept. 1983).
A numerical study of the velocity and temperature distributions that arise in a water body due to a thermal discharge such as that in a heat rejection or sensible energy storage system, has been carried out. The time-dependent distributions, as well as the steady-state solutions, have been obtained by the use of the alternating direction implicit method for the coupled vorticity transport and energy equations. The numerical procedure employed is outlined, indicating some of the salient features and problems that arise. The numerical scheme is employed for the study of various flow configurations and the dependence of the flow on the governing parameters, particularly on the mixed convection parameter, is determined. The results obtained are discussed in terms of the physical mechanisms involved. The uncoupled problem for an unheated discharge, is also considered and the coupled nature of the equations is evident in the results obtained for heated discharges. The relevance of the results obtained to the recirculating flow of interest in heat rejection and energy storage is discussed. (15 refs.)

107134 The stability of natural convection in a vertical fluid layer with internal heat generation. M.Takashima (Dept. of Phys., Osaka City Univ., Osaka, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2364-70 (July 1983).
Linear stability theory is applied to the problem of the stability of natural convection which occurs in a vertical fluid layer with uniformly distributed internal heat sources. The two parallel bounding plates are assumed to be maintained at constant and equal temperature. The power series method is adopted to obtain essentially exact values of the critical Reynolds number R_c, the critical wavenumber α_c and the critical wave speed c_c for ten finite values

of the Prandtl number P ranging from 0.01 to 1000. It is shown that the power series method is a powerful tool for linear stability problems when the values of αRM and αRPM are both less than about 8000, where M is the maximum value of $|W-c|$, W being the dimensionless velocity profile of the base flow.

107135 Double-diffusive plumes in unconfined and confined environments. T.J.McDougall (Res. School of Earth Sci., Australian Nat. Univ., Canberra, Australia).
J. Fluid Mech. (GB), vol.133, p.321-43 (Aug. 1983).
The author addresses two aspects of the influence of double diffusion on convection from point buoyancy sources (plumes). First he considers a double-diffusive convention acting in conjunction with buoyancy from an isolated source in an unconfined environment, and he studies the problem of when fluxes of properties occur in the opposite direction to that of the initial buoyancy. A simple dimensional analysis is in good agreement with the experimental data for these 'counterbuoyant' fluxes of properties. Secondly, the author considers a double-diffusive plume discharging into a confined environment. The plume now does not always reach the bottom (or top) of the confined environment, but can spread out into the environment at intermediate depths. Double-diffusive interfaces form, and he describes their development and the evolution of the density profile in the confined environment. A quantitative measure of the importance of double-diffusive convection in relation to the normal filling-box mechanism is obtained in the experiments by using the measured density profile, and this correlates well with a theoretically derived parameter B_ρ. (23 refs.)

107136 Effect of configuration of a confined space on the parameters of convective flows for symmetric temperature fields. S.N.Osipov, M.G.Pshonik (Belorussian Polytech. Inst., Minsk, Belorussian SSR).
J. Eng. Phys. (USA), vol.43, no.4, p.1073-8 (Oct. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.4, p.554-9 (Oct. 1982). [received: Sept. 1983]
The authors present a simplified method for calculating the parameters of convective flows in a confined space of various configurations. (7 refs.)

107137 Regenerative heat exchangers with periodic time variation of coolant temperature. V.M.Liventsov (A.A. Blagonravov Inst. of Machine Sci., Acad. of Sci., Moscow, USSR).
J. Eng. Phys. (USA), vol.43, no.4, p.1158-60 (Oct. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.4, p.653-5 (Oct. 1982). [received: Sept. 1983]
Analytic expressions are derived for the temperatures of a heat-exchanger solid and coolant. The author considers a heat exchanger whose heat-retaining elements have such characteristics that the temperature gradient in elements of the solid can be assumed negligibly small. In addition, they assume that the gas or liquid (from now on for brevity we refer only to a gas) moves through the free space of the heat exchanger of length L in such a way that the temperature of the gas or solid is the same at all points of a cross section of the heat exchanger perpendicular to the direction of gas flow. (2 refs.)

107138 Heat exchange and hydrodynamics during boiling on a horizontal tube bundle in a fluidized bed of solid particles. M.I.Berman, O.A.Chulkin (Odessa Polytech. Inst. of Refrigeration Industry, Odessa, USSR).
J. Eng. Phys. (USA), vol.43, no.5, p.1195-202 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.5, p.718-27 (Nov. 1982). [received: Sept. 1983]
The results are given on the experimental study of heat transfer and hydrodynamics with boiling on a horizontal tube bundle located in a dispersed bed of solid particles and of this process hydrodynamics simulation by gas bubbling within the fluid filtration rate variation via the bed (0-3.5)$v_{\mathrm{i.f.}}$. An analysis and correlation of experimental results are presented. (16 refs.)

107139 Experimental investigation of heat transfer in a centrifugal heat pipe with an optimized layer on heat-transfer agent. B.N.Krivosheev, M.P.Kukharskii, V.D.Portnov.
J. Eng. Phys. (USA), vol.43, no.5, p.1242-6 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.5, p.775-80 (Nov. 1982). [received: Sept. 1983]
Describes a technique and gives results of experimental investigations of special features of heat transfer in the evaporator and condenser sections of a centrifugal heat pipe with optimized thickness of the layer of heat transfer agent. (8 refs.)

107140 Conjugate problem of free convection of a non-Newtonian fluid in a vertical channel. Vu Zui Kuang, Z.P.Shul'man (A.V. Lykov Inst. of Heat & Mass Transfer, Acad. of Sci., Minsk, Belorussian SSR).
J. Eng. Phys. (USA), vol.43, no.5, p.1247-50 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.5, p.780-3 (Nov. 1982). [received: Sept. 1983]
Considers a conjugate problem of free convection of a non-Newtonian fluid with a power law in a plane vertical channel. The authors discuss the general formulation of the problem, give an analysis of particular cases, and show the effect of the parameters of the problem on convection. (6 refs.)

107141 Measurement of pulsations in heat flow on thermally loaded surfaces. N.V.Pilipenko, V.M.Klyuchev (Inst. of Precision Mech. & Optics, Leningrad, USSR).
J. Eng. Phys. (USA), vol.43, no.5, p.1271-4 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.5, p.808-11 (Nov. 1982). [received: Sept. 1983]
Pulsations in heat flow on a surface, washed by a fluidized bed, are measured with the help of a sensor. (10 refs.)

107142 Theoretical and experimental investigation of the absorption coefficient of different blackbody models. S.B.Kiselev, O.A.Kraev (All-Union Sci.-Res. Inst. of Physicotech. & Radiotech. Measurements, USSR).
J. Eng. Phys. (USA), vol.43, no.5, p.1283-6 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.5, p.822-6 (Nov. 1982). [received: Sept. 1983]
Numerical computations are performed and results are presented of an experimental investigation of the effective absorption coefficient of radiant heat flows of cavities of complex configuration. (8 refs.)

107143 Solution of a two-dimensional conjugate problem of stabilized heat transfer in the laminar flow of a liquid in a channel. Yu.N.Akkuratov, V.N.Mikhailov.
J. Eng. Phys. (USA), vol.44, no.1, p.32-4 (Jan. 1983). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.44, no.1, p.41-4 (Jan. 1983). [received: Sept. 1983]
A two-dimensional problem of conjugate heat exchange is solved by the method of integral boundary-value equations. Heat exchange in a body with cylindrical channels is studied. (6 refs.)

107144 Nonsteady heat transfer in diffusing systems. T.N.Abramenko, I.Mashtovskii, E.A.Shashkov, A.F.Zolotukhina (Inst. of Appl. Phys., Acad. of Sci., Minsk, Belorussian SSR).
J. Eng. Phys. (USA), vol.44, no.1, p.91-6 (Jan. 1983). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.44, no.1, p.108-14 (Jan. 1983). [received: Sept. 1983]
By the methods of the thermodynamics of irreversible processes and molecular-kinetic theory, it is shown that the effective thermal conductivities of mixtures measured by steady and nonsteady methods are not equal, which is confirmed by experimental data. (7 refs.)

107145 Period-doubling cascade in the Rayleigh-Benard convection. H.Yahata (Dept. of Phys., Hiroshima Univ., Hiroshima, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.6, p.1802-5 (June 1983).
Time evolution of convection in a rectangular box heated from below is studied using a 48-mode system which involves nonlinear temperature dependent density. For a certain set of the model parameter values, the motion undergoes a transition to chaos through successive period-doubling bifurcations with the increase of the Rayleigh number. (7 refs.)

107146 Heat and mass exchange of a droplet in a polyatomic gas. H.Lang (Max Planck Inst. fur Stromungsforschung, Gottingen, Germany).
Phys. Fluids (USA), vol.26, no.8, p.2109-14 (Aug. 1983).
Lee's method, combined with a generalized Grad's moment procedure, is used to calculate the heat and mass transport to and from a droplet in a polyatomic gas. A near-equilibrium and quasisteady situation is assumed. The results are represented by the transport coefficients of a symmetric Onsager matrix. The coefficients depend on the collision numbers of the internal degrees of freedom. Simple results are obtained by performing approximations analogous to the Mason and Monchick analysis for the case of the heat conductivity. (15 refs.)

107147 Zigzag instability and axisymmetric rolls in Rayleigh-Benard convection: the effects of curvature. P.Manneville, J.M.Piquemal (Div. de la Phys., CEA, CENS, Gif-sur-Yvette, France).
Phys. Rev. A (USA), vol.28, no.3, p.1774-90 (Sept. 1983).
Using a formalism adapted to slow spatio-temporal evolutions of phase perturbations to a perfect roll pattern, the authors show that 'zigzags' which relax in a diffusive way for the case with 'no-slip' (or 'rigid') boundaries are replaced by Busse's oscillatory mode for the case with 'stress-free' boundaries. The diffusion coefficient $D_\perp$ for zigzags, which is determined analytically using a perturbation expansion, has the form $D_\perp=\xi_0^2/\tau_0[(q-q_c)/q_c+N(\mathcal{P})(\mathcal{R}-\mathcal{R}^c)/R_2(\mathcal{P})\mathcal{R}^c]$ where $\mathcal{R}[=\mathcal{R}^c+R_2(\mathcal{P})\varepsilon^2+\ldots]$ is the Rayleigh number, $\mathcal{P}$ is the Prandtl number, ξ_0 is the coherence length, and τ_0 is the relaxation time; $\xi_0^2/\tau_0=5.685/(1.95+\mathcal{P}^{-1})$, $N(\mathcal{P})=0.166+23.04\mathcal{P}^{-1}+6.196\mathcal{P}^{-2}$, $R_2(\mathcal{P})=10.76-0.073\mathcal{P}^{-1}+0.128\mathcal{P}^{-2}$, and $\mathcal{R}^c-1707.8$ at the critical wave vector $q_c=3.116$ for no-slip boundaries. The curvature is seen to induce a large-scale flow which tends to convect the roll pattern. This flow is forbidden for concentric rolls in cylindrical geometry. This leads to a new wavelength-selection criterion which no longer corresponds to $D_\perp=0$. The corrected criterion is calculated for both no-slip and stress-free boundaries and is seen to behave in a similar way at the limit $\mathcal{P}\to 0$ in the two cases. The findings are in quantitative agreement with earlier numerical results and also with more recent approaches using the amplitude-equation formalism. (29 refs.)

107148 Neutron scattering study of convection in a double-diffusive system. T.Riste, K.Otnes (Inst. for Energy Technol., Kjeller, Norway).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.376-82 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Nonequilibrium systems with two or more order parameters and competing relaxation mechanisms display bifurcations and phase diagrams resembling equilibrium systems with multicritical properties. One example is a convecting nematic crystal in a vertical magnetic field. The authors' neutron scattering data give the time-averaged order parameters as a function of field (H) and temperature gradient (ΔT). They also investigate the time behaviour of the order parameters of different values of H and ΔT, and find steady, oscillatory and aperiodic states. They study the co-existence and transition between these states, and search for critical scattering. Some information is obtained on the evolution of the frequency spectrum and of the phase trajectory as ΔT is changed. (17 refs.)

107149 A theoretical analysis for laminar free convection: heat transfer from a vertical surface with arbitrary temperature distribution to a fluid with arbitrary temperature stratification. T.Fujii, S.Koyama, M.Koganei.
Rep. Res. Inst. Ind. Sci. Kyushu Univ. (Japan), no.74, p.129-34 (1983).
A theoretical analysis by means of an approximate integral method is presented for laminar free convection heat transfer from a vertical surface with vertically arbitrary temperature distribution to a fluid with arbitrary temperature stratification. An analytical solution of the local Nusselt number is presented. (no refs.)

107150 Prediction of the steady surface thermal plume. A.O.Demuren (Univ. of Karlsruhe, Karlsruhe, Germany).
Waerme- & Stoffuebertrag. (Germany), vol.17, no.4, p.193-200 (1983).
Presents a two-dimensional numerical procedure which employs finite-difference techniques to solve the partial-differential equations governing the steady flow and heat transfer of a surface thermal plume in the near field. The profiles of the velocities and temperature are assumed to be nearly uniform in the vertical direction. The rates of turbulent entrainment of ambient fluid are calculated from empirical relations, which take the influence of buoyancy in damping turbulent fluctuations into consideration. Computations of the lateral and longitudinal profiles of the velocities, temperature and layer depth are compared with laboratory measurements in heated discharges at densimetric Froude numbers in the range 1-4 and initial aspect ratios varying from 1 to 3. The agreement between the computations and the measurements is fairly good in most cases. (24 refs.)

107151 Transient thermal entrance heat transfer in laminar pipe flows with step change in pumping pressure. T.F.Lin, K.H.Hawks, W.Leidenfrost (Purdue Univ., West Lafayette, IN, USA).
Waerme- & Stoffuebertrag. (Germany), vol.17, no.4, p.201-9 (1983).
Analysis is made for the transient heat transfer phenomena in the thermal entrance region of laminar pipe flows. The transient results from both the change in flow field, a step change in pressure gradient from zero to a fixed value, and the change in thermal field, a step change in the inlet temperature. An exponential scheme has been employed to solve the energy equation with the presence of axial heat conduction in the fluid. In order to demonstrate the results more clearly, a modified Nusselt number is introduced. The unsteady axial variations of conventional Nusselt number, modified Nusselt number, bulk fluid temperature and pipe wall temperature are presented for water and air over a wide range of outside heat transfer coefficients. It is observed that the outside heat transfer coefficient has a significant influence on the transient heat transfer processes. The results can be comprehensively interpreted by the interactions among the axial convection, axial diffusion, and radial diffusion. (24 refs.)

107152 Convective heat transfer in a parallel plate channel with porous lining. M.N.Channabasappa, K.G.Umapathy, I.V.Nayak (Karnataka Regional Engng. Coll., Karnataka, India).
Waerme- & Stoffuebertrag. (Germany), vol.17, no.4, p.211-16 (1983).
Proposes a theoretical model for the study of flow and heat transfer in a parallel plate channel, one of whose walls is lined with non-erodible porous material, both the walls being kept at constant temperatures. The analysis uses Brinkman model in the porous medium and employs the velocity and temperature slips at the interface (the so called nominal surface). The influence of the thickness as well as the permeability of the porous medium on the flow field and Nusselt numbers at the walls is investigated. (7 refs.)

107153 Boiling heat transfer in a vertical tube with Freon 114. N.-E.Fagerholm, A.R.Ghazanfari, K.Kivioja (Helsinki Univ. of Technol., Espoo, Finland).
Waerme- & Stoffuebertrag. (Germany), vol.17, no.4, p.221-32 (1983).
Test results for boiling heat transfer coefficients for R114 in vertical stainless tubes are reported both for upflow and downflow direction. Results are compared with different formulas given in the literature. A recommendation of the numerical value of C_{sf} in Rohsenow's formula for fully developed nucleation boiling for R114/stainless steel combination is given. (26 refs.)

107154 Energy stability in the Benard problem for a fluid of second grade. B.Straughan (Forschungsinst. fur Math., Swiss Federal Inst. of Technol., Zurich, Switzerland).
Z. Angew. Math. & Phys. (Switzerland), vol.34, no.4, p.502-9 (July 1983).
The critical Rayleigh number for stability of convection in a fluid of second grade is obtained by means of the energy method. If the thermodynamic restrictions derived by Dunn and Fosdick (1974) are adopted the nonlinear energy boundary is shown to be the same as that of linear theory, and the nonexistence of subcritical instabilities is deduced. (19 refs.)

107155 Heat transfer in a MHD flow between eccentric disks rotating at different speeds. P.Raghupathi Rao, A.Ramachandra Rao (Dept. of Appl. Maths., Indian Inst. of Sci., Bangalore, India).
Z. Angew. Math. & Phys. (Switzerland), vol.34, no.4, p.550-5 (July 1983).
Heat transfer in a MHD flow between two infinite eccentric disks rotating with different speeds is considered when the plates are maintained at different temperatures. The results for the corresponding nonmagnetic case presented wrongly by Banerjee and Borkakati (1982) are corrected. It is observed that the eccentric rotation reduces the heat transfer on the disks. (7 refs.)

107156 The fluid physics module—new possibilities and applications. A.Gonfalone, H.Martinides (ESA/ESTEC, Noordwijk, Netherlands).
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.95-7
A number of studies have shown that it is possible to enhance the performance of the measuring techniques used on the Fluid Physics Module. After a brief review of the present capabilities, possible improvements of the visualisation system the fluid management system and the new interfaces are discussed. In conclusion, the objectives of a new set of experiments are presented. (4 refs.)

107157 The influence on the Marangoni effect of a surface tension minimum as a function of temperature in microgravity conditions. J.C.Legros, G.Petre, M.C.Limbourg-Fontaine (Univ. Libre de Bruxelles, Brussels, Belgium).
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.201-3
Microgravity experiments have been proposed to observe the influence of a surface tension minimum on the Maragoni convection. An experiment to be realized in the Texus 8 flight is described. The results of performed ground tests are given. (3 refs.)

107158 Influence of geometry on oscillatory Marangoni flows. R.Monti, L.G.Napolitano, G.Russo (Inst. of Aerodynamics 'U. Nobile', Univ. of Naples, Naples, Italy).
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.219-28
A series of on ground experiments have been performed in the computerized microgravity simulation facility of the Institute U. Nobile to study the influence of geometry and ambient parameters on oscillatory Marangoni flows. In particular, the dependence of the oscillation onset on the aspect ratio and shape factor of the floating zone has been found and evaluated for different Prandlt number Silicon Oils. The performance of the floating zone have been studied and the relationship among the different governing quantities has been tested and validated for the different regimes occurring during the heating and the cooling processes. The heat transfer efficiency decrease, in oscillatory Maragoni motion, has been experimentally demonstrated. (10 refs.)

107159 Influence of surface minimum on surface and buoyancy driven flows in Stokes regime. L.G.Napolitano, C.Golia (Istituto 'U. Nobile', Univ. di Napoli, Napoli, Italy).
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.229-33
Presents a theoretical analysis of Marangoni/Buoyant flows in liquids having a surface tension that exhibits a temperature dependence with a minimum. By assuming that the flow regime is of the Stokes type, a solution for the case of a liquid-gas system is given in terms of the stream function expressed as a sum of infinite series of complex-biorthogonal eigenfunctions. (6 refs.)

107160 Buoyancy-thermocapillary convection: the role of interfacial deformation. M.G.Velarde, J.L.Castillo (Fisica Fundamental, UNED, Madrid, Spain).
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.235-7
Linear (normal mode) and energy stability analyses have been developed to delineate regions of transition from a motionless state to steady patterned convection, oscillatory convection and finite amplitude convection in a binary liquid layer subjected to thermal constraints in double-diffusion when one of the boundaries is open to the ambient air. Specifically, the authors have concentrated on the role of the deformation of the open interface (liquid-air) and explicit results have been obtained in terms of the crispation (capillary) number. Results for the zero gravity problem (Rayleigh numbers set to zero) have also been obtained. (8 refs.)

107161 Investigation of convective flows in model systems of directional solidification configurations. G.Muller, G.Neumann (Inst. fur Werkstoffwissenschaften, Kristallabor Univ. Erlangen, Nurnberg, Germany).
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.285-94
Presents results for the investigation of convective flows in water in a vertical cylindrical test cell (height/diameter=5) heated from below. A sequence of different stable flow configuration is found. The time-dependent convection is characterised by well-defined frequencies. A comparison of these results with water is made with results of the directional solidification of InSb by the vertical Bridgman technique. A clear correlation of material inhomogeneities and unsteady thermal convection is possible by using theoretical results of the critical dimensionless Rayleigh number. (19 refs.)

47.30 ROTATIONAL FLOW AND VORTICITY

107162 A note on the bathtub vortex and the Earth's rotation. M.Sibulkin (Div. of Engng., Brown Univ., Providence, RI, USA).
Am. Sci. (USA), vol.71, no.4, p.352-3 (July-Aug. 1983).
The author studies whether the same forces govern the direction of rotation of a hurricane and that of water draining out of a bathtub?. (10 refs.)

107163 Steady flow of a polarizable viscous compressible fluid past a charged rotating sphere. A.E.M.A.Mohamed (Dept. of Maths., Ain Shams Univ., Cairo, Egypt).
Arabian J. Sci. & Eng. (GB), vol.8, no.2, p.99-102 (April 1983).
The flow of a polarizable viscous compressible fluid past a uniformly charged sphere rotating with constant angular velocity is studied. The equations of motion have been linearized by using a small parameter β. It was found that if the axis of rotation has the same direction as the flow, the rotation will not affect the drag force, while the couple on the sphere will receive correction of order β.

107164 Response of variations of free stream velocity on inviscid and incompressible flow past a wavy plate. V.K.Sud (Dept. of Biophys., All India Inst. of Medical Sci., New Delhi, India), M.P.Singh.
Int. J. Eng. Sci. (GB), vol.21, no.10, p.1253-65 (1983).
Studies the several types of free stream flow past the wavy plate. The solution is obtained in terms of free stream function by regular perturbation. It may be noted that the introduction of small vorticity does not affect the primary flow due to uniform free stream; however it tends to increase the maximum pressure at the wall. As in the case of uniform free stream, the extrema of the pressure coefficient along the X-direction coincide with those of the wall. The perturbed flow fields due to the presence of the wavy shaped boundary die out transversally at the same rate as in case of uniform stream. (5 refs.)

107165 Flow around turbulence promoters in parallel channels. II. Shedding vortex around cylinder. Y.Shiina (JAERI, Ibaraki, Japan).
J. Nucl. Sci. & Technol. (Japan), vol.20, no.5, p.389-99 (May 1983).
For pt.I see ibid., vol.19, p.720 (1982). Effects of walls on vortex shedding in developed channel flow were investigated putting a cylinder at the centre of channels or on a wall for the value of w/d from 2 to 4. Results were compared with the uniform flow result. When a cylinder was put at the centre of the channels, non-dimensional frequency plotted against Reynolds number agreed with the uniform flow result at low Reynolds number. However, it increased rapidly with Reynolds number, then it lay considerably above the uniform flow results at high Reynolds number. When a cylinder was put on a wall, non-dimensional frequency was considerably lower than the uniform flow result in the cases of $w/d=3$ and 4. In the case of $w/d=2$, however, frequency was higher than the uniform flow result at high Reynolds number. In all cases in the present study, the transition Reynolds number increased with decrease in the value of w/d. These results indicate that the increase in shedding frequency was due to the shift in velocity distribution from Poiseuille parabora in the wake region, which obviously increased with Reynolds number and with decrease in channel width. (19 refs.)

107166 Double diffusive convection in a rotating fluid. N.Riahi (Dept. of Theoretical & Appl. Mech., Univ. of Illinois, Urbana, IL, USA).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2620-1 (Aug. 1983).
Double diffusive convection is investigated in a rotating fluid layer with nearly impermeable boundaries. The new results on the instability of the steady motion and the dependence of the various physical quantities (such as the horizontal cells' size and the heat and solute fluxes) on the Rayleigh number R and the rotation parameter τ are discussed. (5 refs.)

107167 The lift on an aerofoil in starting flow. J.M.R.Graham (Dept. of Aeronautics, Imperial Coll., London, England).
J. Fluid Mech. (GB), vol.133, p.413-25 (Aug. 1983).
An analysis is given of the initial development of the lift on an aerofoil in inviscid starting flow. It is shown that because of the spiral shape of the vortex sheet shed initially from the trailing edge the lift and drag are both singular at the start of impulsive motion. This result is in contrast with the prediction of finite forces by methods that assume the vortex sheet to be initially planar. The effect of a steady rate of change of incidence following the sudden onset of transverse (heaving) motion of an aerofoil in a steady stream is also discussed. (9 refs.)

107168 On angles of separation in Stokes flows. M.E.O'Neill (Dept. of Math., Univ. Coll. London, London, England).
J. Fluid Mech. (GB), vol.133, p.427-42 (Aug. 1983).
A two-dimensional Stokes flow close to the line of contact of two touching cylinders or three-dimensional axisymmetric Stokes flow close to the point of contact of two touching bodies is shown in general to separate into infinite sets of eddies with angles of separation from the bodies which tend to 58.61° as the line or point of contact is approached. The flow near the vertex of a conical cusp is shown to be a system of nested toroidal vortices and the separation angles tend to 45.25° as the vertex is appraoched. Stokes flow between parallel planes or within a circular cylinder is shown in general to separate far from the generating disturbances with cellular eddy structure and separation angles which tend to 58.61° and 45.25° respectively. The mathematical equivalence of the various problems is established. (15 refs.)

107169 Method of designing a vortical diffuser. V.T.Bolov (S.P. Korolev Kuibyshev Aviation Inst., Kuibyshev, USSR).
J. Eng. Phys. (USA), vol.44, no.1, p.27-32 (Jan. 1983). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.44, no.1, p.35-41 (Jan. 1983). [received: Sept. 1983]
A method is proposed for theoretically determining the characteristics of a vortical diffuser. Comparison of the theoretical and experimental results shows that they agree well. (7 refs.)

47.35 WAVES

107170 On the effect of viscosity on some nonwave-motions of liquids with the free surface. V.D.Djordjevic (Univ. of Belgrade, Belgrade, Yugoslavia).
Acta Mech. (Austria), vol.48, no.3-4, p.219-26 (1983).
The author examines the case where phase velocity is purely imaginary, i.e. a wave-motion is not possible, and derives the equations describing the free surface when the initial perturbation is small compared with the undisturbed depth of liquid (linear case), as well as when these two quantities are of the same order of magnitude (purely nonlinear case). (5 refs.)

107171 Fast deflagration waves. D.S.Stewart, G.S.S.Ludford (Dept. of Theoretical & Appl. Mech., Cornell Univ., Ithaca, NY, USA).
J. Mec. Theor. & Appl. (France), vol.2, no.3, p.463-87 (1983).
The analysis of steady state deflagration waves invariably starts from the combustion approximation, i.e. equations for the leading non-constant terms in Mach-number expansions. Even then explicit formulas can only be obtained in the limit of large activation energy. There are circumstances, however, notably the transition from deflagration to detonation, when the Mach number $\mathcal{M}$ is not vanishingly small; the authors give a description, again using activation-energy asymptotics of such fast deflagrations. The principal result is not limited to Arrhenius kinetics, being a formula for $\mathcal{M}$ as a function of T_*, an ignition temperature near which the reaction is supposed to go very rapidly to completion. Such behavior can be exhibited by Arrhenius kinetics for large activation energy, the model for which the structure of the thin reaction zone and its associated perturbations outside are calculated. The calculations reveal a leakage of reactant through the zone, with its ultimate consumption over exponentially large distances downstream (exponential tail), and a 'Mach layer' behind the reaction zone for $\mathcal{M}$ small, in which a velocity adjustment takes place; both of these are missed by the combustion approximation. (11 refs.)

107172 Unsteady compressible Stokes layers on a disk. K.N.Venkatasiva Murthy (Dept. of Maths., S.K. Univ., Anantapur, India).
Def. Sci. J. (India), vol.33, no.2, p.127-35 (April 1983). [received: Aug. 1983]
The unsteady motion of a viscous compressible rotating gas bounded by a single infinite disk is studied when small amplitude torsional oscillations are superimposed on the disk. The generation and propagation of waves due to the interactions of compressibility, viscosity and rotation during the transient evolution is discussed. In comparison with the non-oscillatory case, the forcing frequency of the disk is capable of inducing several additional interesting features. (6 refs.)

107173 Parametric excitation of internal waves and convective instability in the fluid layer heated from above. S.G.Chefranov, A.G.Chefranov.
Izv. Akad. Nauk SSSR Fiz. Atmos. & Okeana, vol.19, no.7, p.741-9 (July 1983). In Russian. English translation in: *Izv. Acad. Sci. USSR Atmos. & Oceanic Phys. (USA)*
The criterion of a parametric instability stimulated by a weak time modulation (with amplitude η and period τ) of the gravity acceleration at $1\gg\eta>\tau/T_g$ (where T_g is a characteristic time scale of the dissipation processes for the space scales determined by the excited internal wave length) is obtained for the fluid layer heated from above. The method permits one to generate internal waves with mutually parallel fronts, since the wave amplitude amplification mechanism is not connected with the inclusion of additional anisotropy into the system. The possibility of parametric generation of internal waves with a doubled tidal period in ocean and in upper atmosphere is considered. (20 refs.)

107174 Propagation of obliquely incident water waves over a trench. J.T.Kirby, R.A.Dalrymple (Dept. of Civil Engng., Univ. of Delaware, Newark, DE, USA).
J. Fluid Mech. (GB), vol.133, p.47-63 (Aug. 1983).
The diffraction of obliquely incident surface waves by an asymmetric trench is investigated using linearized potential theory. A numerical solution is constructed by matching particular solutions for each subregion of constant depth along vertical boundaries; the resulting matrix equation is solved numerically. Several cases where the trench-parallel wavenumber component in the incident-wave region exceeds the wavenumber for freely propagating waves in the trench are investigated and are found to result in large reductions in wave transmission; however, reflection is not total owing to the finiteness of the obstacle. Results for one case are compared with data obtained from a small-scale wave-tank experiment. An approximate solution based on plane-wave modes is derived and compared with the numerical solution and, in the long-wave limit, with a previous analytic solution. (16 refs.)

107175 Long-time behaviour of a random inhomogeneous field of weakly nonlinear surface gravity waves. P.A.E.M.Janssen (Dept. of Mech. Engng., Univ. of Rochester, Rochester, NY, USA).
J. Fluid Mech. (GB), vol.133, p.113-32 (Aug. 1983).
The author investigates nonlinear interactions of narrowband, Gaussian-random, inhomogeneous wavetrains. Alber (1978) studied the stability of a homogeneous wave spectrum as a function of the width σ of the spectrum. For vanishing bandwidth the deterministic results of Benjamin & Feir (1967) on the instability of a uniform wavetrain were rediscovered whereas a homogeneous wave spectrum was found to be stable if the bandwidth is sufficiently large. Clearly a threshold for instability is present, and the author studies the long-time behaviour of a slightly unstable modulation by means of a multiple-timescale technique. Two interesting cases are found. For small but finite bandwidth σ the amplitude of the unstable modulation shows initially an overshoot, followed by an oscillation around the time-asymptotic value of the amplitude. This oscillation damps owing to phase mixing except for vanishing bandwidth because then the well-known Fermi-Pasta-Ulam recurrence is found. For large bandwidth, however, no overshoot is found since the damping is overwhelming. In both cases the instability is quenched because of a broadening of the spectrum. (30 refs.)

107176 Fluid-property effects on flow-generated waves on a compliant surface. R.J.Hansen (Fluid Dynamics Branch, Naval Res. Lab., Washington, DC, USA), D.L.Hunston.
J. Fluid Mech. (GB), vol.133, p.161-77 (Aug. 1983).
An experimental study of the influence of liquid viscosity and viscoelasticity on flow-generated waves on a compliant surface has been conducted in a rotating-disk geometry. Over the entire range of liquid properties studied,

each test gave a well-defined critical onset flow velocity above which waves were present and below which no waves were observed. This onset velocity increased with increasing fluid viscosity, and for sufficiently high viscosities the onset occurred when the flow on the disk was laminar rather than turbulent. The effects of liquid viscoelasticity were examined in the turbulent flow using dilute solutions of high-molecular-weight polymers. This type of viscoelasticity had little influence on the onset flow velocity in these circumstances, but did make the wave structure on the surface more regular in appearance than when the liquid was Newtonian. In all cases the wave structure produced a dramatic increase in drag similar to that expected for a rough surface. For the viscoelastic fluid, however, the increase in drag was much less than for a viscous fluid of the same viscosity. (11 refs.)

107177 Initial-value problems for Rossby waves in a shear flow with critical level. K.K.Tung (Dept. of Math., MIT, Cambridge, MA, USA).
J. Fluid Mech. (GB), vol.133, p.443-69 (Aug. 1983).
The time-dependent evolution of sheared Rossby waves starting from an initial disturbance is studied for the simple case in which the shear is uniform. The uniform-shear assumption allows explicit solutions to be obtained which are useful in addressing the issue of the long-time asymptotic approach to normal modes and in assessing the relative importance of viscosity, nonlinearity and time-dependence in the evolution of Rossby waves in the presence of critical layers. (34 refs.)

107178 Anisotropic surface waves on a viscous liquid under uniform magnetic and current fields. L.Debnath, M.Chakraborty (Dept. of Maths. & Phys., East Carolina Univ., Greenville, NC, USA).
J. Math. & Phys. Sci. (India), vol.17, no.3, p.265-78 (June 1983).
The initial value problem is solved for the generation and propagation of two-dimensional anisotropic dispersive surface waves due to a moving oscillatory surface pressure acting at the free surface of a conducting viscous liquid in the presence of horizontal magnetic and current fields. The problem is treated with the aid of generalized functions. It is shown that the wave motions are both dispersive and anisotropic due to the external fields. It is shown that there exists a critical value of the moving speed U of the surface pressure above and below which the ultimate steady-state wave systems have a different character. When U assumes its critical value, the solution for this viscous fluid model is non-singular while the corresponding solution in the inviscid liquid is singular in the sense that the wave-amplitude becomes infinite. The inclusion of a small viscosity introduces an exponential damping factor into the amplitude of each wave of the ultimate wave systems, and hence the waves die out at large distances. The most significant effect of the imposed magnetic and current fields is that the propagation of surface waves becomes strongly anisotropic. Several distinctive features of the wave systems in the viscous liquid are explored. (5 refs.)

(see also 28.70 Nuclear explosions, 52.35T Plasma shock waves)

107179 Structure of detonation pulsating front in porous and suspension explosives saturated by liquid. V.A.Danilenko, V.M.Kudinov (Acad. of Sci., Ukrainian SSR).
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.8, p.48-51 (1983). In Ukrainian.
The front structure of pulsating detonation waves in porous and suspension explosives saturated with liquid has been experimentally and numerically studied. It is shown that two types of structures are realized: one with a transverse wave and the other without a transverse wave with a longitudinal pulsating front. (12 refs.)

107180 A flux splitting method for the numerical simulation of one-dimensional compressible flow. S.R.Mulpuru (Whiteshell Nuclear Res. Establ., AECL, Pinawa, Manitoba, Canada).
Math. & Comput. Simulation (Netherlands), vol.25, no.4, p.309-20 (Aug. 1983).
Using the technique of flux vector splitting, it is shown that one-dimensional, inviscid, compressible-flow equations possess a split conservation form. Some attractive features of this form for the design of finite-difference solution schemes are discussed. Based on the split form, two solution schemes are designed. One is a first-order accurate 'upwind' scheme and the other is similar to the Lax-Wendroff scheme. A hybrid scheme, based on a nonlinear weighting of these two schemes, is demonstrated to yield results superior to either of the two in the solution of an ideal shock-tube problem. (21 refs.)

107181 Numerical design of a shockless transonic quasi-aircraft. M.Nakamura (Nat. Aerospace Lab., Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2706-10 (Aug. 1983).
In order to design a shock free aircraft in a transonic flow, a numerical simulation is carried out on a three-dimensional flow past a quasi-aircraft composed of a body, a sweepback wing and a tail unit in a physical space when the aircraft has no lift. The design condition of the shockless transonic flow is that the Mach number of the uniform flow is 0.87 and the aircraft angle of attack is zero. The applying method is the extended artificial flow method for a three-dimensional potential flow and the flow model has effects of walls of a wind tunnel.

47.40K Supersonic and hypersonic flows

107182 Application of unsteady laminar triple-deck theory to viscous-inviscid interactions from an oscillating flap in supersonic and subsonic flow. M.-K.Huang, G.R.Inger (Dept. of Aerospace Engng. Sci., Univ. of Colorado, Boulder, CO, USA).
J. Mec. Theor. & Appl. (France), vol.2, no.3, p.325-49 (1983).
Unsteady triple-deck theory is applied to an analysis of the local viscous-inviscid interaction of an idealized oscillating flap with a laminar boundary layer in either supersonic or subsonic external flow. For small flap amplitudes and small-to-moderate nondimensional frequencies, linearized analytical solutions by means of Fourier transformation are given for the pressure and shear distributions ahead of and behind the flap hinge. In the supersonic case, the predicted unsteady viscous effects reduce the pressure amplitude and spread it out upstream while causing it to lag the quasi-steady inviscid prediction (flap motion); this also results in an unsteady delay of incipient separation at the hinge to a higher flap amplitude. In contrast, the lowered unsteady viscous pressure distribution in purely subsonic flow slightly leads the flap motion, resulting in incipient separation at a smaller flap amplitude than the quasi-steady value. These trends are shown to be in qualitative agreement with available experimental data. (17 refs.)

107183 Simultaneous measurement of the stagnation temperature and specific mass flow rate in a hypersonic gas flow. G.E.Pervushin.
J. Eng. Phys. (USA), vol.43, no.5, p.1229-34 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.5, p.759-66 (Nov. 1982). [received: Sept. 1983]
The procedure and results of simultaneous measurement of the stagnation temperature and specific mass flow of gas in a hypersonic flow by means of heated-chamber impact tubes is discussed. The construction of the tubes is described. (9 refs.)

107184 Unified unsteady supersonic/hypersonic theory of flow past double wedge airfoils. W.H.Hui (Dept. of Appl. Maths., Univ. of Waterloo, Waterloo, Ontario, Canada).
Z. Angew. Math. & Phys. (Switzerland), vol.34, no.4, p.458-88 (July 1983).
A unified supersonic/hypersonic theory is given of flow past a pitching oscillating double wedge airfoil at arbitrary mean angle of attack. The amplitude and the (reduced) frequency parameter of the oscillation are assumed small and a perturbation method is employed. Closed form formulae are obtained for the stiffness and damping-in-pitch derivatives. They are exact with respect to the free stream Mach number, angle of attack and body thickness etc., provided only that the bow shock is attached to the leading edge. The theory predicts negative damping (instability) if the angle of attack, or the airfoil thickness is sufficiently large, or if the free stream Mach number is sufficiently low. It is shown to be in good agreement with experiments of Scruton et al. (1962). Comparisons with Van Dyke second order potential theory (1954) and with Lighthill piston theory (1953) are also given. Finally the theory may easily be extended to arbitrary smooth airfoils. (14 refs.)

107185 Three-dimensional effects on the focusing of weak shock waves. M.S.Cramer (Dept. of Engng. Sci. & Mech., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
J. Sound & Vib. (GB), vol.90, no.1, p.25-8 (8 Sept. 1983).
The focusing of weak three-dimensional shock waves at an arete is examined. By aligning the coordinate system with the principal directions on the initial shock surface it is shown that the focusing of an arbitrary three-dimensional shock may be regarded as locally two-dimensional. In addition, the scaling relating the two problems is given explicitly. (6 refs.)

107187 Small-disturbance stability of a non-isothermal tube flow of power law fluids. I. Derivation of the Orr-Sommerfeld equation extended. Z.Nowak, P.Cryglaszewski, J.Stacharska-Targosz (Tech. Univ., Cracow, Poland).
Acta Mech. (Austria), vol.48, no.3-4, p.157-63 (1983).
An attempt is made to study the flow stability just at the end of thermal entrance region where the temperature and velocity profiles are already fully developed and do not change in flow direction. Only the most simple thermal wall condition of constant temperature is assumed. A basic equation is derived that makes it possible to predict those critical Reynolds numbers over which the laminar tube flow becomes unstable. The equation derived is an extension of the well known Orr-Sommerfeld equation on purely viscous power law fluids with temperature dependent fluid consistency. Also the effects of viscous dissipation are included. (14 refs.)

107188 Small-disturbance stability of a non-isothermal tube flow of power law fluids. II. Numerical solution of the problem. Z.Nowak, P.Cryglaszewski, J.Stacharska-Targosz (Tech. Univ., Cracow, Poland).
Acta Mech. (Austria), vol.48, no.3-4, p.165-72 (1983).
For pt.I see ibid., vol.48, p.157-63 (1983). Selected numerical solutions are obtained to the eigenvalue problem formulated in pt.I, followed by a discussion of the results computed. The effects of both viscous dissipation and dependence of fluid consistency on temperature are also included. The method of searching for eigenvalues generated by respective eigensolutions consists—in the case of the Orr-Sommerfeld equation extended—in replacing the boundary-value problem by an equivalent initial-value problem. The last one has been attacked by means of the Adams-Moulton method. In order to make both problems equivalent, some additional boundary conditions have been postulated. (7 refs.)

107189 On Stokes' problem for a non-Newtonian fluid. K.R.Rajagopal (Univ. of Pittsburgh, Pittsburgh, PA, USA), T.Y.Na.Dearborn.
Acta Mech. (Austria), vol.48, no.3-4, p.233-9 (1983).
The fluids of the differential type are amongst the many models which have been employed to describe the non-Newtonian behavior exhibited by certain fluids. The authors extend the work of Stokes on the flow due to an oscillating plate for a special subclass of the fluids of the differential type, namely the incompressible fluids of grade three. (4 refs.)

107190 Flow of polymer solutions in porous media: inadequacy of the capillary model. J.L.Duda, S.-A.Hong, E.E.Klaus (Dept. of Chem. Engng., Pennsylvania State Univ., University Park, PA, USA).
Ind. & Eng. Chem., Fundam. (USA), vol.22, no.3, p.299-305 (Aug. 1983).
Experimental measurements show that conventional capillary models are inadequate for the description of the flow of nonlinear purely viscous solutions in porous media. A theoretical analysis indicates that any model for the flow of purely viscous polymer solutions in porous media must meet two criteria. First, the model must include expansion and contraction regions where excess pressure drops occur. Secondly, the rheological model for the fluid must include the characteristic transition from Newtonian behavior at low shear rates to shear-thinning behavior at high shear rates. (17 refs.)

107191 A non linear integral constitutive equation for viscoelastic fluids. J.M.Piau (Inst. de Mecanique de Grenoble, Saint Martin D'Heres, France).
Int. J. Eng. Sci. (GB), vol.21, no.10, p.1185-91 (1983).
An integral constitutive equation is written using a particular reference frame, built with unit vectors along the principal axes of the rate-of-deformation tensor, and using the associated intrinsic rate-of-rotation. This equation is easier to handle in calculations than corotational or codeformational models. The material functions for a rheological model including the first six terms of the constitutive equation have been studied in steady and unsteady shear flows, as well as in elongational flows. Material functions are readily written from six memory functions and no inconsistency comes out. (11 refs.)

107192 An analogy between rectilinear flow of plastic solids and Saint-Venant torsion. D.Durban, M.Sitzer (Dept. of Aeronautical Engng., Technion-Israel Inst. of Technol., Haifa, Israel).
Int. J. Eng. Sci. (GB), vol.21, no.10, p.1231-45 (1983).
Presents a new analogy between steady rectilinear flow of plastic materials and Saint-Venant torsion of elastic bars. Material behaviour is modelled as rigid/linear-hardening in conjunction with the von Mises flow rule. Focusing attention on steady flow through pipes with simply connected cross sections and perfectly rough walls the authors arrive at a Dirichlet-type problem. The mathematical formulation of this problem is analogous to that of Saint-Venant torsion of elastic bars. This analogy provides a number of exact solutions for steady rectilinear flow of plastic materials, through pipes with various cross sections. A few simple examples are discussed with emphasis on the growth of plastic boundary layer induced by wall friction. The influence of stress singularities near corners, at the boundary, is also investigated. (10 refs.)

107193 The spreading of a non-Newtonian liquid over a horizontal plane with intensive heat-transfer and mass-transfer processes on the surface of the layer. B.M.Khusid (Belorussian Polytech. Inst., Belorussian SSR).
J. Eng. Phys. (USA), vol.44, no.1, p.41-9 (Jan. 1983). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.44, no.1, p.51-60 (Jan. 1983). [received: Sept. 1983]
Investigates the flow of a layer of highly viscous non-Newtonian liquid over a horizontal plane, accompanied by intensive heat-transfer and mass-transfer processes. (14 refs.)

107194 Some finite element studies of extrusion. B.P.Huynh (Dept. of Mech. Engng., Univ. of Sydney, Sydney, NSW, Australia).
J. Non-Newtonian Fluid Mech. (Netherlands), vol.13, no.1, p.1-20 (July 1983).
Some finite element results of the non-isothermal extrusion process are presented. For Newtonian fluids, increasing the Nahme-Griffith number Na is found to increase the swelling ratio ε. The temperature distribution near the exit plane is a critical factor determining whether the extrudate would swell or contract relative to the isothermal, Newtonian case. In this way a recent theory by Tanner has been partly verified. For non-Newtonian fluids of the power-law type, where the viscosity is an exponential function of the temperature, increasing the exponential coefficient α (or decreasing the Peclet number Pe) causes an increase in ε when the power-law index n and the (modified) Brinkman number Br are kept fixed. However, the effects are small for shear-thinning fluids ($n<1$), but become stronger as n increases. On the other hand, at fixed Br and Pe (thus fixing α), increasing n causes rapid increases in ε. (17 refs.)

107195 The dependence of viscoelastic flow properties on the structure for styrene-butadiene copolymers. S.Ramachandran, E.B.Christiansen (Dept. of Chem. Engng., Univ. of Utah, Salt Lake City, UT, USA).
J. Non-Newtonian Fluid Mech. (Netherlands), vol.13, no.1, p.21-32 (July 1983).
The flow properties for 300 kg/m^3 solutions of four-arm, star-branched random and block styrene-butadiene-styrene copolymers in n-butylbenzene are presented. The viscosity, η, first and second normal stress differences, N_1 and N_2, and the steady shear compliance J, were determined as a function of the shear rate from cone-plate shearing data. The normal stress differences were determined from total normal force and plate pressure distribution data. Four sensitive, miniature, variable-capacitance pressure transducers mounted in the 7.4-cm plate with their approximately 2.4 mm in diameter pressure-sensing diaphragms flush with the plate surface provided data for the pressure distribution on the plate. In general, the data extend from the zero shear-rate viscosity region somewhat into the shear thinning region. (21 refs.)

107196 Rectilinear oscillatory viscoelastic flow in rectangular ducts. V.O'Brien, L.W.Ehrlich (Appl. Phys. Lab., Johns Hopkins Univ., Laurel, MD, USA).
J. Non-Newtonian Fluid Mech. (Netherlands), vol.13, no.1, p.33-45 (July 1983).
Rectilinear oscillatory pressure-driven motion of Oldroyd fluids with complex dynamic viscosity within straight rectangular ducts is described. The linear viscoelastic flow solutions are given as functions of a Stokes number, the ratio of cross-section side lengths and two Oldroyd time constants. Exact analysis and numerical approximate solutions via finite difference methods are shown, as well as suggestions for applying the theory to measure viscoelastic material properties. (13 refs.)

107197 On the motion of flexible threads in a Stokes shear field. J.D.Goddard, Y.-H.Huang (Dept. of Chem. Engng., Univ. of Southern California, Los Angeles, CA, USA).
J. Non-Newtonian Fluid Mech. (Netherlands), vol.13, no.1, p.47-62 (July 1983).
The authors consider the motion of a flexible threadlike filament suspended in an unbounded Stokes shear flow. As the extension of a well-established slender-body theory, they treat the case of a highly anisotropic drag relation, as reflected by a small ratio ϵ of transverse to longitudinal filament mobility. This provides one potentially useful model of hindered filament motion in highly concentrated filamentary suspensions. They investigate the permanence and stability of threads having uniform axial mobility, showing that only piecewise straight threads have permanent shape. Also they investigate the stability of fully-extended threads by means of both finite and infinitesimal stability analyses, and they provide equations for the growth rate of arbitrary initial disturbances. These are applied to simple shear and simple-extensional flows. Finally, they discuss the failure of the model for small but non-zero ϵ, near points of extreme curvature or 'entanglement', and the possible relevance to the rheology of fibrous composites and suspensions. (10 refs.)

107198 Experimental study of viscoelastic effects in a cylinder-plane lubricated contact. P.Doremus, J.-M.Piau (Inst. de Mecanique de Grenoble, Saint Martin d'Heres, France).
J. Non-Newtonian Fluid Mech. (Netherlands), vol.13, no.1, p.79-91 (July 1983).
The experimental study is related to the flow between a stationary small diameter needle and a moving drum of much larger diameter, seen as a moving plane. The authors' visualisation experimental setup adds new results regarding the flow behaviour of a polymer solution. This flow is compared to that of a Newtonian fluid used under the same kinematic conditions. Important differences between Newtonian and polymeric flows concern mainly streamlines, stagnation point positions, and reverse flow. A second experimental setup enabled them to obtain normal stress profiles along the needle wall and the flow rate through the gap. Results related to Newtonian flows are compared to the well-known analytical solutions for a bidimensional laminar flow. (5 refs.)

107199 Load enhancement effects by polymer-thickened oils in strip squeeze film flow. D.R.Oliver, M.Shahidullah (Dept. of Chem. Engng., Univ. of Birmingham, Birmingham, England).
J. Non-Newtonian Fluid Mech. (Netherlands), vol.13, no.1, p.93-102 (July 1983).
A modification to existing equipment is described which permits continuous squeeze-film flow to be obtained between parallel-sided strips of material, rather than between disc-shaped surfaces. Squeeze film flow is simulated by having liquid move through one of the surfaces via an array of equispaced holes. The squeeze-film behaviour of a Newtonian base oil is first tested at temperatures of 24°C and 55°C. Loads are in reasonable agreement with theoretical predictions and end effects (corrected by means of a guard ring) and fluid maldistribution effects are of small proportions. At the very highest liquid flowrates, the rapid liquid flow through the holes may influence the measured load. The polymer-thickened oils, representing 10 W/30 and 10 W/50 motor oils, are tested at temperatures of 24°C and 55°C. Both oils give marked load enhancement, compared with Newtonian oil under similar flow conditions, at the higher flowrates used. The 10 W/50 oil gives load enhancement of 76 per cent at 55°C, increasing rapidly with the simulated approach velocity. Fluid inertia effects in the squeeze film flow also increase the load significantly. (9 refs.)

107200 Transition of linear flexible-chain polymers from the fluid to the high-elastic state, spurt effect, and superspurting modes of their motion. G.V.Vonogradov, V.P.Protasov, V.E.Dreval (Inst. of Petrochem. Synthesis, Acad. of Sci., Moscow, USSR).
Polym. Bull. (Germany), vol.10, no.5-6, p.274-81 (Aug. 1983).
It is typical of high-molecular linear flexible-chain polymers with a narrow molecular-weight distribution to flow in a broad range of shear stresses similarly to Newtonian liquids. There exists a critical stress at which a spurt effect in the capillary or a jumpwise increase in volume output occurs. It corresponds to the transition of the polymers from the fluid into the rubbery (high-elastic) state. Under supercritical conditions the polymers break at the entrance to the capillary with the result that flowing through the latter is a stream formed by the polymers torn into pieces. For the first time, the regularities of supercritical motion of flexible chain linear polymers have been established. (5 refs.)

107201 Liquid dispersion in static in-line mixers. A.M.Al Taweel, L.D.Walker (Dept. of Chem. Engng., Tech. Univ. of Nova Scotia, Halifax, Canada).
Can. J. Chem. Eng. (Canada), vol.61, no.4, p.527-33 (Aug. 1983).
Liquid/liquid dispersion in static mixers has been investigated using Lightnin 'In-liner' mixing elements. The average drop size was found to decrease with increasing residence time, gradually approaching an equilibrium size whose magnitude agrees reasonably well with Kolmogoroff's theory for drop rupture in turbulent flows. The efficiency at which mechanical energy is utilized in the generation of new interfacial area was evaluated as a function of design and operating conditions and was found to be highest when the final drop size is much larger than the achievable equilibrium value. (19 refs.)

107202 A time-dependent approach for calculating steady inverse boundary-layer flows with separation. T.Cebeci (Mech. Engng. Dept., California State Univ., Long Beach, CA, USA).
Proc. R. Soc. London Ser. A (GB), vol.389, no.1796, p.171-8 (8 Sept. 1983).
The author describes an unsteady universe boundary-layer method that can be used to compute steady flows with separation. The method uses Keller's box method with Cebeci's Mechul function formulation. Depending on the complexity of the flow, two versions of the box method are used. In regions of positive streamwise velocity component u, the regular box is used; in regions where u becomes negative ($t>0$), the zigzag box is used. When $t=0$, and u becomes negative in some region across the layer, the regular box with the FLARE approximation is used. Calculations performed with this approach indicate that the use of a time dependent inverse boundary-layer method in which time is used as an iteration parameter provides a good approach in improving the accuracy of the solutions obtained from the FLARE approximation. (11 refs.)

107203 On the crenation of a compound liquid droplet. K.A.Landman (Dept. of Math., Southern Methodist Univ., Dallas, TX, USA).
Stud. Appl. Math. (USA), vol.69, no.1, p.51-73 (Aug. 1983).
The dynamic response of a small, very viscous liquid droplet composed of a core fluid surrounded by a thin fluid shell is examined as additional fluid is deposited into this incompressible shell. At early times, the shell incorporates the extra mass by ruffling its external surface, and a number of crenations form. These protuberances decrease in size and number over a longer time period, and eventually the droplet again becomes spherical, with an increased radius. This sequence of events and its dependence on the rheological properties of the fluids are studied. These effects compare well qualitatively with those obtained using a surface fluid rather than a finite thickness shell of fluid. The possible implications of this fluid model for the surface ruffling effects observed in cell biology are discussed. (20 refs.)

47.55B Cavitation

107204 The influence of surface tension on cavitating flow past a curved obstacle. J.-M.Vanden-Broeck (Dept. of Math., Univ. of Wisconsin-Madison, Madison, WI, USA).
J. Fluid Mech. (GB), vol.133, p.255-64 (Aug. 1983).
The problem of cavitating flow past a two-dimensional curved obstacle is considered. Surface tension is included in the dynamic boundary condition. A perturbation solution for small values of the surface tension is presented. It is found that the position of the separation points is uniquely determined by specifying the value of the Weber number and the contact angle at the separation points. In addition, for a given value of the Weber number there exists a particular position of the separation points for which the slope is continuous. This solution tends to the classical solution satisfying the Brillouin-Villat condition as the surface tension tends to zero. Graphs of the results for the cavitating flow past a circular cylinder are presented. (12 refs.)

107205 Experimental investigation of mass transfer from the surface of a sphere under conditions of large Reynolds numbers and cavitation on the surface. G.A.Aksel'rud, S.M.Orel (Lenin Komsomol Lvov Polytech. Inst., Lvov, Ukrainian SSR).
J. Eng. Phys. (USA), vol.44, no.1, p.67-9 (Jan. 1983). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.44, no.1, p.81-3 (Jan. 1983). [received: Sept. 1983]
Studies mass transfer from the surface of a sphere when a liquid flows around it under conditions of Reynolds numbers 10^3-5.10^5, and also when a cavitation cavern forms behind the sphere. (5 refs.)

47.55C Jets

107206 An experimental investigation of laminar axisymmetric submerged jets. G.W.Rankin, K.Sridhar, M.Arulraja, K.R.Kumar (Dept. of Mech. Engng., Univ. of Windsor, Windsor, Ontario, Canada).
J. Fluid Mech. (GB), vol.133, p.217-31 (Aug. 1983).
Detailed measurements of the velocity profiles in a laminar axisymmetric submerged jet of water were taken using a laser-Doppler anemometer. A non-intrusive measurement technique is particularly advantageous in this application owing to the unstable nature of the laminar jet and the destabilizing effect which objects submerged in the jet have. Flow visualization was employed to ensure that all of the measuring points were located within the laminar region of the jet. The variation of centreline velocity, jet half-radius and velocity-profile shape are investigated for various Reynolds numbers and axial distances. Emphasis is placed on the jet-development region; however, data from the fully developed region are also presented. Particular attention is given to determine the proper non-dimensional groups which are required to collapse the data. The predictions of a simple boundary-layer analysis are used as a guide in this regard and found to give an accurate representation of the flow field. (20 refs.)

107207 Universal equation of transient plane jet in concurrent stream. O.N.Bushmarin, E.Yu.Egorova, N.F.Trubitsyn (M.I. Kalinin Leningrad Polytech. Inst., Leningrad, USSR).
J. Eng. Phys. (USA), vol.43, no.5, p.1224-8 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.5, p.753-9 (Nov. 1982). [received: Sept. 1983]
An equation is derived and subsequently integrated which is 'universal' not only with respect to velocity of the concurrent stream and initial conditions of jet discharge but also with respect to choice of characteristic scale for the transverse coordinate. (3 refs.)

107208 Entrance section of a planar turbulent jet in transverse flow. T.A.Girshovich (Sergo Ordzhonikidze Moscow Aviation Inst., Moscow, USSR).
J. Eng. Phys. (USA), vol.44, no.1, p.15-20 (Jan. 1983). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.44, no.1, p.22-8 (Jan. 1983). [received: Sept. 1983]
The author presents a solution for the entrance section of a planar turbulent jet in a carrier stream, accounting for additional ejection of liquid in the upstream mixing zone. (6 refs.)

107209 An experiment on the noise source strengths in coaxial double jets. Y.Nakazono (Faculty of Engng., Kyushu Tokai Univ., Kumamoto, Japan).
J. Acoust. Soc. Jpn. (Japan), vol.39, no.6, p.367-73 (June 1983). In Japanese.
The distribution of noise source strengths in a coaxial double jet with main nozzle diameter 12 mm and nozzle exit area ratio 2.83 of bypass flow to main flow is measured by the use of a reflector-type directional microphone system. Sound pressure spectrum in the far-field which is predicted with the sound source distribution is in good agreement with the measurement by an omnidirectional microphone at each velocity ratio of the bypass jet to the core jet. Therefore, a reflector type directional microphone system is considered to be suited for the measurement of the sound source distribution in the coaxial double jet. Next, the author measures the pressure fluctuation in an incompressible jet flow with the use of a probe microphone with four static pressure holes and obtains the influence of correlation upon the far-field noise at each Strouhal number on the basis of the distribution of noise source strength and local pressure fluctuation. Moreover, the reasons for the noise increase or decrease of the double jet as opposed to the single jet is considered. (15 refs.)

107210 Speckle velocimetry study of vortex pairing in a low-Re unexcited jet. R.Meynart (Univ. Libre de Bruxelles, Service des Milieux Continus, Brussels, Belgium).
Phys. Fluids (USA), vol.26, no.8, p.2074-9 (Aug. 1983).
Application of speckle velocimetry in a round jet (Re=2300) provides instantaneous 2-D velocity fields and vorticity maps of the interaction between unstable vortices. Detailed descriptions of the pairing process and of the large-scale structures observed near the end of the potential core are obtained without excitation of the jet and without the smearing effects of the conditional sampling method. 47.55E Nozzles

107211 Hydraulic analogy for isentropic flow through a nozzle. J.S.Rao, V.V.R.Rao, V.Seshadri (Dept. of Mech. Engng., Indian Inst. of Technol., New Delhi, India).
Def. Sci. J. (India), vol.33, no.2, p.97-111 (April 1983). [received: Aug. 1983]
Modelling aspects of isentropic compressible gas flow using hydraulic analogy are discussed. Subsonic and supersonic flows through a typical nozzle are simulated as free surface incompressible water flow in an equivalent 2-*D* model on a water table. The results are first compared for the well known classical analogy in order to estimate experimental errors. Correction factors for pressure and temperature, to account for non-ideal compressible gas flow are presented and the results obtained on the water table are modified and compared with gas dynamic solution. Within the experimental errors, it is shown that the hydraulic analogy can be used as an effective tool for the study of two dimensional isentropic flows of gases. (11 refs.)

47.55H Stratified flows

107212 Effect of large-scale turbulence on the structure of the boundary layer in a density flow. B.I.Samolyubov, A.Yu.Pyrkin (Dept. of Phys. & Land Waters, Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.6, p.36-42 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.6, p.32-8 (1982).
The results of complex natural measurements in the upper contact zone of near-floor density flow are used to analyze the repeating cyclic transformations of the structure of the boundary layer of the flow which were observed by registrations lasting several hours. The authors establish the interdependence of the appearance of fine structure elements of the mixed layer in the stratified flow, such as the lens of translucent liquid, temperature inversions, minima in the velocity profiles and of the root-mean-square values of its fluctuations. An analysis of the results makes it possible to interpret the observed phenomena as the effects of generation and dissipation of outer-scale turbulent formation on the vertical structure of the boundary layer. 47.55K Multiphase flows

107213 Two-dimensional polydisperse flows with interphase mass exchange. V.I.Blagosklonov, A.L.Stasenko.
Power Eng. (J. Acad. Sci. USSR) (USA), vol.20, no.2, p.141-7 (1982). Translation of: *Izv. Akad. Nauk SSSR Energ. & Transp.*, vol.20, no.2, p.153-60 (1982).
A model of a system of equations for the gas-thermodynamics of a two-phase flow is considered; it takes into account present-day information about the interaction of an individual particle with the carrier gas (in particular, the influence of a substantial difference in their temperatures on the interphase exchange of momentum, energy, and mass) and is suitable for the description of polydisperse collision-free flows in cryogenic wind tunnels, nozzles, and jets. Results are reported for a numerical investigation of supersonic vapor-drop flow with specific initial spectrum over a wide range of particle masses (differing by more than factor of 10^3). A qualitative difference has been detected in the nature of the variation in dimensions of particles of different fractions (evaporation of large particles and ring condensation growth of small particles). (15 refs.)

107214 Motion of fluid particles in perturbed shear flows. K.Inoue (Nat. Aerospace Lab., Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2711-19 (Aug. 1983).
The motion of fluid particles in shear flows perturbed by unamplifying traveling sinusoidal waves is considered. The analogy between the formulation of the problem in terms of the stream function and the Hamiltonian dynamics is pointed out. For a perturbed wake type flow, an approximate analytical solution is obtained by employing the method of canonical transformation due to Hori (1966, 1967). (5 refs.)

107215 Flow past a liquid drop with a large non-uniform radial velocity. S.S.Sadhal (Dept. of Mech. Engng., Univ. of Southern California, Los Angeles, CA, USA), P.S.Ayyaswamy.
J. Fluid Mech. (GB), vol.133, p.65-81 (Aug. 1983).
The translation of a liquid drop experiencing a strong non-uniform radial velocity has been investigated. The situation arises when a moving liquid drop experiences condensation, evaporation or material decomposition at the surface. By simultaneously treating the flow fields inside and outside the drop, the authors have obtained physical results relevant to the problem. The magnitude of the radial velocity is allowed to be very large, but the drop motion is restricted to slow translation. The solution to the problem has been developed by considering a uniform radial flow with the translatory motion introduced as a perturbation. The role played by the inertial terms due to the strong radial field has been clearly delineated. The study has revealed several interesting features. An inward normal velocity on a slowly moving drop increases the drag. An increasing outward normal velocity decreases the drag up to a minimum beyond which it increases. The total drag force not only consists of contributions from the viscous and the form drags but also from the momentum transport at the interface. Since the liquid drop admits a non-zero tangential velocity, the tangential momentum convected by the radial velocity forms a part of this drag force. The circulation inside the drop decreases (increases) with an outward (inward) normal velocity. A sufficiently large non-uniform outward velocity causes the circulation to reverse. (15 refs.)

107216 On the calculation of separation bubbles. T.Cebeci (Mech. Engng. Dept., California State Univ., Long Beach, CA, USA), K.Stewartson.
J. Fluid Mech. (GB), vol.133, p.287-96 (Aug. 1983).
The interactive boundary-layer equations for a flat plate are solved numerically when the external velocity field is piecewise linear and would provoke separation if the response of the boundary layer were neglected. A comparable problem had already been solved by Briley using the full Navier-Stokes equations. The equations are solved for various values of the Reynolds number and x_0, a parameter defining the corner point of the external velocity. It is found that flows with a limited region of separation can be computed, but that, if x_0 is too large, the numerical procedure breaks down. Furthermore, this maximum value is a decreasing function of R and seems to approach the value 0.12 predicted by classical theory as $R \rightarrow \infty$. Comparison with Briley's results indicate a reasonable agreement except that different values of x_0 are appropriate. It is conjectured that, once x_0 increases above the acceptable maximum, rapid changes occur in the flow properties when R is large. (16 refs.)

107217 Mean flow in round bubble plumes. J.H.Milgram (Dept. of Ocean Engng., MIT, Cambridge, MA, USA).
J. Fluid Mech. (GB), vol.133, p.345-76 (Aug. 1983).
Previous experimental studies are reviewed and those whose data are deemed reliable are identified. New experiments at larger scale are described and the results are reported. These are combined with the reliable previous studies to form a data set covering heights from 3.66 to 50 m and gasflow rates from 0.0002 to 0.59 normal m^3/s. These wide-ranging data are combined with an integral theory for bubble plumes to determine functional relationships between local plume properties and the entrainment coefficient and the fraction of the momentum flux that is carried in the turbulent velocity fluctuations. These relationships together with the integral theory provide a set of equations that are suitable for numerical solution for the mean flow properties of any round bubble plume. Examples of the numerical solutions are presented and a comparison of one of these with existing experimental data is given. The relationships between the local plume properties and the entrainment coefficient and the momentum flux carried by the turbulence are interpreted to provide a qualitative understanding of the parameters involved and their influences on the plume. (17 refs.)

107218 Experimental study of the motion of solid particles in a turbulent gas flow. The transfer mechanism. L.I.Krupnik, V.N.Oleinik, V.G.Ainshtein.
J. Eng. Phys. (USA), vol.43, no.4, p.1055-61 (Oct. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.4, p.533-41 (Oct. 1982). [received: Sept. 1983]
A model accounting for particle interaction with channel walls and collisions between particles is proposed on the basis of analysis of experimental particle-velocity distribution functions. (15 refs.)

107219 Flow of dilute suspensions of deformable ellipsoidal particles in a plane channel. Kwak Van Dong, Z.V.Pasechnik, Yu.I.Shmakov (T.G. Shevchenko State Univ., Kiev, Ukrainian SSR).
J. Eng. Phys. (USA), vol.43, no.4, p.1079-83 (Oct. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.4, p.560-5 (Oct. 1982). [received: Sept. 1983]
The influence of the internal properties of deformable suspended particles on the laminar flow of suspensions in plane channels is investigated. (10 refs.)

107220 Critical two-phase flow in long channels. Z.P.Bil'der, V.V.Fisenko (Odessa Polytech. Inst., Odessa, USSR).
J. Eng. Phys. (USA), vol.43, no.5, p.1192-5 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.5, p.715-18 (Nov. 1982). [received: Sept. 1983]
Results are presented from experimental studies of the critical efflux of a two-phase flow through long channels. (6 refs.)

107221 Diffusion and mass transfer in moderately concentrated disperse system with small Peclet numbers. Yu.A.Buevich, S.P.Fedotov (A.M. Gor'skii Ural State Univ., Sverdlovsk, USSR).
J. Eng. Phys. (USA), vol.43, no.5, p.1213-19 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.5, p.740-8 (Nov. 1982). [received: Sept. 1983]
Nonsteady diffusion in a system with identical nonconducting spherical particles is considered, taking account of mass transfer with these particles. (18 refs.)

107222 Applicability of approximate models in calculating the boundary region in dust-laden flows. O.V.Molin, F.E.Spokoinyi (Odessa Engng. Inst. of Refrigeration Industry, Odessa, USSR).
J. Eng. Phys. (USA), vol.44, no.1, p.21-6 (Jan. 1983). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.44, no.1, p.28-35 (Jan. 1983). [received: Sept. 1983]
The limits of application of 'single-particle' and 'quasihomogeneous liquid' models are established on the basis of analysis of Couette flow for a dust-laden gas. (12 refs.)

107223 Suspension of solid particles in a Newtonian fluid. T.Levy (Dept. de Math., Univ. de Rouen, Rouen, France), E.Sanchez-Palencia.
J. Non-Newtonian Fluid Mech. (Netherlands), vol.13, no.1, p.63-78 (July 1983).
The authors consider the motion of a Newtonian fluid containing solid particles in the case of high concentration (the partial volume of solid is comparable to that of fluid) by using a homogenization technique associated with the small parameter ϵ (the ratio of the particle length to the characteristic macroscopical length). The limit behavior as $\epsilon \rightarrow 0$ is that of fluid with anisotropy properties associated with a microstructure. The evolution equations for the limit flow and for the microstructure are given. (7 refs.)

107224 Strong spherical two-phase blowoff of liquid metals into vacuum. K.Hornung (Hochschule der Bundeswehr Munchen, Neubiberg, Germany).
Phys. Fluids (USA), vol.26, no.8, p.2120-7 (Aug. 1983).
The process of the spherical nonequilibrium expansion of a homogeneous metal liquid-vapor cloud into a vacuum is considered for high initial entropies (up to 0.9 S_{crit}) and high expansion velocities (several km/sec). Starting from phase equilibrium, the system successively passes through stages of increasing nonequilibrium, determined by the characteristic times of the expansion as well as heat and mass transfer and ends up in a state of maximum nonequilibrium, where there is no more contact between the phases. Results are discussed for different metallic fluids. (22 refs.)

107225 Prediction of the film vaporization of hydrocarbons in a stream of hot air. H.Eickhoff (Inst. fur Antriebstech., DFVLR, Koln, Germany).
Waerme- & Stoffuebertrag. (Germany), vol.17, no.4, p.233-6 (1983). In German.
The results of an analytical approximation method to predict the film vaporization are compared with the predictions of a finite difference method of Hermitian type. The analytically estimated rate of vaporization of different hydrocarbons, which is the most important value for practical applications, deviates only a few percent from the numerically estimated value. (8 refs.)

107226 Analysis of homogeneous unary and binary condensation processes. W.Studzinksi (Inst. Maszyn Przeplywowych, PAN, Gdansk, Poland), R.A.Zahoransky, S.L.K.Wittig.
Waerme- & Stoffuebertrag. (Germany), vol.17, no.4, p.241-50 (1983). In German.
The modified theoretical analysis of the binary nucleation and the subsequent heterogeneous droplet growth presented includes the limiting unary condensation. By introducing a new parameter ζ, the ratio of the reduced partial molecular volumes, it is possible to illustrate the changing binary droplet composition during their growth from the metastable equilibrium. A complete calculation of the droplet growth confirms the assumptions. As a typical result it is found, that the binary droplets will obtain their equilibrium composition within 10^{-5} s—starting with their metastable value. The comparison of the droplet growth model and parallel measurements with water-ethanol mixtures in the expansion fan of a shock tube confirms the results. (26 refs.)

107227 Experimental study of filmwise condensation considering wave initiation. H.Sofrata (Mech. Engng. Dept., King Saud Univ., Riyadh, Saudi Arabia).
Waerme- & Stoffuebertrag. (Germany), vol.17, no.4, p.251-60 (1983).
The problem of wavy filmwise condensation was recently investigated using both analytical and numerical concepts. The analytical solution assumed the film profile as a simple sine wave moving with a constant phase velocity and the problem was reduced to a closed integral form, while the numerical solution considers variations in the wave length and amplitude of the proposed sine wavy free surface. In order to find out the validity of the suggested theoretical models, an experimental test rig was installed, where the experimental parameters were controlled to generate data in the range of $40 < Re < 200$. The results of this work demonstrate the possibility of accurate simulation of long vertical condensers using a laboratory set of reasonable dimensions. This simulation yields better results when the thermal and hydrodynamical average quantities at the entrance are properly corrected. Good agreement was found by comparing the generated experimental data, together with other data, with the analytical and numerical models. Empirical formulas for heat transfer were considered and differences between the correlation coefficients were found to be mainly due to improper definition of the validity ranges of the used dimensionless groups. More realistic definition for the range of validity was introduced with these empirical formulas. (20 refs.)

107228 The effect of boundary absorption on longitudinal dispersion in steady laminar flows. C.Van den Broeck, E.Dekempeneer (Dept. Natuurkunde, Vrije Univ. Brussel, Brussels, Belgium).
Z. Angew. Math. & Phys. (Switzerland), vol.34, no.4, p.489-501 (July 1983).
The effect of absorbing or semi-absorbing boundary conditions on the dispersion of suspended particles in a flowing fluid are investigated. In the case of absorbing boundary conditions, the dispersion of absorption times gives rise to an increase in the longitudinal dispersion of the absorbed particles. The effect of sedimentation is discussed. For semi-absorbing boundary conditions, the longitudinal dispersion is increased by an amount proportional to the dispersion of the time spent by the particles in the semi-absorbing state. The relative importance of this dispersion versus Taylor diffusion is discussed. (16 refs.)

107229 Fluid physics under reduced gravity—an overview. I.Da-Riva (Aerodynamics Lab., Polytech. Univ. of Madrid, Madrid, Spain), L.G.Napolitano.
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.5-12
Problems related to several fluid physics experiments to be performed under reduced gravity, onboard Spacelab (1st Mission), are discussed. Special attention is placed on parallel and preparatory work on Earth, which could throw some light on the opportunity, present interest and limitations of those experiments. The need for strong supporting fundamental research and, in particular, a more precise determination of the parameters involved, is stressed. (63 refs.)

107230 Thermocapillary migration of bubbles in liquids showing relaxation of surface tension. A.Bewersdorff (DFVLR, Inst. for Space Simulation, Koln-Porz, Germany).
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.41-4
The migration of macroscopic, gaseous or liquid particles, that is caused by temperature gradients could become important in many experiments when buoyancy is eliminated. The basic formula for bubble motion, that was first derived by Young, is valid only for rather idealized situations. The author extends the analysis of thermocapillary migration of bubbles to the case where surface tension is also time-dependent. As a new surface is created continuously on the leading hemisphere of a moving bubble a counterforce appears that slows the forward motion. A modified formula for particle velocity is presented and implications for μg-experiments are discussed. (9 refs.)

107231 Bubble motion under reduced gravity. A.Crespo, F.Manuel (ETSI Industriales, Univ. Politecnica, Madrid, Spain).
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.45-9
Three mechanisms to make bubbles move are considered: thermocapillary forces, radiation pressure gradient, and centrifugal force. A method to estimate thermocapillary velocities, based on energy conservation is presented; the discrepancies with experimental results are analyzed. The bubble movement due to radiation pressure gradient is estimated for the single bubble, and distributed bubbles cases: the effect of sound velocity variation with void fraction and frequency is considered. The problem of the escape of the single bubble that is formed inside a liquid mass, by the migration, due to centrifugal forces, of distributed bubbles, is studied. The case of the liquid mass moving as a vortex is considered as a limiting situation of non-uniform angular velocity. (23 refs.)

107232 On thermally-driven movement of drops in microgravity conditions. A.El Kouraychi, F.Feuillebois, A.Lasek (Lab. d'Aerothermique, CNRS, Meudon, France).
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.51-4
A liquid drop is embedded in a non-miscible liquid under microgravity conditions. A temperature gradient imposed to the outer liquid induces a gradient of surface tension on the surface of the drop. The resulting stresses set the drop into motion. The flow and temperature fields are calculated as expansions for small Marangoni number (analogous to a Reynolds number). The 0^{th} order solution yields the velocity of the drop. The deformation is of order 2. It is obtained by solving first the velocity field to order 1. (3 refs.)

47.55M Flow through porous media

107233 Slow viscous incompressible fluid flow through a wall perforated by periodically distributed holes. E.Sanchez-Palencia (Univ. Paris VI, Paris, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.21, p.1629-32 (13 June 1983). In French.
The steady flow of an incompressible viscous fluid is considered in the Stokes approximation. The fluid domain contains a wall hollowed by holes forming a periodic lattice. The asymptotic behavior when the size of the holes, as well as their mutual distances, tend to zero, is given. In particular, it is shown that the filtration velocity tends to a value which is independent of the point on the wall. (3 refs.)

107234 Analysis of transport processes with granular media using the constricted tube model. H.Pendse, Hsu-Wen Chiang, Chi Tien (Dept. of Chem. Engng., Syracuse Univ., Syracuse, NY, USA).
Chem. Eng. Sci. (GB), vol.38, no.8, p.1137-50 (1983).
Four kinds of transport processes occurring in granular media were studied, using the recently formulated constricted tube model for media characterization. The problems considered were: (a) momentum transfer associated with the flow through the media; (b) convective mass transfer; (c) axial dispersion; and (d) collection of aerosol particles in granular beds. Special emphasis was placed on the effect of the wall geometry of the constricted tube on the relevant relationships obtained from model predictions. (36 refs.)

107235 Hydrodynamics of constrained inverse fludization and semifluidization in a gas-liquid-solid system. Song-Hsing Chern, Katsuhiko Muroyama, Liang-Shih Fan (Dept. of Chem. Engng., Ohio State Univ., Columbus, OH, USA).
Chem. Eng. Sci. (GB), vol.38, no.8, p.1167-74 (1983).
Experiments were conducted to study the hydrodynamic behavior of the constrained inverse gas-liquid-solid fluidized bed and the semifluidized bed where the liquid is the continuous phase. Also included in the experiments was a study of the hydrodynamic behavior of countercurrent flow of gas and liquid in a packed bed. This part of the study simulates the packed section of a constrained inverse semifluidized bed. A mathematical model is developed to account for the friction factor between the liquid and solid in the packed bed. The gas hold-up and friction factor of the packed bed are analyzed and empirically correlated. Wallis' drift flux model is modified to describe the gas hold-up in a constrained inverse fluidized bed. For the constrained inverse semifluidized bed, the gas hold-up in the fluidized section, and height of the packed section were investigated. (8 refs.)

107236 A unified model for particulate expansion of fluidised beds and flow in fixed porous media. P.U.Foscolo, L.G.Gibilaro, S.P.Waldram (Dept. of Chem. & Biochem. Engng., Univ. Coll. London, London, England).
Chem. Eng. Sci. (GB), vol.38, no.8, p.1251-60 (1983).
A model is derived for a fluidised bed that enables its steady state particulate expansion to be predicted as a funtion of superficial velocity from the initial (packed bed) condition to the final fully expanded (single suspended particle) state. These predictions are in good agreement with the literature empirical correlations and functional dependencies over the full range of flow conditions. The derivations incorporate revisions in the form of the pressure drop correlations for flow in porous media that are justified on theoretical and empirical grounds. (16 refs.)

107237 Estimation of liquid film mass transfer coefficients for randomly packed absorption columns. P.H.Au-Yeung, A.B.Ponter (Dept. of Chem. & Chem. Engng., Michigan Technol. Univ., Houghton, MI, USA).
Can. J. Chem. Eng. (Canada), vol.61, no.4, p.481-93 (Aug. 1983).
Empirical and theoretical correlations, published since 1940 are reported which predict liquid film mass transfer coefficients in packed columns. Brief comments on the usefulness of the equations are given together with the range of operating variables, where available. Dimensional constants in the empirical correlations have been recalculated for the cases where the original values were not in SI units. (54 refs.)

107238 Hydrodynamics and mass transfer characteristics of co-current downflow packed tube columns. V.K.Patil, M.M.Sharma (Dept. of Chem. Technol., Univ. of Bombay, Bombay, India).
Can. J. Chem. Eng. (Canada), vol.61, no.4, p.509-16 (Aug. 1983).
Hydrodynamics and effective interfacial area in a 25 mm ID packed tube column were studied over a wide range of operating conditions for demister pad packings (DPP). Flow maps have been prepared. Values of effective interfacial area as high as 1880 m^{-1} in the spray flow regime were obtained. Data on pressure drop and effective interfacial area have been correlated for different flow regimes. Values of liquid side volumetric mass transfer coefficient, $k_L\mathbf{a}$, were measured by absorption and desorption of oxygen in different packed tube columns containing Pall rings (standard and low height to dia. ratio), multifilament wire gauge packings (MFWGP) and DPP. $k_L\mathbf{a}$ was found to vary from 0.017 to 0.34 s^{-1} for DPP. (12 refs.)

107239 Mass transfer characteristics of low H/D bubble columns. J.S.Gopal, M.M.Sharma (Dept. of Chem. Technol., Univ. of Bombay, Bombay, India).
Can. J. Chem. Eng. (Canada), vol.61, no.4, p.517-26 (Aug. 1983).
The mass transfer characteristics of 0.2, 0.6 and 1.0 m diameter bubble columns having a low height to diameter ratio ($0.6<H/D<4$) and operated at low superficial gas velocities ($0.01<V_G<0.08$ m/s) were investigated. Different types of spargers were used to study their effect on the column performance. The values of effective interfacial area, **a**, and volumetric mass transfer coefficient, $k_L\mathbf{a}$, were measured by using chemical methods. The values of **a** and $k_L\mathbf{a}$ were found to vary from 40 to 420 m^2/m^3 of clear liquid volume and from 0.01 to 0.16 s^{-1}, respectively, in the range of V_G and V_L covered in this investigation. The value of the liquid-side mass transfer coefficient, k_L, was found to vary from 3×10^{-4} to 7×10^{-4} m/s. The effect of the physical properties of the system on the values of **a** was also investigated. (35 refs.)

107240 Behaviour of vapour bubbles growing at a wall with forced flow. M.G.Cooper, K.Mori, C.R.Stone (Dept. of Engng. Sci., Oxford Univ., Oxford, England).
Int. J. Heat & Mass Transfer (GB), vol.26, no.10, p.1489-507 (Oct. 1983).
Experiments are reported in which individual bubbles are grown at a wall into initially isothermal supersaturated liquid moving relative to the wall, with independent control of the velocity and gravity fields. Cine observations of the bubble motion could be simply explained by non-dimensional groups involving bubble growth, fluid velocity and gravity. There was no indication of surface tension affecting overall bubble motion by causing bubbles to 'stick' at the wall. Thermometers on the wall surface indicated the extent of the region of dry wall below the bubble, and that was found to be smaller than suggested by other workers. The observations of previous workers may have been affected by a 'mirage', caused by variation of refractive index in the thermal boundary layer at the wall. (17 refs.)

107241 The diffusion of a fluid through a highly elastic spherical membrane. K.R.Rajagopal (Dept. of Mech. Engng., Univ. of Pittsburgh, Pittsburgh, PA, USA), A.S.Wineman, J.J.-J.Shi.
Int. J. Eng. Sci. (GB), vol.21, no.10, p.1171-83 (1983).
There are several problems of practical interest of which the problem of filtration is one where a membrane theory for diffusion would be appropriate. It is the authors' aim to develop such a membrane theory which would be applicable in the case of interacting continua. The membrane theory as developed by Green and Adkins (1960) for elastic solids forms the basis for the work. It is, however, found that modifications have to be made to the theory if it is to be compatible with the theory of interacting continua. (8 refs.)

107242 The permeability of a random array of identical rigid-spheres. S.Itoh (Dept. of Phys., Tokyo Metropolitan Univ., Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2379-88 (July 1983).
The permeability of a random array of identical rigid-spheres is determined as a function of the radius, *a*, and the volume concentration, *c*, of the spheres. A statistical formulation due to Lundgren is used here. A particular state formed around a test sphere, which is called the intermediate layer, is taken into consideration by adding the radial dependence of a coefficient of a Darcy resistance. A resultant equation is solved approximately by Galerkin's method, then the permeability is derived from the solution by using the self-consistency condition. It agrees with the experimental data near $c=2/3$. Thus, the formula for the permeability of the densely packed bed of spheres is improved.

107243 Procedure for calculating a conductive heat exchanger. V.F.Stepanchuk, A.F.Shilo, V.V.Kozhushko, E.G.Zavadovskii (Belorussian Polytech. Inst., Minsk, Belorussian SSR).
J. Eng. Phys. (USA), vol.43, no.4, p.1154-8 (Oct. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.4, p.648-53 (Oct. 1982). [received: Sept. 1983]
In a number of devices a fluid is heated as it flows through a porous wall or a metal wall with a high thermal conductivity which has channels containing the flowing fluid. There naturally arise problems of finding the temperature distribution in the material of such a wall heat exchanger, the temperature change of the flowing fluid, and the amount of heat transferred for given geometric parameters of the wall heat exchanger and given values of the initial temperature and the flow rate of the fluid. To simplify the problems the authors make the following assumptions: (1) the thermal and physical properties and the heat-transfer characteristics are constants; (2) end effects related to the finite dimensions of the wall heat exchanger can be neglected, i.e. they assume an infinite porous wall; (3) heat transfer through the skeleton of the wall is by conduction only in the direction normal to the boundary surfaces, i.e. the temperature gradient in the transverse direction can be neglected. (2 refs.)

47.60 FLOWS IN DUCTS, CHANNELS, AND CONDUITS

(for biological fluid dynamics, see 87.45)

107244 Behavior of air-liquid surface moving downward in a straight pipe. K.Murakami (Faculty of Engng., Ehime Univ., Matsuyama, Japan), N.Isshiki, H.Yamauchi.
Bull. JSME (Japan), vol.26, no.215, p.770-7 (May 1983).
An experimental study on the behavior of the air-liquid surface in various vertical and circular pipes is described. The case when a liquid piston is suddenly started from a vertical pipe which is previously filled up with a liquid and pressurized air on the top, is examined. It is known that the measured velocity of the tip of the surface agrees approximately with the simplest one-dimensional model, and the shape of the surface is divided into two areas; one is flat shape for the case of nearly constant velocity, and the other is spherical shape accompanied with an accelerating velocity. And further, the effects of an obstacle on the wall on the air-liquid surface behavior are observed, and it is found that sometimes a turbulence appears on the surface and grows up sharply, and the condition for the growth of the disturbance depends on Reynolds number and stability number. (9 refs.)

107245 The residence time distribution for laminar flow in an annulus with negligible diffusion. V.Pechoe (Res. Inst. of Man-Made Fibers, Svit, Czechoslovakia).
Chem. Eng. Sci. (GB), vol.38, no.8, p.1341-2 (1983).
The author develops an expression for the density of residence time distribution (RTD) for annular flow (Newtonian and power-law) using the theoretical A.G. Frederickson and R.B. Bird (1958) velocity profile, and compares this RTD with the approximate one of S.H. Lin (1980). (6 refs.)

107246 Condensation of vapor in stream with surface-active substances. V.A.Ageev, L.I.Seleznev.
Power Eng. (J. Acad. Sci. USSR) (USA), vol.20, no.6, p.109-12 (1982). Translation of: *Izv. Akad. Nauk SSSR Energ. & Transp.*, vol.20, no.6, p.136-9 (1982).
A theoretical description is given of spontaneous condensation during adiabatic expansion in the presence of surface-active substances; calculated results are compared with experiment. (6 refs.)

107247 Unsteady viscous flow down an inclined open channel with naturally permeable bed. J.S.Chaudhary, P.C.Gupta (Dept. of Maths., Agra Coll., Agra, India).
Def. Sci. J. (India), vol.33, no.2, p.159-63 (April 1983). [received: Aug. 1983]
The exact velocity distribution for the flow of viscous incompressible fluid in an inclined channel with naturally permeable bed has been obtained by using the Laplace transform and the finite Fourier sine transform technique. It has been assumed that (i) the fluid flows in the steady state for $t\leq 0$, (ii) unsteady state occurs at $t>0$, and (iii) unsteady state motion is influenced by time dependent pressure gradient. (6 refs.)

107248 On the stability of plane Poiseuille flow to finite-amplitude disturbances, considering the higher-order Landau coefficients. P.K.Sen (Dept. of Appl. Mech., Indian Inst. of Technol., New Delhi, India), D.Venkateswarlu.
J. Fluid Mech. (GB), vol.133, p.179-206 (Aug. 1983).
A study has been made of the Stuart (1960)-Watson (1960) formalism as applied to plane Poiseuille flow. In particular, the higher-order Landau coefficients have been calculated for the Reynolds & Potter (1967) method and for the Watson (1960) method. The results have been used to study the convergence of the Stuart-Landau series. A convergence curve in the (α,R)-plane has been obtained by using suitable Domb-Sykes plots. In the region of poor convergence of the series, and also in a part of the divergent region of the series, it has been found that the Shanks (1955) method, using the $e_1{}^m$ transformation, serves as a very effective way of finding the proper sum of the series, or of finding the proper antilimit of the series. The results for the velocity calculations at $R=5000$ are in very good agreement with Herbert's (1977) Fourier-truncation method using $N=4$. The Watson method and the Reynolds & Potter method have also been compared in the subcritical and supercritical regions. It is found in the supercritical region that there is not much difference in the results by the 'true problem' of Watson and the 'false problem' of Reynolds & Potter when the respective series in both methods are summed by the Shanks method. This fact could possibly be capitalized upon in the subcritical region, where the Watson method is difficult to apply. (19 refs.)

107249 Diffusion in oscillatory pipe flow. E.J.Watson (Dept. of Math., Univ. of Manchester, Manchester, England).
J. Fluid Mech. (GB), vol.133, p.233-44 (Aug. 1983).
The rate of mass transfer of a diffusing substance along a pipe is augmented by an oscillatory motion of the ambient fluid in the pipe. The increase of the flux is evaluated for the cases of a circular pipe and of a two-dimensional channel. Results are given for a general cross-section in the limiting cases of slow and fast oscillations of the flow. (8 refs.)

107250 Unidimensional model for pipe flow of a gas mixture allowing for condensation. N.I.Zverev, Yu.P.Korotaev, V.I.Maron (I.M. Gubkin Moscow Inst. of Petrochem. & Gas Industry, Moscow, USSR).
J. Eng. Phys. (USA), vol.43, no.5, p.1202-7 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.5, p.727-33 (Nov. 1982). [received: Sept. 1983]
Condensation kinetics is described with allowance for the dependence of the temperature of the phase transformation on the pressure and concentration of the condensing gas at the phase boundary. (2 refs.)

107251 Hydrodynamic regimes of a liquid in a smooth-walled rotating heat pipe. I. M.G.Semena, Yu.A.Khmelev (Kiev Polytech. Inst., Kiev, Ukrainian SSR).
J. Eng. Phys. (USA), vol.43, no.5, p.1235-42 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.5, p.766-74 (Nov. 1982). [received: Sept. 1983]
The article presents the results of the analytical and experimental investigation of the hydrodynamics of a liquid in a horizontal rotating heat pipe. A formula is derived for determining the thickness of the layer of liquid entrained from the groove of the inner cylindrical surface. (9 refs.)

107252 Investigation of the hydrodynamic regimes of a liquid in a smooth-walled rotating heat pipe. II. M.G.Semena, Yu.A.Khmelev (Kiev Polytech. Inst., Kiev, Ukrainian SSR).
J. Eng. Phys. (USA), vol.44, no.1, p.4-9 (Jan. 1983). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.44, no.1, p.8-14 (Jan. 1983). [received: Sept. 1983]
Deals with the analytical and experimental investigation of the influence of the slope of a rotating heat pipe and of the taper of its inner surface on the hydrodynamics of a liquid. (2 refs.)

107253 Heat transfer to turbulent stream in pipes under supercritical pressures. N.L.Kafengauz (G.M. Krzhizhanovskii Sci.-Res. Inst. of Power Engng., Moscow, USSR).
J. Eng. Phys. (USA), vol.44, no.1, p.9-12 (Jan. 1983). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.44, no.1, p.14-19 (Jan. 1983). [received: Sept. 1983]
Experimental results are presented on heat transfer to several liquid hydrocarbons under supercritical pressures and pseudoboiling conditions. An empirical relation is proposed which generalizes these results. (12 refs.)

107254 Streaming current in stainless steel and nickel pipes for heptane and hexane flows. G.Touchard, P.Dumargue (Lab. de Phys. et Mecanique des Fluides, Univ. de Poitiers, Poitiers, France).
J. Electrostat. (Netherlands), vol.14, no.2, p.209-23 (Aug. 1983).
Important studies have already been made on charge generation; however, because of the difficulties in obtaining reproducible experimental results, and also because of the very complicated theoretical analysis due to the great number of parameters involved, the phenomenon is not yet very well understood. The work described is a new contribution towards a better understanding of these phenomena. The experimental results obtained demonstrate the influence of several non-dimensional parameters. The agreement between experiment and theory is generally good. It seems that one of the most important parameters is the space charge density at the inner wall of the tube, which is due to local electrochemical reaction. In future studies, it seems important to analyse the mechanism of adsorption between the metal and the dielectric liquid in order to help the control of charge generation. (15 refs.)

107255 Stability of the flow during sedimentation in inclined channels. E.Herbolzheimer (Dept. of Chem. Engng., California Inst. of Technol., Pasadena, CA, USA).
Phys. Fluids (USA), vol.26, no.8, p.2043-54 (Aug. 1983).
The conditions for wave formation and growth during sedimentation in inclined channels is investigated using a linear stability analysis in the limit of large sedimentation Grashof number with the Reynolds number remaining *O*.

An asymptotic solution for long waves reveals that the critical Reynolds number is proportional to the tangent of the angle of inclination of the channel times the ratio of the thickness of the thin pure-fluid layer, which forms beneath the downward-facing surface of the channel, to the width of the channel. Hence, the critical Reynolds number is very small unless the channel is extremely long and narrow. Numerical calculations indicate, however, that the maximum amplification rates are often so small that the disturbances may be convected out of the channel before they reach an observable size. This conclusion is consistent with experiments performed in the laboratory, and the observed wave inception point and the calculated maximum amplification rates exhibit remarkably similar dependence on the angle of inclination and the suspension concentration. (20 refs.)

107256 Wave formation and growth during sedimentation in narrow tilted channels. R.H.Davis, E.Herbolzheimer, A.Acrivos (Dept. of Chem. Engng., Stanford Univ., Stanford, CA, USA).
Phys. Fluids (USA), vol.26, no.8, p.2055-64 (Aug. 1983).
A linear-stability analysis is performed to investigate in detail the conditions for wave formation and growth during sedimentation in long, narrow channels that are inclined from the vertical. The maximum amplification rates of such waves are predicted by solving the equations governing the instabilities both asymptotically for long-wavelength disturbances and also numerically for disturbances with moderate wavelengths. The general trends set forth by the linear theory are found to be consistent with experimental observations. In particular, it is shown that very tall and narrow vessels not only give the largest enhancement in the settling rate but also significantly increase the stability of inclined settling systems. (15 refs.)

107257 Experimental study of the near wall region of unsteady turbulent flow in two-dimensional duct. J.Tartarin (Lab. d'Etudes Aerodynamiques, Poitiers, France).
Rev. Phys. Appl. (France), vol.18, no.8, p.495-505 (Aug. 1983). In French.
Experimental study in the near wall region of a two-dimensional turbulent flow, with oscillating perturbation, was performed with particular attention focused on the influence of the imposed frequency, when close to the burst frequency. Noticeable changes in the turbulence and velocity periodic fields profiles in the viscous and buffer layers ($y^+ < 25$) led the author to propose an assumption concerning the behaviour of the turbulence in that region. (35 refs.)

107258 Measurement of flow rate through a pipe by external heating. H.Tanaka, T.Fujii.
Rep. Res. Inst. Ind. Sci. Kyushu Univ. (Japan), no.74, p.115-22 (1983). In Japanese.
A conjugate heat transfer problem is numerically solved when a fully developed laminar flow in a pipe is locally heated from the outside of the pipe wall. A transient temperature distribution is presented and a relation of the temperature increase at the heated site with the dimensionless velocity parameter C_u^- and the dimensionless wall thickness ΔR is derived. A flow rate of water through a stainless steel pipe of 1.25 mm i.d. and 1.61 mm o.d. is measured in the range of 0.01 to 10 ml/min., where the size and heat flux of the heater is optimally designed based on the numerical results. The agreement between the theory and experiment is found to be good. (no refs.)

107259 Reference velocity in the definition of friction factor for tube banks with suction. T.Fujii.
Rep. Res. Inst. Ind. Sci. Kyushu Univ. (Japan), no.74, p.123-7 (1983). In Japanese.
Theoretical consideration is given for a reference velocity in the estimation of friction factor from experimental data on pressure losses through tube banks with suction. The reference velocity can be determined for a given distribution of suction rate in the bank and a given functional form of Reynolds number in the friction factor, when total fluid is sucked in the bank. It is recommended from numerical results that an arithmetic mean value of the inlet and exit velocities should be employed as the reference velocity in both Reynolds number and definition equation. This recommendation is valid when the number of tube rows is less than 40% of that necessary for total suction. (3 refs.)

107260 A numerical analysis of flow and heat transfer of air in an in-line tube bank. M.Fujii, T.Fujii, T.Nagata.
Rep. Res. Inst. Ind. Sci. Kyushu Univ. (Japan), no.74, p.135-48 (1983). In Japanese.
Describes a numerical method to predict laminar flow and heat transfer characteristics over the whole region from the inlet to exit of a tube bank. Calculations are performed for an in-line tube bank which is up to five rows deep, having the longitudinal and transverse pitch-diameter ratios of 1.5×1.5, under the conditions of uniform tube wall temperature, $Re = 60$, 120, and 300, and $Pr = 0.7$. The local and average Nusselt numbers, pressure distributions along tube wall and in the flow direction, and friction factor are presented. These features show clearly a developing region at the inlet, a fully developed one in the core part and a wake one at the exit. The average Nusselt number and friction factor agree well with the experimental results. It is found that there exists an analogy between an in-line tube bank and a plane duct in the heat transfer characteristics, when effective flow length and duct height are adequately chosen. 47.65 MAGNETOHYDRODYNAMICS AND ELECTROHYDRODYNAMICS

(for MHD in plasma, see 52.30)

107261 Parametric excitation of electrohydrodynamic surface waves. A.E.M.A.Mohamed (Dept. of Maths., Ain Shams Univ., Cairo, Egypt), N.K.Nayyar.
Arabian J. Sci. & Eng. (GB), vol.8, no.2, p.103-11 (April 1983).
The electrohydrodynamic surface wave propagating through a horizontal interface between two-dielectrics can be amplified by introducing a horizontal periodic electric field. For certain values of the frequency of the field, the system is set into a state of resonance. An expression for the dependence of such subharmonics on the various parameters of the system is obtained. Detailed studies for limiting cases of small and large modulation are introduced. (18 refs.)

107262 MHD flow past a circular cylinder in a channel. J.Zachariah, K.R.Singh (Dept. of Math., Gauhati Univ., Gauhati, India).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2742-50 (Aug. 1983).
Plane slow motion of an incompressible, electrically conducting and viscous fluid past a circular cylinder placed midway between the two parallel walls in a channel in the presence of a uniform magnetic field parallel to the walls is considered; the consideration is restricted to the case when the magnetic diffusivity is large (i.e. when electrical conductivity is small) and investigation is carried out by considering outer and inner solutions on the basis of Stokes approximation. The drag force on the cylinder is also derived. It is found that the walls have significant effect on the drag force.

107263 A two-dimensional MHD flow of an inviscid fluid past an elliptic cylinder. J.Zachariah, K.R.Singh (Dept. of Math., Gauhati Univ., Gauhati, India).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2751-60 (Aug. 1983).
A steady two-dimensional MHD flow of an incompressible, inviscid, electrically conducting fluid past an elliptic cylinder (of small eccentricity) is considered for the aligned field case when the magnetic diffusivity (η_m) is large. Attempt is made to find the interaction of the field and the motion, and also the drag force experienced by the cylinder by retaining the non-linear terms. It is found, to a first approximation, that the drag force is independent of the fluid density; the drag force for a circular cylinder is also deduced.

107264 Electrohydrodynamic droplet generators. J.M.Crowley (Dept. of Electrical Engng., Univ. of Illinois, Urbana, IL, USA).
J. Electrostat. (Netherlands), vol.14, no.2, p.121-34 (Aug. 1983).
In an electrohydrodynamic (EHD) droplet generator, an electric field acts directly on the surface of an electrically conducting jet after it has been formed and ejected from the nozzle. If the electric field has the proper frequency, it will induce compression and expansion of the jet, which will eventually break up into droplets some distance downstream. In contrast to acoustic droplet generators, the initial disturbance is physically separated from the nozzle, so that the exciter and nozzle can be individually designed to perform their separate tasks efficiently. This paper presents a theory of EHD exciters which predicts the breakup length of the jet in terms of the geometry and physical properties of the printer. Experiments confirm this theory, and show that practical exciters can be designed from first principles with the expectation that the breakup length will be close to that predicted, and insensitive to changes in operating frequency. (11 refs.)

107265 Unsteady hydromagnetic boundary layers on an infinite flat plate in the presence of a transverse magnetic field. R.P.Pathak (St. Xavier's Coll., Ranchi, India), R.C.Choudhary.
Rev. Roum. Phys. (Rumania), vol.28, no.5, p.405-12 (1983).
The momentum integral and the kinetic energy integral equations and the wall compatibility conditions have been derived in dimensionless forms and they are used to study the boundary layer formation on an impulsively started and on a uniformly accelerated infinite flat plate in the presence of a transverse magnetic field. It is observed that the time to reach the steady state pattern decreases with the increase in the strength of the magnetic field. (6 refs.)

107266 Calorimetric investigation of electrohydrodynamic instabilities in liquid crystals. I.A.Kleinman, S.A.Kozlovskii, G.R.Allakhverdov (All-Union Sci. Res. Inst. of Chem. Reagents & Very Pure Chem. Substances, USSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.105-6 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.183-4 (Jan.-Feb. 1983). [received: Sept. 1983]
As the object of their investigation the authors chose the well-researched liquid-crystal compound p-methoxybenzylidene-p′-butylaniline (MBBA) doped with tetrabutylammonium bromide. They prepared two identical cells with

planar-oriented layers of MBBA 20 μ thick. On both specimens they made preliminary microscopic observations and measured the volt-ampere and volt-contrast characteristics. Both specimens were placed in the calorimeter cell which was at room temperature and connected in a differential circuit. To one of the specimens the authors supplied a voltage from a stabilized source, while the other acted as a control. For various voltages U they obtained the dependences of the emitted heat power P vs. the time τ. (7 refs.)

107267 On stability of longitudinal electric current in a viscous liquid cylinder within the longitudinal magnetic field. A.G.Dmitrenko, A.I.Fesenko.
Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1185-91 (Aug. 1983). In Russian.
Stability of small kink magnetohydrodynamic oscillations of a cylinder of incompressible conducting viscous liquid is considered in the paper for crossed magnetic fields. The type of bifurcation was established in transition from stable to labile state. (9 refs.)

47.70 REACTIVE, RADIATIVE, OR NONEQUILIBRIUM FLOWS

107268 Mixing of chemically reactive fluids by swirling in a tubular reactor. J.-J.Ou, Chu-Shu Lee, Shaw-Horng Chen (Dept. of Chem. Engng., Univ. of Rochester, Rochester, NY, USA).
Chem. Eng. Sci. (GB), vol.38, no.8, p.1323-9 (1983).
To achieve a varying degree of radial mixing in a single phase fluid, a stable laminar swirl is created by two fluid streams tangentially entering a tubular reactor. The details of the resultant fluid motion is described using the material stretching coordinate technique. The combination of fluid motion, molecular diffusion, and intrinsic chemical kinetics provides the basis for investigating mixing with chemical reactions for nonpremixed feeds. Computations on an infinitely fast second-order reaction for the radial Peclet number ranging from 10^2 to 10^6 reveal features for the flow-induced swirling in a tubular reactor. (13 refs.)

107269 Effect of vapor efflux from a spherical particle on heat transfer from a hot gas. P.A.Kalson (Dept. of Chem. Engng., Univ. of Michigan, Ann Arbor, MI, USA).
Ind. & Eng. Chem., Fundam. (USA), vol.22, no.3, p.355-7 (Aug. 1983).
The efflux of vapor from a particle reduces the heat transfer to the particle. This effect was evaluated for spherical and elongated (cylindrical) particles. One example of this phenomenon is the devolatilization of small coal particles, for which previous investigators have used the Ackermann correction which was derived for flat-plate geometry. Computation shows that for the case of 74-μm coal particles in an entrained-flow gasifier, the flat-plate solution yields significantly greater values for this effect, and hence significantly lower rates of heat transfer, than the spherical-geometry solution. (5 refs.)

107270 Regularities of the propagation of the standing countercurrent wave of an exothermal reaction in forced filtration of an oxidizing gas through porous material. O.S.Rabinovich, I.G.Gurevich (Lykov Inst. of Heat & Mass Transfer, Acad. of Sci., Minsk, Belorussian SSR).
J. Eng. Phys. (USA), vol.44, no.1, p.62-7 (Jan. 1983). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.44, no.1, p.75-80 (Jan. 1983). [received: Sept. 1983]
Presents a numerical simulation of the countercurrent wave of an exothermal reaction and the dependences of its characteristics on the 'input' parameters of the system. (4 refs.)

107271 The dispersion of a reactive species (atomic hydrogen) in a flowing gas. T.Boddington, A.A.Clifford (Dept. of Phys. Chem., Univ. of Leeds, Leeds, England).
Proc. R. Soc. London Ser. A (GB), vol.389, no.1796, p.179-96 (8 Sept. 1983).
Recent studies of the dispersion of hydrogen atoms in a flowing gas have necessitated the solution of the differential equation governing the dispersion of a very reactive species in a medium flowing along a uniform circular tube with appropriate boundary conditions. The treatment takes into account irreversible loss of the reactive species by reaction on the tube wall and also their reversible adsorption and desorption at the wall. It is also shown how first-order reaction in the moving medium, 'slip' of the boundary layer, and a pressure drop along the tube can be taken into account. (13 refs.)

47.80 INSTRUMENTATION FOR FLUID DYNAMICS

107272 Proposal for the measuring molecular velocity vector with single-pulse coherent Raman spectroscopy. C.Y.She (Phys. Dept., Colorado State Univ., Fort Collins, CO, USA).
Appl. Phys. B (Germany), vol.B32, no.1, p.49-52 (Sept. 1983).
Methods for simultaneous measurements of more than one flow velocity component using coherent Raman spectroscopy are proposed. It is demonstrated that using a kilowatt broad-band probe pulse (3-30 GHz) along with a megawatt narrow-band pump pulse (~100 MHz), coherent Raman signal resulting from a single laser pulse is sufficient to produce a high-resolution Raman spectrum for a velocity measurement. (17 refs.)

107273 Physical modelling of multi-phase flow.
Control & Instrum. (GB), vol.15, no.7, p.37, 39, 41, 43, 45 (July 1983).
Forms a progress report on measurements using turbine, vortex and electromagnetic flowmeters in a vertical upward water flow with small amounts (up to 14% by volume) of air entrained. The results are given as errors in volumetric flow rate. The aim is to establish an envelope bounding the likely errors due to two-phase flow and for this reason, rather than a long upstream settling length, two perforated plates have been used to vary the flow pattern and air distribution. The rig is described and the behaviour of each flowmeter is dealt with in turn. (9 refs.)

107274 Cross-correlation helps to solve the hard ones.
Control & Instrum. (GB), vol.15, no.7, p.47, 49 (July 1983).
The multichannel correlation flowmeter described can prove beneficial when it is hard or impossible to meter accurately. (no refs.)

107275 The many benefits of ultrasonic flowmeters. D.Gerrard.
Control & Instrum. (GB), vol.15, no.7, p.51, 53 (July 1983).
Characteristics, advantages and disadvantages of 'Doppler shift' and 'time of flight' types of ultrasonic flowmeters are introduced. (no refs.)

107276 A lithium sulfate pulse-pressure transducer in a gasdynamic experiment. M.K.Berezkina, I.V.Plotnikov.
Combust. Explos. & Shock Waves (USA), vol.18, no.6, p.666-70 (Nov.-Dec. 1982). Translation of: *Fiz. Goreniya & Vzryva (USSR)*, vol.18, no.6, p.63-8 (Nov.-Dec. 1982).
Results with three gasdynamic processes show that a built-in transducer (for measuring pulse pressures in shock tubes), made of lithium sulfate has adequate sensitivity, low dynamic error, high time resolution, high natural frequency, and stable characteristics, while it introduces no perturbations in the flow. (8 refs.)

107277 Calibration of rolling ball viscometer in the intermediate Reynolds number region. M.A.Hasan (Karachi Labs., Pakistan Council of Sci. & Industrial Res., Karachi, Pakistan).
Can. J. Chem. Eng. (Canada), vol.61, no.4, p.607-11 (Aug. 1983).
The applicability of proposed correlations for the calibration of a rolling ball viscometer in the intermediate Reynolds number region ($0.3<Re\leq 1000$) has been studied. The constants for the equation correlating ball roll time with viscosity have been derived and compared with their experimental values. The dependency of these constants on temperature and on the dimensions of the viscometer has also been described which may help in the optimal design of a rolling ball viscometer. (15 refs.)

107278 Analysis of ultrasonic correlation flowmeters for pulp suspension. J.S.Tornberg, M.Karras, E.M.Harkonen, O.Hirsimaki (Dept. of Electrical Engng., Univ. of Oulu, Oulu, Finland).
IEEE Trans. Sonics & Ultrason. (USA), vol.SU-30, no.4, p.264-9 (July 1983).
A transit time flow measurement system using ultrasonics and cross correlation is studied and constructed for use in the pulp and paper industry. The primary signals are produced by the modulation action of suspension particles on the intensity of two ultrasonic beams. Both continuous and pulsed intensities are used. The signals may be received either as attenuated beams penetrating the tube or as echoes scattered from the backwall. The intensity of the Doppler-shifted frequency of the scattered ultrasound is also used as a primary signal in order to avoid the ringing of the transmitted frequency within the crystal and pipe wall. The radial flow profile, the nature of the correlation method and the frequency filtering of the primary signals make the correlation function asymmetric and cause measurement errors. The system has been used for the measurement of pulp suspension in various cases, and some results are presented. (14 refs.)

107279 Instrument for automatic determination of the direction of the velocity vector of a moving medium. P.I.Savostenko, V.I.Tumanov (Donets State Univ., Donets, Ukrainian SSR).
Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1527-30 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.190-3 (Nov.-Dec. 1982).
This instrument for automatic determination of the azimuthal velocity vector of a moving gaseous or liquid medium has been built on the basis of an F-210 digital voltmeter and a B3-19M calculator. The sensor is a split film sensor with hot wire anemometers. The maximum absolute directional error is $\leq 5°$ for angles in the range 0-360° and velocities in the range 1-20 m/sec with the velocity vector deviating no more than 10° from the horizontal. The rate at which the direction is indicated is no less than 1 count in 4-5 sec and may vary. (6 refs.)

107280 A Couette cell with fixed stator alignment for the measurement of flow modified permittivity and electroviscosity. H.Block, E.M.Gregson, A.Qin, G.Tsangaris, S.M.Walker (Inorganic, Phys. & Industrial Chem. Dept., Univ. of Liverpool, Liverpool, England).
J. Phys. E (GB), vol.16, no.9, p.896-902 (Sept. 1983).
The design features required for the construction of a Couette shear cell with fixed stator-rotor alignment to measure the permittivity of liquids in flow is discussed. Details of the construction of such a cell having the capability of measuring permittivities of liquids from rest to flow rate $\lesssim 10^5$ s^{-1}, and also of measuring viscosity are presented. The provision of both macro- and micro-measuring electrodes enables the equipment to be used for low- and high-permittivity liquids including aqueous systems, at selected and well controlled temperatures. (8 refs.)

107281 On the force fluctuations acting on a circular cylinder in crossflow from subcritical up to transcritical Reynolds numbers. G.Schewe (DFVLR-Inst. fur Aeroelastik, Gottingen, Germany).
J. Fluid Mech. (GB), vol.133, p.265-85 (Aug. 1983).
Force measurements were conducted in a pressurized wind tunnel from subcritical up to transcritical Reynolds numbers $2.3\times 10^4 \leq Re \leq 7.1\times 10^6$ without changing the experimental arrangement. The steady and unsteady forces were measured by means of a piezobalance, which features a high natural frequency, low interferences and a large dynamic range. In the critical Reynolds-number range, two discontinuous transitions were observed, which can be interpreted as bifurcations at two critical Reynolds numbers. In both cases, these transitions are accompanied by critical fluctuations, symmetry breaking (the occurrence of a steady lift) and hysteresis. In addition, both transitions were coupled with a drop of the C_D value and a jump of the Strouhal number. Similar phenomena were observed in the upper transitional region between the super- and the transcritical Reynolds-number ranges. The transcritical range begins at about $Re \approx 5\times 10^6$, where a narrow-band spectrum is formed with $Sr(Re=7.1\times 10^6)=0.29$. (17 refs.)

107282 Particle-sampling statistics in laser anemometers: sample-and-hold systems and saturable systems. R.V.Edwards (Chem. Engng. Dept., Case Western Reserve Univ., Cleveland, OH, USA), A.S.Jensen.
J. Fluid Mech. (GB), vol.133, p.397-411 (Aug. 1983).
The output statistics of a laser anemometer operating in a low particle density are discussed. A rigorous derivation is given for the influence of two popular

data-handling algorithms on these statistics. In particular it is shown that the measured statistics can differ from those of the flow statistics and from the particle-arrival statistics. The variables that control the statistical regime are derived and quantitative estimates are given for their ranges of influence. The first system discussed is a sample-and-hold system where the output is a piecewise-continuous signal obtained by holding the last processor measurement until a new one is obtained. The second system is one where an attempt is made to store all the measurements for processing, but which contains a rate-limiting device. Because of this device, some measurements may be lost when the particle rate is high. This system is referred to as a saturable system. (13 refs.)

107283 Measurement of unsteady gas flow under anisothermic conditions. L.V.Gulin, V.F.Shipitsin, P.V.Volobuev (Sverdlovsk Engng. Pedagogical Inst., Sverdlovsk, USSR).
J. Eng. Phys. (USA), vol.44, no.1, p.59-61 (Jan. 1983). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.44, no.1, p.71-4 (Jan. 1983). [received: Sept. 1983]
The authors describe a dynamic method for measuring unsteady gas flow under anisothermic conditions. They show that the value of the flow sensitivity determined under isothermal conditions can be used for molecular flow. (3 refs.)

107284 Calibration of hot-wire probes and determination of their directional sensitivity by numerical methods. L.Paulsen (Daimler-Benz AG, Stuttgart, Germany).
Mess. & Pruef. (Germany), vol.19, no.6, p.342-5 (June 1983). In German.
A method is described whereby the calibration curve of a hot-wire sensor is approximated numerically by polynomial functions. It is shown that five parameters are needed to describe the directional sensitivity of the probe, and a method is suggested to determine these parameters from measurements in a flow of known velocity at five different positions of the probe. The method is particularly suitable and convenient to use in conjunction with online computer processing. (7 refs.) *S.R.*

107285 Effect of wall scattering on SNR in off-axis differential-type laser Doppler velocimetry. H.Mishina (Dept. of Imaging Sci. & Technol., Chiba Univ., Chiba-shi, Japan), K.Takahashi, T.Asakura.
Opt. & Quantum Electron. (GB), vol.15, no.5, p.419-31 (Sept. 1983).
Though various properties and applications of laser Doppler velocimetry have been extensively studied in the past decade, there is little discussion on the effect of light scattering from the surface of a cell on Doppler beat signals or on methods of reducing it. In this paper, the effect of light scattering from the surface of the cell is treated as a background noise and is studied theoretically and experimentally on the detecting process of Doppler beat signals in off-axis differential-type laser Doppler velocimetry. Laser Doppler velocimetry of an off-axis type is verified to be effective for measurement of the flow velocity in the vicinity of a scattering wall. The effect of the light scattered from the wall surface on the signal-to-noise ratio (SNR) of Doppler beat signals is discussed in detail. The minimum distance, which is close to the wall and at which good Doppler beat signals can be obtained, is defined and determined quantitatively. This minimum distance is found to be strongly affected by the off-axis angle of the detecting optical system. (5 refs.)

107286 Laser-induced fluorescence technique for velocity field measurements in subsonic gas flows. B.Hiller, J.C.McDaniel, E.C.Rea,Jr., R.K.Hanson (Dept. of Mech. Engng., Stanford Univ., Stanford, CA, USA).
Opt. Lett. (USA), vol.8, no.9, p.474-6 (Sept. 1983).
A nonintrusive optical technique is reported for multiple-point velocity measurements in subsonic flows. The technique is based on the detection of fluorescence from a Doppler-shifted absorption line of seeded iodine molecules excited at a laser frequency fixed in the wing of the line. Counterpropagating laser sheets are used to illuminate the flow, in the present case a nitrogen round jet, thereby eliminating the need for an unshifted reference signal. The fluorescence is detected simultaneously at 10000 points in a plane of the flow using a 100×100 element photodiode-array camera. The velocity at each point is computed from four successive camera frames, each recorded with a different beam direction. The measured mean velocities between 5 and 50 m/sec agree well with data from the literature. (8 refs.)

107287 Laser-2-focus velocimeter and wall scattering. H.Hayami, H.Ueki, H.Higashimori, Y.Senoo.
Rep. Res. Inst. Ind. Sci. Kyushu Univ. (Japan), no.74, p.159-66 (1983). In Japanese.
It is demonstrated by Schodl (1977) that a laser-2-focus velocimeter (L2FV) with high S/N ratio is of great advantage to make measurements of the magnitude and direction of flow in a rotating impeller. In the case of a narrow passage of the centrifugal impeller however, the S/N ratio deteriorates for measurement near walls owing to light scattering. A L2FV is developed and the measurement of velocity distribution is pursued in a narrow passage, similar to that of centrifugal impeller, and some attempts are made to reduce the unmeasurable zone near the walls due to strong scattering. (7 refs.)

107288 On automatic measurements of very low sedimentation velocity. H.Ueki, H.Hayami.
Rep. Res. Inst. Ind. Sci. Kyushu Univ. (Japan), no.74, p.249-54 (1983). In Japanese.
An automatic measuring system using a laser Doppler velocimeter is developed, in order to make measurements of very low sedimentation velocity of seeding particles for laser velocimetry. The details of the system are presented. Furthermore, the sedimentation velocities of seeding particles of SiO_2 with individual particle diameter of $0.04\ \mu m$, which are agglomerated to form flocks of about $2\ \mu m$ in mean diameter, are measured, and fidelity of the motion of particles to flow is discussed. (5 refs.)

107289 New developments in magnetic flow measurement in partly filled open channels. K.W.Bonfig (Inst. fur Messtech., Univ. GH Siegen, Siegen, Germany).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.61-70 vol.2
To measure flow in open channels it is necessary to know both the velocity of flow and the cross-section of the fluid. The volumetric flowrate is gained by multiplying an electrical signal proportional to the filled cross-section with an electrical signal proportional to the mean velocity of the fluid. In the concept described the signal proportional to the mean velocity of the fluid is obtained by magnetic flow measurement by means of a keyed DC-field. The signal proportional to the cross-section which is filled by the fluid is gained by using a circuit consisting of conducting wires, electrodes and the surface of the conducting fluid. Because of the rate of change of the magnetic field, which penetrates this circuit, a voltage is induced in this circuit which is proportional to the area and to the strength of this field. (12 refs.)

107290 Possibilities of improving the accuracy of electromagnetic flowmeters through the influence of geometrical parameters and field configuration. I.D.Velt, Yu.V.Mikhailova (Sci. Res. Inst. of Thermal Power Instrument Construction, Moscow, USSR).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.71-8 vol.2
The influence of insulated layer on the electromagnetic flowmeter output signal has been studied. This influence is simply described by means of a flowmeter weight function. The calculation is easily accomplished in two cases, when the insulated layer length is small compared to the flowmeter diameter. In a general case the problem is reduced to integral equation solution. It has been obtained by means of the perturbation theory. (1 ref.)

107291 A vortex ring shedding flowmeter. M.Takamoto, K.Komiya (Nat. Res. Lab. of Metrology, Ibaraki, Japan).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.87-96 vol.2
The vortex shedding from a ring was studied. A remarkably regular sinusoidal velocity fluctuation was detected at the center of the wake behind the ring, and a stable vortex ring shedding from the ring was recognized through flow visualization. A flowmeter and a velocimeter applying the vortex ring shedding phenomenon were developed which can be used for measuring a turbulent pipe flow and a low velocity flow, respectively. (90 refs.)

107292 Momentum type flowmeter. Improvement in dynamic characteristics. K.Yamamoto, A.Nomoto (Faculty of Engng., Tokyo Agricultural & Technol. Univ., Tokyo, Japan).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.97-106 vol.2
The momentum type flowmeter consisting of two flexibly supported U-tubes features simple construction without any elements within a conduit. The system is nonlinear and of the second-order type. For improving the dynamic characteristics, the static pressure is detected directly by means of a semiconductor transducer instead of a pressure sensing U-tube system. Deviation in transient response can this be reduced and settling time decreased to less than 0.1 sec. (2 refs.)

107293 The influence of flow distortion on the accuracy of non-intrusive flowmeters. A.Lauber (Dept. of Phys. & Measurement Technol., Linkoping Inst. of Technol., Linkoping, Sweden).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.107-11 vol.2
Analyses the influence of flow distortion on the measuring accuracy of non-intrusive flowmeters of the inductive, acoustic (time-of-flight and Doppler) and correlation types. In a fully developed flow, inductive flowmeters will always measure correct total flow, while acoustic time-of-flight flowmeters may be designed to exhibit an error $<1\%$ under similar conditions. When exposed to distorted flow, all now available types of non-intrusive flowmeters may exhibit sizeable errors. (17 refs.)

107294 A novel fluid flow measuring device employing pn-heat pulses. W.Witte, P.W.Baier (Fachbereich Elektrontech., Univ. Kaiserslautern, Kaiserslautern, Germany).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.159-67 vol.2
Deals with the volume flow measurement of laminar fluid flows based on a transit time measurement of tagged fluid particles by correlation. The tagging is done by means of low-intensity heat pulses constituting a binary pseudo-noise sequence (pn-seuenc) independent of the temperature of the flow medium. (5 refs.)

107295 Velocity measurements of non-steady one-phase flows by correlation techniques. C.Koppermann (Inst. fur Mess- und Regelungstech., Univ. Karlsruhe, Karlsruhe, Germany).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.169-76 vol.2
Application of cross-correlation methods to one-phase flows is possible only if suitable statistical signals can be detected. An optical sensor is described which uses the variations of the refractive index occurring especially in mixtures of hydrocarbons. Because of the high bandwidth of the sensor signals and the small transit-times a very fast measurement results. Using a closed-loop tracking correlator the sensor system is qualified to measure non-steady flows in a high measurement range. (5 refs.)

107296 Transit time measurement of density fluctuations for the determination of the mean flow velocity in dense-phase fluidized conveying channels. H.P.Greiner (Inst. fur Prozessmesstech., Univ. Karlsruhe, Karlsruhe, Germany).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.177-86 vol.2
Describes a new injection method for the determination of the mean velocity of flow of bulk materials in dense-phase fluidized conveying channels. The transit time of specially generated air pulses is analyzed. The density fluctuations are measured with new capacitive sensors. A mathematical model is developed, which describes the behavior of the density fluctuations in the fluidized mass flow. The injection method is used for the continuous mass flow measurement in dense-phase fluidized conveying channels. (5 refs.)

107297 Capacitive sensors for solids flow measurement by correlation methods. G.Schneider, W.Bernard, F.Mesch (Inst. fur Mess- und Regelungstech., Univ. Karlsruhe, Karlruhe, Germany).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.187-93 vol.2
Describes robust transducers which are well suited for solids flow measurement by correlation techniques. They consist of a capacitive sensor having a high degree of interference immunity and a low frequency measurement bridge. The development started with a transformer-ratio-arm bridge from which a transformer-free bridge was derived. Capacity changes of 10^{-15}F were resolved with good reproducibility. By applying these transducers to the

velocity measurement of solids in a pneumatic conveyor, very good cross-correlation was obtained. (5 refs.)

107298 Sources of error and their minimisation in ultrasonic cross correlation flowmeters. J.Coulthard, R.P.Keech, S.T.Olszowski (Dept. of Mech. Engng., Teesside Polytech., Middlesbrough, England).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.195-204 vol.2
Ultrasonic cross correlation flowmeters offer an attractive alternative to magnetic flowmeters in two-phase flow applications and in pipe diameters above 300 mm. Experience in applying prototype flowmeters to industrial flow situations revealed three main sources of error arising from ultrasonic design, correlator design and fluid flow properties. The nature of these errors and their minimisation are described. (7 refs.)

107299 Systematic errors in cross-correlation velocity measurements. R.Rell (School of Control Engng., Univ. of Bradford, Bradford, England).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.205-14 vol.2
Space-time intensity correlations are derived for a frozen tracer pattern and a simple, nonfrozen pattern formed by tracer particles with independent, random velocities. The transit time correlation function used in velocity measurement is shown to be the convolution of this pattern intensity correlation with a velocimeter response function describing the spatial and temporal filtering performed by the velocimeter sensors. Effects of pattern and velocimeter parameters on the apparent pattern velocity are investigated. Systematic errors exceeding 20% are possible in uncalibrated measurements while errors of 10% can occur, even after calibration, because of changes in the trace pattern. (3 refs.)

107300 Vortex signal analysis. H.Ihalainen, J.Halttunen (Measurement Engng., Tampere Univ. of Technol., Tampere, Finland).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.215-20 vol.2
Describes the features of the vortex indication signal of the vortex flowmeter. As a result of the analysis settling time of the meter is estimated. The unequally spaced sampling of the frequency signal is applied to the analysis. (no refs.)

107301 Measurement of non-stationary fluid parameters by Kalman-filters. T.Weber (Inst. fur Mess- und Regelungstech., Univ. Karlsruhe, Karlsruhe, Germany).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.221-9 vol.2
Measurement of non-stationary fluids is considered. Well known sensor-configurations are used for dynamic measurements with the aid of modern signal processing methods which were developed to estimate dynamic parameters. The methods described are compared with those used previously. (7 refs.)

107302 Measuring the velocity distribution of particles dispersed in a flow by an ultrasonic Doppler anemometer. H.Braun (Inst. fur Mess- und Regelungstech., Univ. Karlsruhe, Karlsruhe, Germany).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.231-40 vol.2
Presents theoretical and experimental investigations of ultrasonic Doppler anemometry. The spatial character of the considered phenomenon is discussed. It is shown that the power spectrum of Doppler signals and the velocity distribution of the particles are closely related. On account of good experimental results, the usefulness of this method, especially for measurements in chemical reactors, can be expected. (9 refs.)

107303 A computer controlled laser-Doppler anemometer for flow rate measurement. G.Taux (Phys.-Tech. Bundesanstalt, Braunschweig, Germany).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.241-9 vol.2
Describes a new flow test rig at the PTB for precise flow rate measurements. The fundamental principles of the laser Doppler anemometry (LDA) are given and a specially designed two-colour LDA is described which allows one to measure two orthogonal velocity components in a nozzle flow. The LDA system is mounted on a three dimensional NC-controlled (XYZ) traverse. The electronic data processing systems consist of two transient recorders, computer controlled variable bandpass filters and a digital computer for the final digital data evaluation of the flow velocity. (4 refs.)

107304 The LADO-II laser Doppler anemometer. Design and application. N.Feistauer (Jenoptik Jena GmbH, Jena, Germany), H.E.Albrecht.
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.251-6 vol.2
The state of laser Doppler anemometry (LDA) in the CMEA, represented by the LADO-II system, a joint development with the Siberian Branch of the Soviet Academy of Sciences, is described. The authors briefly outline the field of LDA applications, describe the concept and design of the LADO-II system, and report on three different applications illustrating the system's flexibility of use. (12 refs.)

107305 Measurement of instantaneous flow rate through estimation of velocity profiles. M.Uchiyama, K.Hakomori (Dept. of Precision Engng., Tohoku Univ., Sendai, Japan).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.261-70 vol.2
Describes a new method to measure the instantaneous flow rate of unsteady flows in a circular pipe by estimating the velocity profiles of the flows. The estimation problem is formulated as a discrete Kalman filter problem after the dynamics of the velocity profile variation is approximated by a finite-dimensional model. An instantaneous flowmeter consisting of a laser Doppler velocimeter and an eight-bit microcomputer which implements the solution has been successfully developed. (6 refs.)

107306 A non-invasive flowmeter based on electrical conductivity measurements. A.Longoni, C.Bussolati, G.Franceschini (Lab. di Elettronica, Politecnico di Milano Sezione di Brescia, Brescia, Italy).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.271-7 vol.2
A non-invasive flowmeter based on measurements of the random fluctuations of the conductivity of the moving fluid is described. A new circuit capable of detecting fluctuation of the order of 10^{-4} of the mean value has been developed. The circuit can be described as a 'lock-in' amplifier with a feedback loop in which the output signal, suitably averaged, is synchronously modulated and subtracted from the input signal. The fluid velocity is evaluated by using cross-correlation techniques. (5 refs.)

107307 Ultrasonic measurement of volume flow independent of velocity distribution. H.Lechner (Landis & Gyr AG, Zug, Switzerland).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.279-88 vol.2
In ultrasonic flow metering based on transit time differentials, pairs of acoustic signals are simultaneously exchanged between two locations in a measuring tube, arranged so that one signal travels upstream and the other downstream. The propagation times of the two signals are different and the difference can be used as a measure of the flow. It is shown that a very accurate measurement of the total flow rate, independent of the flow's profile, can be achieved when the tube is utilized as an acoustic waveguide, provided plane waves are excited. 47.90 OTHER TOPICS IN FLUID DYNAMICS

107308 Slow viscous flow around an inclined fence on a plane. Jae-Tack Jeong (Dept. of Mech. Engng., Korea Advanced Inst. of Sci. & Technol., Seoul, Korea), Moon-Uhn Kim.
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2356-63 (July 1983).
Two-dimensional slow viscous flow around an inclined fence on an infinite plane is investigated on the basis of the Stokes approximation. A formal expression for the flow is obtained by solving a pair of simultaneous Wiener-Hopf equations. The force and moment exerted on the fence are calculated and features of the flow are discussed. (7 refs.)

51.00 KINETIC AND TRANSPORT THEORY OF FLUIDS; PHYSICAL PROPERTIES OF GASES

51.10 KINETIC AND TRANSPORT THEORY

107309 Dynamic equation of state of a gas containing vaporizing droplets. G.P.Yasnikov, V.S.Belousov (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR).
J. Eng. Phys. (USA), vol.43, no.5, p.1207-12 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.5, p.733-40 (Nov. 1982). [received: Sept. 1983]
On the basis of the relaxational formalism of nonequilibrium thermodynamics, a differential equation is obtained relating the pressure and volume of a gas containing vaporizing droplets. The relaxation time is calculated. (13 refs.)

107310 Constructing a single equation of state for gas and liquid by the method of minimizing the sum of squares of the relative deviations. B.A.Grigor'ev, S.A.Plotnikov, D.S.Kurumov (M.D. Millionshchikov Grozny Petroleum Inst., USSR).
J. Eng. Phys. (USA), vol.44, no.1, p.96-9 (Jan. 1983). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.44, no.1, p.114-18 (Jan. 1983). [received: Sept. 1983]
The use of the sum of squares of the relative deviations as the minimization criterion in the scheme of the least-squares method is proposed for the construction of a single thermal equation of state. (6 refs.)

107311 Self-diffusion of spheres in a concentrated suspension. C.W.J.Beenakker, P.Mazur (Inst.-Lorentz, Rijkskuniv. te Leiden, Leiden, Netherlands).
Physica A (Netherlands), vol.120A, no.1-2, p.388-410 (1983).
The authors calculate the concentration-dependence of the short-time self-diffusion coefficient $\mathbf{D}_s$ for spherical particles in suspension. The analysis is valid up to high densities and fully takes into account the many-body hydrodynamic interactions between an arbitrary number of spheres. The importance of these many-body interactions can be inferred from the calculation of the second virial coefficient of $\mathbf{D}_s$. (26 refs.)

107312 Milne problem for a hard sphere Rayleigh gas: a study based on the Fokker-Planck equation. S.Waldenstrom, K.J.Mork, K.Razi Naqvi (Dept. of Phys., Univ. of Trondheim, Trondheim, Norway).
Phys. Rev. A (USA), vol.28, no.3, p.1659-61 (Sept. 1983).
The Milne problem for a hard-sphere Rayleigh gas is studied by solving the stationary Fokker-Planck equation according to the method of moments; the results, obtained with only a modicum of effort, are in excellent agreement with a recent treatment, based on the Boltzmann equation. The belief that the one-dimensional Fokker-Planck equation is appropriate for solving this problem is not supported by the analysis. (19 refs.)

107313 Self-consistent kinetic theory for the Lorentz gas. E.Leutheusser (Dept. of Nuclear Engng., MIT, Cambridge, MA, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1762-73 (Sept. 1983).
A new kinetic theory for a particle moving in a random array of static spherical scatterers is derived. By decoupling a higher-order dynamical correlation function, a kinetic equation is obtained comprising known approximations like ring, repeated-ring theory, and their self-consistent versions and, in particular, the equivalence of a recent mode-coupling theory and self-consistent ring theory is established. Vertex corrections, as represented by a new class of collision sequences, are shown to be essential for the Lorentz gas. New results for the Burnett coefficient are also presented. (29 refs.)

107314 Topoenergetic aspects of quenching processes of atomic and molecular excited species in rarefied gases. G.Dragan (Inst. of Chem. Res., Bucharest, Rumania).
Rev. Roum. Phys. (Rumania), vol.28, no.5, p.389-403 (1983).
The universal representation (UR) of kinetic data associated to non-equilibrium systems, and established in the framework of the topoenergetic theory of composite systems, is applied to deactivation processes of atomic and molecular excited species in rarefied gas phases. Three distinct cases are considered in which the driven potential is the temperature, concentration and energy level of excited species, respectively, and experimental conditions for which UR can be applied are discussed in detail. For the last case this manner of data representation is strongly argued by the recent exponential scaling law empirically established. The affine parameters resulted according to UR define both the individual behaviour of an excited species-quencher system and a group of excited species and/or quenchers in the framework of a measuring system and this means that UR can define the ontogeny and respectively the phylogeny of the measuring system. 51.20 VISCOSITY AND DIFFUSION: EXPERIMENTAL

107315 Ab initio calculation of transport—orientation-phenomena (Senftleben-Beenakker effects) for HD infinitely dilute in helium. W.E.Kohler (Inst. fur Theoretische Phys., Univ. Erlangen-Nurnberg, Erlangen, Germany), J.Schaefer.
Physica A (Netherlands), vol.120A, no.1-2, p.185-212 (1983).
The effective kinetic cross sections, governing the magnetic field influences (Senftleben-Beenakker effects) on viscosity, heat conductivity, diffusion and thermal diffusion as well as flow birefringence and the collisional broadening of the depolarized Rayleigh line have been evaluated for HD infinitely dilute in He in the temperature range between 20K and 450K. Starting point was a new He-HD anisotropic interaction obtained from the ab initio He-H_2 potential surface of Meyer, Hariharan and Kutzelnigg (1980). The elements of the scattering amplitude matrix needed for the calculation of all effective cross sections have been obtained in close coupled procedures. Rotational levels of HD up to $j=5$ have been taken into account. As far as comparison with experiment is possible, full quantitative agreement is obtained. The inelastic contributions to the cross sections are shown to be mainly due to the strong $P_1(\cos\theta)$-anisotropy in the potential. (31 refs.)

107316 Diffusive separation of binary mixtures of CO_2-H_2 in a sonic-orifice expansion. T.Dwayne McCay (NASA, Marshall Space Flight Center, AL, USA), L.L.Price.
Phys. Fluids (USA), vol.26, no.8, p.2115-19 (Aug. 1983).
The separation of binary gas mixtures of carbon dioxide and hydrogen in sonic-orifice-generated free jets is investigated over a source Reynolds number range of 100 to 3000 using the well-known electron beam fluorescence technique. The lighter species, hydrogen, is chosen as the minor species in order to examine the extent of the validity of Sherman's first-order diffusive separation theory for large separation. The diffusive separation of mixtures containing approximately 2%, 5%, and 20% hydrogen in carbon dioxide is investigated by experimentally determining the relative number densities of the two species as a function of centerline axial distance within the free jets. Sherman's diffusive separation theory is applied to the jets using axial Mach number profiles which were a combination of experimental and analytical results for $\gamma=1.40$ expansions. The $\gamma=1.40$ expansion is shown to approximate the CO_2-H_2 expansion quite well, and the calculated separation agrees remarkably well with the experimentally determined values. (33 refs.)

51.30 THERMAL PROPERTIES OF GASES

107317 A switch function applied to the thermodynamic properties of steam near and not near the critical point. H.W.Woolley (Thermophysics Div., NBS, Washington, DC, USA).
Int. J. Thermophys. (USA), vol.4, no.1, p.51-95 (March 1983).
A study is presented of the still-unsolved problem of estimating thermodynamic property values in a region intermediate between the critical region in which the scaling laws apply, and regions further from critical, where classical behaviour prevails. A procedure has been developed in which a varying weighting function is used in obtaining a weighted 'average' of the scaled and the classical Helmholtz free energy. Other properties are then obtained by differentiation. It is first demonstrated that it is fundamentally impossible for the 'averaged' Helmholtz free energy and its first two derivatives to all be intermediate between the corresponding values from the scaled and the classical formulations. The procedure has been developed and tested for steam. The scaled function is the simple linear model of Murphy et al. (1975), the classical equation that of Pollak (1974, 1976). The properties of power-weighted switch functions, particularly with respect to the behaviour of higher-order derivatives, and the choice of the boundaries of the switching region, were examined in detail and optimized by proper choice of parameters. It is shown that a resonably smooth transfer from the scaled to the classical region can be achieved as far as free energy, energy, and specific heat C_v are concerned. For satisfactory behaviour of all second derivative properties, the two formulations need to be more compatible in the switching region than they are in the present case. (11 refs.)

107318 Thermal conductivity of inert gases over a wide temperature range. A.G.Shashkov, N.A.Nesterov, O.A.Kolenchits (Inst. of Appl. Phys., Acad. of Sci., Minsk, Belorussian SSR).
J. Eng. Phys. (USA), vol.43, no.5, p.1253-60 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.5, p.788-95 (Nov. 1982). [received: Sept. 1983]
Presents the results of correcting and correlating experimental data on the thermal conductivity of inert gases in the temperature range 90-6000K. (84 refs.)

107319 Thermodynamic analysis of the reasons for the difference between the values of the thermal conductivities of gases as measured by steady-state and transient methods. T.N.Abramenko (Appl. Phys. Inst., Acad. of Sci., Belorussian SSR).
J. Eng. Phys. (USA), vol.43, no.5, p.1268-71 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.5, p.804-7 (Nov. 1982). [received: Sept. 1983]
It is shown that the effective thermal conductivities of a gas measured by steady-state and transient methods are not equal. (15 refs.)

107320 An application of a representation theorem for entropy functionals. B.Forte (Dept. of Appl. Math., Univ. of Waterloo, Waterloo, Ontario, Canada), C.C.A.Sastri.
Mol. Phys. (GB), vol.49, no.6, p.1337-40 (20 Aug. 1983).
An attempt is made to answer two apparently unrelated questions. The first question is, under what conditions are the kinetic and thermodynamic derivations of the equation of state of a perfect gas consistent? The second question concerns an expression for entropy derived earlier by the authors (1975, 1977). The expression contains a new term—the continuous analogue of the Hartley entropy—whose coefficient (c) is non-negative. The question is, are there physical systems for which $c>0$? The answer to the first question is affirmative only if $c=0$ and $u\to\infty$, where u is the maximum speed of a molecule in any direction. It is also pointed out that in the case of a non-ideal gas, the presence of a positive c would be necessary for consistency between the kinetic and thermodynamic derivations. (6 refs.)

51.40 ACOUSTICAL PROPERTIES OF GASES; ULTRASONIC RELAXATION

(see also 43. Acoustics; for acoustic properties of liquids, see 62.60; for ultrasonic relaxation in liquids, see 62.80)

107321 Velocity of sound in argon and in helium-argon and nitrogen-carbon dioxide gas mixtures at high pressures. Yu.L.Kachanov, B.E.Kanishchev, L.L.Pitaevskaya (M.V. Lomonosov State Univ., Moscow, USSR).
J. Eng. Phys. (USA), vol.44, no.1, p.1-4 (Jan. 1983). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.44, no.1, p.5-8 (Jan. 1983). [received: Sept. 1983]
The sound velocity is measured in argon and in mixtures of helium with argon and of nitrogen with carbon dioxide at pressures up to 800 MPa and at temperatures in the range 298.16-423.16K. (7 refs.)

107322 Nonlinear tridimensional propagation of acoustic waves in radiative gas dynamics. A.Palumbo (Dipartimento di Matematica, Univ. di Messina, Messina, Italy).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.17, p.588-92 (27 Aug. 1983).
The evolution of nonlinear acoustic waves in radiative gas dynamics is investigated, without assuming any symmetry on the wave surfaces. Such waves, subject to dissipative and nonlinear effects, are asymptotically governed by a Burger-like equation. (9 refs.)

51.50 ELECTRICAL PHENOMENA IN GASES

(see also 52. Plasma and electric discharges)

107323 Electron and ion transport in gaseous methanol and water: density and temperature effects. N.Gee, G.R.Freeman (Dept. of Chem., Univ. of Alberta, Edmonton, Alberta, Canada).
Can. J. Chem. (Canada), vol.61, no.7, p.1664-70 (July 1983).
Electron and cation mobilities in methanol and water vapor measured at $293\leq T$ (K)≤ 617 were used to estimate the corresponding momentum transfer cross sections. The electron cross sections correlate with the square of the dipole moment. The onset of electron quasilocalization in the saturated vapor occurs at $n_{ql}\approx 10^{25}$ molecules/m^3 ($n_{ql}/n_c\approx 0.010$) in methanol and 3×10^{25} ($n_{ql}/n_c\approx 0.003$) in water. The Ioffe-Regel limit for quasifree states gives $n_{ql}\approx 0.36\times(Tn\mu_e)_{ql}$, which holds quite well when the gas molecules are relatively rigid. The density normalized mobility of cations $n\mu_+$ in saturated methanol vapor is constant at 1.02×10^{21} molecules/m V s up to 67×10^{25} molecules/m^3 (25 Amagats). In saturated water vapor $n\mu_+=1.87\times 10^{21}$ molecules/m V s up to 30×10^{25} molecules/m^3 (11 Amagats). (50 refs.)

107324 Molecular shape effect on electron transport in fluids: density and temperature studies in mixtures of *n*-pentane and neopentane. I.Gyorgy, N.Gee, G.R.Freeman (Chem. Dept., Univ. of Alberta, Edmonton, Alberta, Canada).
J. Chem. Phys. (USA), vol.79, no.4, p.2009-17 (15 Aug. 1983).
Electron mobility μ_0 in nonpolar and slightly polar ($D\leq 0.5$ D) hydrocarbon fluids is strongly affected by the external shape of the molecules. The mobility is large in a liquid of spherelike molecules such as neopentane. Addition of rodlike molecules such as *n*-pentane decreases μ_0, but has little effect on the

value of the threshold field for electron heating. A liquid of spherelike molecules forms a conduction band that has relatively small undulations in its lower potential surface. Addition of rodlike molecules provides orientational disorder, anisotropic polarizability, and restricted rotation, which in combination produce potential fluctuations that are durable enough to localized electrons. The maximum in μ_0 that occurs in pure liquid neopentane at 3.5×10^{27} molecule/m^3 progressively decreases in magnitude and shifts to lower densities as *n*-pentane is added; it occurs at the critical density in *n*-pentane. A plot of log μ_0 against mol.% *n*-pentane for liquid mixtures of *n*- and neo-pentane at constant T/T_c is slightly S shaped. A plot of the Arrhenius temperature coefficient E_μ against mole% *n*-pentane is S shaped in the opposite direction. At $T/T_c=0.999$ the log μ_0 plot is not S shape and the slope is much smaller than at $T/T_c\leq0.92$; the molecular shape effect is minimal in the critical fluids and dense gases, $1.0\geq n/n_c\geq0.3$. Quasilocalization occurs to a similar extent in all gases at the same n/n_c and T/T_c. In the low density gases the molecular shape effect is the opposite of that in dense liquids; at electron energies <0.10 eV the spherelike neopentane has a larger scattering cross section than does its nonspherelike isomer *n*-pentane. In an equimolar mixture the stronger scatterer dominates the electron behavior, which means *n*-pentane in the liquid and neopentane in the normal gas. (39 refs.)

107325 Electron mean energy, secondary ionisation coefficients and $(E/p)_{crit}$ in binary mixtures of SF_6-N_2 and CCl_2F_2-N_2. M.C.Siddagangappa, C.S.Lakshminarasimha, M.S.Naidu (Dept. of High Voltage Engng., Indian Inst. of Sci., Bangalore, India).
J. Phys. D (GB), vol.16, no.9, p.1595-601 (14 Sept. 1983).
Measurements of the ratio of diffusion coefficient to mobility (D/μ) of electrons in SF_6-N_2 and CCl_2F_2-N_2 mixtures over the range $80<E/p<200$ (where E is the electric field in V cm^{-1} and p is the pressure in Torr reduced to 20°C) are reported. Values of $(E/p)_{c.mix}$ (the critical E/p of the mixture, where $\alpha=\eta$), and the electron mean energies $\bar{\epsilon}_{c.mix}$ corresponding to $(E/p)_{c.mix}$, are found to vary with the percentage of the electronegative gas in the mixture (F) according to the following relationship: $(E/p)_{c.mix}=(E/p)_{c.N(2)}+[(E/p)_{c.A}-(E/p)_{c.N(2)}]\ [1-\exp(-\beta F/100-F)]$ and $\bar{\epsilon}_{c.mix}=\bar{\epsilon}_{c.N(2)}+(\bar{\epsilon}_{c.A}-\bar{\epsilon}_{c.N(2)})\ [1-\exp(-\beta F/100-F)]$ where A refers to the attaching gas, either SF_6 or CCl_2F_2 and β is a constant, equal to 2.43 for SF_6 mixtures and 5.12 for CCl_2F_2 mixtures. In the present study, it has been possible to show that β is indeed to a factor of synergism. Estimated γ values (secondary ionisation coefficients) did not show any significant variation with F for $F<50$. (25 refs.)

107326 Ion mobilities and clustering in SF_6 at high pressures. J.de Urquijo-Carmona (Inst. de Fisica, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico).
J. Phys. D (GB), vol.16, no.9, p.1603-9 (14 Sept. 1983).
Using a time-resolved technique (uniform field), ion transients in SF_6 at low E/p_{20} (2.5-80 V cm^{-1}Torr^{-1}) and a high gas pressures (70.1, 192.8 Torr) have been analysed by curve fitting to an expression derived from a simplified discharge scheme which considers complete stabilisation of unstable $(SF_6^-)^*$, followed by a saturated reaction leading to the formation of predominantly $SF_6^-(SF_6)$ clusters. Reduced mobilities for this ion are reported, together with an 'apparent' stabilisation rate constant. (13 refs.)

107327 Fast gas-ionization wave in a laser beam. V.I.Fisher, V.M.Kharash (Astron. Obs., Odessa State Univ., Odessa, Ukrainian SSR).
Sov. Phys.-JETP (USA), vol.83, no.5, p.1004-9 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1738-46 (Nov. 1982). [received: Sept. 1983]
The threshold intensity of laser radiation corresponding to the appearance of a fast ionization wave is determined. The velocity of the nonstationary motion of the plasma front is calculated. The nonstationary motion is characterized by an increase of the front velocity with increase of the gas pressure and this distinguishes it from stationary regimes. The dependences of the front velocity and of plasma temperature behind the front on the laser beam radius are found for the stationary motion of the fast ionization wave. The results of the calculations are in good agreement with the experimental data. (19 refs.)

107328 Experimental research on optical properties of high temperature air in shock tube. Li Hongde, Luo June, Li Siwen (Inst. of Mech., Acad. Sinica, Beijing, China).
Acta Opt. Sin. (China), vol.3, no.4, p.380-4 (1983). In Chinese.
Mainly presents the experimental research on the optical properties of high temperature, low density air using a 800 mm diameter shock tube and a radiometer. The experimental temperature ranges over 4380~7500K; the density ranges over $1.41\times10^{-2}\sim1.00\times10^{-1}\ \rho_0$ (ρ_0 is the standard density at sea level). The spectral wavelengths are 4300, 5400, 6400, 7200 and 10380 Å. The experimental results are compared with the theoretical and experimental results published by other countries and show a good coincidence. The characteristics of the flow field are given and the reliability of experimental results is also analysed. (12 refs.)

(for solid-state plasma, see 72.30)

52.20 ELEMENTARY PROCESSES IN PLASMA

107329 Strong coupling effects on plasma lineshapes and Thomson scattering signals. D.B.Boercker, R.W.Lee, F.J.Rogers (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
J. Phys. B (GB), vol.16, no.17, p.3279-90 (14 Sept. 1983).
The authors use the static correlations calculated from the hypernetted chain equation for the two-component plasma in a generalised Vlasov equation to estimate the effects of strong plasma coupling on spectral lineshapes and Thomson scattering signals. The authors find Thomson scattering to be much more sensitive to such effects than the lineshapes. (21 refs.)

107330 Scattering properties and electrical conductivity for the Coulomb cut-off potential. W.D.Kraeft, M.Luft (Sektion Phys. & Elektronik, Ernst Moritz Arndt-Univ., Greifswald, Germany), A.A.Mihajlov.
Physica A (Netherlands), vol.120A, no.1-2, p.263-78 (1983).
The scattering phase shifts are determined and consequently collisional and transport cross sections. The electrical conductivity of a totally ionized plasma is determined. The resonances located near the origin of the complex momentum plane give rise to minima in the conductance. A comparison with previous results is given. (22 refs.)

52.20F Electron collisions

107331 Suprathermal electron energy deposition in plasmas with the Fokker-Planck method. B.R.Wienke (Computing Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
J. Comput. Phys. (USA), vol.51, no.2, p.208-26 (Aug. 1983).
A one-dimensional multigroup discrete-ordinates technique for computing electron energy deposition in plasmas is detailed. The Fokker-Planck collision operator is employed in the continuous approximation and electric fields (considered external) are included in the equation. Bremsstrahlung processes are not treated. Comparisons with analytic and Monte Carlo results are given. Fits to deposition profiles and energy scaling are proposed and discussed for monoenergetic and Maxwellian sources in the range 0.150 keV, with and without uniform fields. (31 refs.)

107332 Collision operator for a strongly magnetized pure electron plasma. T.M.O'Neil (Dept. of Phys., Univ. of California, San Diego, CA, USA).
Phys. Fluids (USA), vol.26, no.8, p.2128-35 (Aug. 1983).
Collisions are discussed for a pure electron plasma which is so strongly magnetized that the Larmor radius is small compared to the classical distance of closest approach. In this regime, the most important collisions are characterized by an impact parameter which is the order of the distance of closest approach. Assuming that this distance is small compared to the interparticle spacing, a Boltzmann-like collision operator may be derived. In turn, this operator may be reduced to a Fokker-Planck operator, which is integrable. An interesting property of the collision operator results from an adiabatic invariant which is preserved during scattering. There is no energy exchange between the velocity components which are parallel to the field and the velocity components which are perpendicular to the field. This may have implications for a current effort to cool a pure electron plasma to low temperature by cyclotron radiation. (15 refs.)

52.20H Atomic, molecular, heavy-particle collisions

107333 Reactions of carbonyl compounds and Group Ib metals in a plasma in the wake of a spark. W.L.Grady, M.M.Bursey (William Rand Kenan Jr.-Labs. of Chem., Univ. of North Carolina, Chapel Hill, NC, USA).
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.2-3, p.247-58 (1 Sept. 1983).
The reaction of the model system of C_3H_6 and Cu to produce cationized species $C_nH_mCu^+$ in a spark source mass spectrometer proceeds through neutral organic species and Cu^+. On this basis, reactions of Cu^+, Ag^+ and Au^+ with neutral methyl, ethyl and propyl ethanoate, butanone, butanal, 2,4-pentanedione, ethanoic acid and ethanoic anhydride are compared with reactions of similar compounds with laser-generated Cu^+ in an ion cyclotron resonance spectrometer. In the wake of the spark more fragmentation of the cationized organic species is observed. The simple cationized molecule is not observed if the metal ion has low-lying excited states. (26 refs.)

107334 Reactions of Group Ib metal ions with selected hydrocarbons in the source of a spark source mass spectrometer. W.L.Grady, M.M.Bursey (William Rand Kenan Jr.-Labs. of Chem., Univ. of North Carolina, Chapel Hill, NC, USA).
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.2-3, p.259-66 (1 Sept. 1983).
Evidence for the intervention of excited states of Au^+, Ag^+ and Cu^+ in chemical reactions is gathered from differences in the chemistry of the interaction of these ions with hexane, cyclohexene, benzene and propene, and of Au^+ only with butadiene and cyclohexane. Most ions are explained by insertions into C-C bonds; only in the case of Au^+ is there unequivocal evidence for insertion into C-H bonds. The products of decyclotrimerization reactions dominate the Au^+ and Cu^+ spectra of cyclohexene and benzene, and the Au^+ spectrum of cyclohexane. (24 refs.)

107335 Shifts of hydrogen lines from electron collisions in dense plasmas. H.R.Griem (Lab. for Plasma & Fusion Energy Studies, Univ. of Maryland, College Park, MD, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1596-601 (Sept. 1983).
The semiclassical impact-parameter method is used to calculate shifts of Lyman and Balmer lines from levels $n \leq 6$ caused by electrons in a dense plasma. Comparison with measurements and estimates of shifts due to ion quadrupole interactions indicate that shifts from distant electron-atom collisions are the major cause of observed shifts of Balmer lines. Blue shifts from ion-atom quadrupole interactions are relatively small for low series members. (25 refs.)

107336 The role of atomic collisions in fusion. D.E.Post (Plasma Phys. Lab., Princeton Univ., Princeton, NJ, USA).
Physics of Ion-Ion and Electron-Ion Collisions. Proceedings of a NATO Advanced Summer Institute, Baddeck, NS, Canada, 13-26 Sept. 1981 (New York, USA: Plenum 1983), p.37-99
Atomic physics issues have played a large role in controlled fusion research. A general discussion of the present role of atomic processes in both magnetic and inertial controlled fusion work is presented. (111 refs.)

107337 Studies of ion-ion recombination using flowing afterglow plasmas. D.Smith, N.G.Adams (Dept. of Space Res., Univ. of Birmingham, Birmingham, England).
Physics of Ion-Ion and Electron-Ion Collisions. Proceedings of a NATO Advanced Summer Institute, Baddeck, NS, Canada, 13-26 Sept. 1981 (New York, USA: Plenum 1983), p.501-31
The authors describe the advances that have been made in the study of thermal energy ionic recombination using the flowing afterglow/Langmuir probe (FALP) technique which has been developed and exploited during the last few years to study ionic recombination and other low-temperature plasma processes. They also briefly refer to the important contributions to ionic recombination studies which were made prior to the FALP work. (70 refs.)

52.25 PLASMA BASIC PROPERTIES

107338 Thermodynamic parameters and mean radiation path lengths for textolite plasma. G.S.Romanov, L.K.Stanchits, K.L.Stepanov.
J. Appl. Spectrosc. (USA), vol.37, no.5, p.1229-33 (Nov. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.5, p.733-7 (Nov. 1982). [received: Sept. 1983]
Textolite is widely used as a thermoprotective structural material in various devices intended for obtaining and investigating erosional plasma with specified parameters (temperature, pressure, charged-particle concentration, spectral brightness of the radiation, etc.); however, the thermodynamic parameters of textolite plasma have only been calculated in a limited temperature range, and there are no data on the optical characteristics. In view of this, the theoretical analysis of the working conditions of these devices and the plasma parameters realized in them, as well as the interpretation of experimental data, is of approximate, mock-up type. The work outlines the results of calculating the thermodynamic and optical characteristics of the multicomponent plasma of textolite ($C_{37}H_{47}O_{16}$), in the approximation of weak nonideality, in the temperature range $\sim$1-100 eV and the density range $\rho \sim 10^{-6}$-10^{-2} g/cm^3, which allows them to be used for quantitative estimates and calculations in the most diverse of experimental conditions. (14 refs.)

107339 Electric microfield distributions in strongly coupled plasmas. C.A.Iglesias (Dept. of Maths., Rutgers Univ., New Brunswick, NJ, USA), J.L.Lebowitz, D.MacGowan.
Phys. Rev. A (USA), vol.28, no.3, p.1667-72 (Sept. 1983).
A new method is developed for calculating electric microfield distributions in a plasma. The method uses a coupling-parameter integration technique to express the Fourier transform of the microfield distribution in terms of a special pair-distribution function. An approximation of this function yielding the exact second moment of the microfield distribution gives results which agree well with computer simulations for strongly coupled one-component plasmas. (23 refs.)

107340 Effect of radiation and non-Maxwellian electron distribution on relaxation processes in an atmospheric cesium seeded argon plasma. C.A.Borghi, A.Veefkind, J.M.Wetzer (Dept. of Electrical Engng., Eindhoven Univ. of Technol., Netherlands).
Physica B & C (Netherlands), vol.121B+C, no.1-2, p.269-80 (1983).
A model, describing the time-dependent behaviour of a noble gas MHD generator plasma has been set up. With this model it is possible to calculate the relaxation for ionization or recombination as a response to a stepwise temperature development, once the initial and final conditions are given. In the model radiative transitions and a deviation from Maxwellian electron distribution are included. Radiation causes an enhancement of both the ionization relaxation time and the recombination relaxation time. A non-Maxwellian electron distribution results in an increase of the relaxation time for an ionizing plasma because of a depletion of the high energy electrons. A decrease of the relaxation time for a recombining plasma is caused by an excess of high energy electrons. The relaxation time is strongly dependent on the seed ratio and the temperature step. 52.25F Transport properties

107341 Plasma transport in stochastic magnetic fields. III. Kinetics of test particle diffusion. J.A.Krommes, C.Oberman, R.G.Kleva (Plasma Phys. Lab., Princeton Univ., Princeton, NJ, USA).
J. Plasma Phys. (GB), vol.30, pt.1, p.11-56 (Aug. 1983).
For pt.II see Prog. Theor. Phys. Suppl., no.64, p.137-49 (1978). A discussion is given of test particle transport in the presence of specified stochastic magnetic fields, with particular emphasis on the collisional limit. Certain paradoxes and inconsistencies in the literature regarding the form of the scaling laws are resolved by carefully distinguishing a number of physically distinct correlation lengths, and thus identifying several collisional subregimes. The common procedure of averaging the conventional fluid equations over the statistics of a random field is shown to fail in some important cases because of breakdown of the Chapman-Enskog ordering in the presence of a stochastic field component with short autocorrelation length. A modified perturbation theory is introduced which leads to a Kubo-like formula valid in all collisional regimes. The direct-interaction approximation is shown to fail in the interesting limit in which the orbit exponentiation length L_K appears explicitly. A higher-order renormalized kinetic theory in which L_K appears naturally is discussed and used to redrive more systematically the results of the heuristic scaling arguments. (47 refs.)

107342 Numerical evaluation of magnetic coordinates for particle transport studies in asymmetric plasmas. G.Kuo-Petravic, A.H.Boozer (Plasma Phys. Lab., Princeton Univ., Princeton, NJ, USA), J.A.Rome, R.H.Fowler.
J. Comput. Phys. (USA), vol.51, no.2, p.261-72 (Aug. 1983).
A numerical procedure is described for the evaluation of magnetic coordinates given a toroidal scalar-pressure plasma with an arbitrary magnetic field. The accurate representation of magnetic field strength in this way is invaluable for the calculation of drift orbits and transport in asymmetric plasmas. (13 refs.)

107343 Neoclassical transport in a multiple-helicity torsatron in the low-collisionality $(1/\nu)$ regime. K.C.Shaing (Nuclear Engng. Dept., Univ. of Wisconsin, Madison, WI, USA), S.A.Hokin.
Phys. Fluids (USA), vol.26, no.8, p.2136-9 (Aug. 1983).
For a sufficiently high number of toroidal field periods $(m/t>l)$, the magnetic field of a multiple-helicity torsatron can be reduced to a simple form such that the second adiabatic invariant J can be calculated. It is found that the particle and the heat fluxes for a multiple-helicity torsatron in the low-collisionality $(1/\nu)$ regime have the same geometric dependences. An optimization of both quantities is carried out for a given equilibrium constraint. It is shown that the transport fluxes can be smaller than those of the conventional stellarator by an order of magnitude. The effect of finite plasma beta on the neoclassical fluxes is also studied. (9 refs.)

107344 Charged particle motion near a linear magnetic null. Jin-Soo Kim, J.R.Cary (Inst. for Fusion Studies, Univ. of Texas, Austin, TX, USA).
Phys. Fluids (USA), vol.26, no.8, p.2167-75 (Aug. 1983).
Charged particle motion near the null of a two-dimensional magnetic field is studied. Specifically, the magnetic field is given by the vector potential $\mathbf{A} = \hat{z}\psi_0[(y/a)^2 + (\epsilon x/a)^2]$, in which ψ_0, a, and ϵ are constants with ϵ parameterizing the ellipticity of the flux surfaces. Conservation of canonical z momentum p_z reduces the number of nontrivial degrees of freedom to two. Scaling reduces the number of parameters in the system to two, ϵ and σ (the sign of p_z). Analytical and numerical methods are used to study the nature of orbits. The results are expressed conveniently in terms of ϵ and $Q \equiv \sqrt{2mE}/p_z$. When ϵ is unity, the additional symmetry implies integrability. When ϵ is less than unity (the case $\epsilon > 1$ is trivially related) three regimes are found: (1) for $|Q| \gg 1$ particle orbits are regular, (2) for $\epsilon^{3/2} \lesssim |Q \lesssim 1$ most particle orbits are stochastic, and (3) for $|Q| \ll \epsilon^{3/2}$ particle orbits are regular, with the third invariant being the magnetic moment. (20 refs.)

107345 A nonlinear kinetic energy principle for two-dimensional collision-free plasmas. K.Schindler (Theoretische Phys. IV, Ruhr-Univ. Bochum, Bochum, Germany), H.Goldstein.
Phys. Fluids (USA), vol.26, no.8, p.2222-6 (Aug. 1983).
A nonlinear kinetic energy principle is derived for two-dimensional collision-free plasmas and its properties are discussed. The present approach provides a simplified derivation of the small-amplitude limit derived earlier by a different technique. (11 refs.)

107346 Analysis of fast-ion velocity distributions in laser plasmas with a truncated Maxwellian velocity distribution of hot electrons. Y.Kishimoto, K.Mima (Inst. of Laser Engng., Osaka Univ., Osaka, Japan), T.Watanabe, K.Nishikawa.
Phys. Fluids (USA), vol.26, no.8, p.2308-15 (Aug. 1983).
Fast-ion production in laser plasmas with a truncated Maxwellian velocity distribution of hot electrons is investigated by using a new numerical method, namely the systematic Newton's iteration method which has been applied to nonlinear equations. The analysis of the temporal evolution of coronal plasma expansion discloses that the ion-front velocity approaches a constant value within thirty ion plasma oscillation periods, when the high-energy tail is truncated. In such a case, the maximum ion velocity is found to be proportional to the maximum energy of hot electrons. Consequently, the ion velocity distributions are steepened and truncated. Furthermore, it is found that the energy partition of the absorbed laser energy to fast energy to fast ions is appreciably reduced when the maximum electron energy is below a few times the hot-electron temperature. (20 refs.)

107347 Decay of optical discharge plasma. M.Dembinski, J.Kurzyna, Z.Szymanski (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warsaw, Poland).
Physica B & C (Netherlands), vol.121B+C, no.3, p.441-9 (Aug. 1983).
The decay of the high pressure (7, 19 bar) optical discharge argon plasma is studied experimentally and theoretically. Time resolved spatial distributions of electron temperature and density have been measured spectroscopically giving the maximum values $T_e \approx 15000$ and $N_e \approx 8 \times 10^{17}$ cm^{-3}. The characteristic time of the decay is of the order of 10^{-4} s. The experimental results are compared with the calculations based on the solution of the simplified energy equation in the spherically symmetric case. The kinetic and diffusion terms are neglected in the energy balance. It is found that radiation and thermal conduction are the dominant energy loss mechanisms during the decay process. (28 refs.)

107348 An introduction to the theory of diffusive shock acceleration of energetic particles in tenuous plasmas. L.O'C.Drury (Max-Planck-Inst. fur Kernphys., Heidelberg, Germany).
Rep. Prog. Phys. (GB), vol.46, no.8, p.973-1027 (Aug. 1983).
The central idea of diffusive shock acceleration is presented from microscopic and macroscopic viewpoints; applied to reactionless test particles in a steady plane shock the mechanism is shown to produce a power law spectrum in momentum with a slope which, to lowest order in the ratio of plasma to particle speed, depends only on the compression in the shock. The associated time scale is found (also by a macroscopic and a microscopic method) and the problems of spherical shocks, as exemplified by a point explosion and a stellar-wind terminator, are treated by singular perturbation theory. The effect of including the particle reaction is then studied. It is shown that if the scattering is due to resonant waves these can rapidly grow with unknown consequences. The possible steady modified shock structures are classified and generalised Rankine-Hugoniot conditons found. Modifications of the spectrum are discussed on the basis of an exact, if rather artificial, solution, a high-energy asymptotic expansion and a perturbation expansion due to Blandford. It is pointed out that no steady solution can exist for very strong shocks; the possible time dependence is briefly discussed. (75 refs.)

107349 Field of a test body in a stream of charged particles. B.E.Meierovich (S.I. Vavilov Inst. of Phys. Problems, Acad. of Sci., Moscow, USSR).
Sov. Phys.-JETP (USA), vol.83, no.5, p.1016-23 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1756-69 (Nov. 1982). [received: Sept. 1983]
It is shown that the potential of a field created by a test body in a relativistic stream of charged particles includes not only a component which decreases rapidly because of the Debye screening, but also an oscillatory component decreasing slowly with distance and associated with the magnetic interaction between currents. An exact analytic solution is obtained of the problem of a field formed by a charged current-carrying filament placed inside a plasma with a Bennet profile. The long-range field of the interaction between charges and such a current-carrying filament, and also of the interaction of filaments with one another helps to understand better the nature of filamentation of a plasma in high-current channels. The long-range magnetic interaction should affect not only the structure properties of a plasma but also its correlation properties, as well as its thermodynamic and kinetic characteristics. (7 refs.)

107350 Spatial resolved $K\alpha$ spectra of two-structure plasmas in a vacuum spark. S.Morita, J.Fujita (Inst. of Plasma Phys., Nagoya Univ., Nagoya, Japan).
Appl. Phys. Lett. (USA), vol.43, no.5, p.443-5 (1 Sept. 1983).
Spatially resolved Fe$K\alpha$ spectra in the wavelength range of 1.7-2.0 Å (FeII-XXVI) and 1.91-1.95 Å (FeII-XIX) are first observed in a single shot with low-resolution Johansson and high-resolution Johann type crystal spectrometers, respectively. The spectra show the evident proof that the vacuum spark plasma has two different structures. One is a thermalized point plasma ($\lesssim 10$ μm) with high temperature ($T_e \sim 2$ keV) and high density ($n_e \sim 10^{11}$ cm^{-3}). The spectrum contains X-ray lines from FeXXIII-XXVI. The other is an extended plasma (~ 3 mm) associated with nonthermal electrons, where the region of intense emission of $K\alpha$ lines from FeIII-XX shifts toward the cathode with the increase of the ionic charge. (14 refs.)

107351 Stimulated Brillouin scattering due to laser-plasma interactions. Xu Zhi-zhan, Yin Guang-yu, Zhang Yan-zhen, Lin Kang-chun (Shanghai Inst. of Optics & Fine Mech., Acad. Sinica, China).
Acta Phys. Sin. (China), vol.32, no.4, p.481-9 (April 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)* [received: Sept. 1983]
The authors' investigation indicates that if the incident laser contains distinct pre-pulse, the occurrence of stimulated Brillouin scattering under the interaction of high intensity sub-ns pulse laser with plasmas can be self-consistently confirmed. The evidence includes an anomalous increase of the fraction of incident laser energy which is backscattered into the focusing lens the red shift and broadening of spectrum of back-reflected laser, the dramatic reduction of total ion energy and fast ion emission, the enhancement of sidescattered laser light at large scattering angles and so on. (14 refs.)

107352 Experimental observation on 3/2 ω_0 harmonic emission from laser plasma. Chen Shi-sheng, Zhao Qin-chun, Bi Wu-ji, Wang Xiao-qin, He Xing-fa (Shanghai Inst. of Optics & Fine Mech., Acad. Sinica, China).
Acta Phys. Sin. (China), vol.32, no.4, p.544-7 (April 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)* [received: Sept. 1983]
The measurement on the 3/2 ω_0, harmonic emission from laser plasma has been carried out. The experimental results show that harmonic spectra has a blue-shift of about 70 Å and is broadened by about 26 Å when power density on the target surface is about 10^{14} W/cm^2. There is a slight broadening of spectra following the increase of power density on the target surface. (5 refs.)

107353 Oscillator radiation in media with periodic inhomogeneity. V.A.Buts, Yu.P.Machekhin.
Ukr. Fiz. Zh. (USSR), vol.28, no.7, p.1101-2 (July 1983). In Russian.
Investigates of weak periodic inhomogeneity of a medium on the radiation spectrum of an oscillator. It is shown that it is possible for an additional maximum to appear in the region of harmonics with high numbers, the value of which may be comparable with the maximum at the main frequency. 52.30 PLASMA FLOW; MAGNETOHYDRODYNAMICS

(see also 47.65 Fluid dynamics)

107354 Statistical mechanics of a bounded, ideal magnetofluid. L.Turner (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
Ann. Phys. (USA), vol.149, no.1, p.58-161 (Aug. 1983).
A statistical model of a three-dimensional, incompressible, cylindrically bounded, current-bearing magnetofluid is presented for the purpose of gaining insight into the nonlinear relaxation process routinely observed in reversed-field-pinch experiments. An absolute equilibrium ensemble is utilised that incorporates energy, magnetic helicity, and magnetic flux constraints. Results are extracted only after an extensive mathematical treatment of the properties of poloidal and toroidal fields. The model predicts the presence of magnetic fluctuations about a cylindrically symmetric, Bessel-function-model, mean magnetic field, which satisfies $\nabla \times \langle \mathbf{B} \rangle = \mu \langle \mathbf{B} \rangle$. As Taylor's Θ-parameter approaches 1.56, the model predicts that the significant region of the fluctuation spectrum narrows down to a single (coherent) $m=1$ mode. An analogy between the Debye length of an electrostatic plasma and μ^{-1} suggests the physical validity of the model's prediction of the magnetic-field-fluctuation autocorrelation tensor $\langle \delta\mathbf{B}(\mathbf{r}) \delta\mathbf{B}(\mathbf{r}') \rangle$, when $|\mathbf{r}-\mathbf{r}'| \geq \mu^{-1}$. (26 refs.)

107355 Radial flow due to convective cells in drift waves. N.Bekki (Dept. of Phys., Nagoya Univ., Nagoya, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2736-41 (Aug. 1983).
Anomalous transport due to the excitation of convective motion in the drift waves is investigated. A set of model equations describing the interaction among the drift waves and the convective cells is derived, and the general dispersion relation is presented for the decay instability. It is shown that the spectrum of the growth rate is broad and that an excited convective cell by the drift waves can cause a radial flow (the direction along the density-inhomogeneity) in the cold ion plasma. (9 refs.)

107356 A linear model for the tearing mode of a Tokamak plasma with flow and a resistive wall boundary condition. T.H.Jensen, M.S.Chu (GA Technol. Inc., San Diego, CA, USA).
J. Plasma Phys. (GB), vol.30, pt.1, p.57-63 (Aug. 1983).
The tearing mode of a tokamak plasma without flow may be stabilized by the presence of a conducting wall surrounding the plasma. When the wall has a finite resistivity, its presence does not affect stability, only growth rates. If, however the plasma has a flow relative to the resistive wall, both stability and growth rates may be affected. For the cylindrical, circular cross-section tokamak the problem is formulated as a complex eigenvalue problem, with a complex eigenvalue Δ', which in the limit of vanishing flow becomes identical to the usual 'delta prime'. The real part of Δ' describes as usual the power absorbed at the singular surface while the imaginary part describes absorption of momentum. For a plasma with shearless flow, a resistive wall has a stabilizing effect which even for relatively small flow velocities approaches that of a wall of infinite conductivity. Shear flow is found inherently destabilizing, but important only for very large flow velocities. (4 refs.)

107357 Inhomogeneous stationary states of two-dimensional magnetofluids. R.Calinon (Dept. de Phys., Ecole Polytech. Federale de Lausanne, Lausanne, Switzerland), D.Merlini.
J. Plasma Phys. (GB), vol.30, pt.1, p.95-107 (Aug. 1983).
The authors discuss ensemble inhomogeneous states of general two-dimensional magnetofluids. A subclass of approximate statistical inhomogeneous states of the model equation is constructed using the principle of maximum entropy. The fields are shown to satisfy generalized nonlinear Poisson equations and some limiting cases are solved analytically. The method is

then applied to a pseudo-three-dimensional model of an electromagnetic filamentation instability. The results illustrate the general role of the global constants of the motion on the nature of the statistical profiles for the fields describing the most probable states in magnetofluids. (17 refs.)

52.35 WAVES, OSCILLATIONS, AND INSTABILITIES IN PLASMA

107358 On the ponderomotive effects at the lower hybrid waves excitation. V.A.Petrzilka, R.Klima, P.Pavlo (Inst. of Plasma Phys., Czechoslovak Acad. of Sci., Praha, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.9, p.1002-10 (1983).
Due to ponderomotive density modulations at the plasma edge, the propagation of the lower hybrid primary wave changes. The third spatial harmonic wave is generated. The nonlinearities in question do not modify the directionality of the primary wave. The directionality of the third harmonic wave inside the plasma approximately equals the directionality of the primary wave. The results are important for the high frequency current drive in Tokamaks. (8 refs.)

107359 Relaxation of runaway electron energies due to excitation of high frequency waves. T.Michishita, H.Nishihara (Dept. of Nuclear Engng., Kyoto Univ., Kyoto, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2371-8 (July 1983).
The relaxation process of the runaway electron energy in a plasma is studied numerically by using quasi-linear equations combined with a Fokker-Planck collision term. It is assumed that the relaxation is caused by the interactions of the runaway electrons with the plasma waves of $\omega_k=\omega_{pe}k_z/k$. It is shown that the perpendicular energy of the runaway electrons increases rapidly with time, while that of the parallel one decreases relatively slowly. Time developments of the wave spectrum and the electron distribution function are examined in detail. The relaxation process is closely correlated with the asymptotic value of the energy density of the plasma wave excited.

107360 Scattering of waves by Langmuir solitons. J.T.Mendonca (Centro de Electrodinamica, Inst. Superior Tecnico, Lisbon, Portugal).
J. Plasma Phys. (GB), vol.30, pt.1, p.65-73 (Aug. 1983).
Scattering of electromagnetic and electrostatic waves by one-dimensional Langmuir solitons in a uniform and isotropic plasma is studied analytically using a perturbation method. Mode conversion via scattering by solitons is also considered. The results are also relevant for the case of ion-acoustic solitons. (11 refs.)

107361 Linear density drift instabilities in very low beta plasmas: a different approach. S.P.Gary (Earth & Space Sci. Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
J. Plasma Phys. (GB), vol.30, pt.1, p.75-94 (Aug. 1983).
The author reports a study of the linear Vlasov electromagnetic dispersion equation for density drift instabilities in very low β plasmas. A uniform magnetic field and a weak uniform density gradient are assumed. This differs from most other studies of this topic in three important ways: (i) no low-frequency or long-wavelength approximations are made, (ii) no gauge condition is imposed and (iii) a modification of the local approximation is used which is argued to be less arbitrary than the usual local approximation. Numerical solution of the resulting dispersion equation yields stabilization of the universal density drift instability at values of β somewhat higher than those obtained from the local approximation, and near maximum growth shows no evidence of coupling between the universal and Alfven modes. (23 refs.)

107362 Forced reconnexion by fast magnetosonic waves in a current sheet with stagnation-point flows. J.Sakai (Dept. of Appl. Maths. & Phys., Toyama Univ., Toyama, Japan).
J. Plasma Phys. (GB), vol.30, pt.1, p.109-24 (Aug. 1983).
Forced reconnexion due to tearing modes driven by fast magnetosonic waves in a current sheet with stagnation-point flows is discussed. The current sheet with stagnation-point flows which is weakly unstable against tearing modes can be strongly destabilized by vortex motions due to the ponderomotive force of the fast magnetosonic wave. This forced tearing instability can be driven when the incident fast magnetosonic wave intensity, I, exceeds a critical value given by $I_c=(\bar{v}_A/v_g)(kl)^{-3/2}(v_0/\bar{v}_A)^{-1/2}$, where $\bar{v}_A$ is the Alfven velocity, v_g the group velocity of the fast wave, v_0 the background inflow velocity, l the thickness of the current sheet and k the wavenumber of the forced tearing mode. The growth rate is estimated. Applications to solar flares and magnetopause reconnexion processes are briefly discussed. (61 refs.)

107363 Weakly relativistic dielectric tensor and dispersion functions of a Maxwellian plasma. V.Krivenski, A.Orefice (Istituto de Fisica del Plasma, CNR, Milano, Italy).
J. Plasma Phys. (GB), vol.30, pt.1, p.125-31 (Aug. 1983).
In order to study the absorption and emission properties of a magnetized plasma in the electron cyclotron range of frequencies, the weakly relativistic (Shkarofsky) plasma dispersion functions are simply and exactly expressed in terms of the Z function. This gives a useful working form to the dielectric tensor, for any wave vector and harmonic number, covering also the case of electron Maxwellian distributions drifting along the magnetic field. (10 refs.)

107364 Plasma boundary motion and the ion-acoustic wave. N.St.J.Braithwaite, L.M.Wickens (Dept. of Engng. Sci., Univ. of Oxford, Oxford, England).
J. Plasma Phys. (GB), vol.30, pt.1, p.133-51 (Aug. 1983).
Ion-acoustic waves can be launched into plasmas by applying an oscillating voltage wave form to an electrode. The precise mechanism by which these waves are launched from such an electrode is not fully understood. The work described examines the modelling of sheath edge motion in connexion with acoustic wave launching in both planar and spherical geometries. A novel demonstration of the applicability of the kinetic Bohm criterion is given by using the method of characteristics. A characteristics analysis is also used to show that an expanding, but decelerating, non-planar sheath can give rise to quasi-neutral compression like features in a plasma. In planar geometry neither this kind of expansion, nor an oscillatory sheath motion, generates compression-like features. (14 refs.)

107365 Transport by weak electrostatic density drift fluctuations. J.J.Sanderson, S.P.Gary (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
J. Plasma Phys. (GB), vol.30, pt.1, p.153-68 (Aug. 1983).
Expressions are derived for transport by weak electrostatic microfluctuations driven unstable by a density gradient perpendicular to a uniform magnetic field in a Vlasov plasma. These expressions, which are evaluated for the universal and lower-hybrid density drift instabilities, provide improved physical interpretations for various wave-particle exchange frequencies previously reported. Wave-particle effects generally reduce the free energy driving these instabilities, and that some forms of steady-state distribution functions are inappropriate for nonlinear theory. (11 refs.)

107366 Radiation damping of waves in a cold magnetized plasma. L.S.Kuz'menkov, P.B.Podosenov, P.A.Polyakov (Dept. of Theoretical Phys., Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.6, p.71-5 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.6, p.62-6 (1982).
The authors study the dispersion and radiation damping of waves in a cold magnetized plasma. The appropriate analytical formulae are given for various frequency cases. It is shown that in a strong magnetic field, the decrement of radiation damping of electromagnetic waves with the right hand circular polarization and the decrement of oscillations near the cyclotron and hybrid frequencies, are proportional to the square of the cyclotron frequency. In a weak magnetic field, the radiation damping decrements of all modes are proportional to the square of the plasma frequency. (7 refs.)

107367 Bifurcation of thermal equilibria in ohmically heated plasmas. V.Zampaglione (EURATOM-ENEA sulla Fusione, Centro Ricerche Energia Frascati, Rome, Italy).
Phys. Lett. A (Netherlands), vol.97A, no.4, p.155-8 (22 Aug. 1983).
Stability of thermal equilibria of cylindrical plasmas are studied in the case where ohmic heating is balanced by thermal diffusion for a wide class of heat conductivities depending both upon the temperature and the azimuthal magnetic field. (12 refs.)

107368 Ion-acoustic solitary waves in a magnetized plasma with arbitrary electron equation of state. E.Witt, W.Lotko (Space Sci. Lab., Univ. of California, Berkeley, CA, USA).
Phys. Fluids (USA), vol.26, no.8, p.2176-85 (Aug. 1983).
The oblique propagation of fully nonlinear, slow ion-acoustic solitary waves in a collisionless, low-beta, magnetized plasma is examined. The analysis includes the effects of a finite ion pressure, electron trapping, and multicomponent particle populations. The existence of both compressive and rarefactive modes propagating obliquely to the magnetic field in a plasma with two distinct Boltzmann electron populations and cold ions is demonstrated. It is shown that paired electrostatic shocks observed over the Earth's auroral zone may be closely related to the rarefactive modes. As a measure of the collisionless dissipation encountered by the solitary waves, the linear response of the plasma to slow ion-acoustic waves is also examined. (25 refs.)

107369 Purely growing thermal instability of an electromagnetic wave in a collisional plasma. A.K.Sharma, V.K.Tripathi (Lab. for Plasma & Fusion Energy Studies, Univ. of Maryland, College Park, MD, USA).
Phys. Fluids (USA), vol.26, no.8, p.2186-8 (Aug. 1983).
A high-amplitude electromagnetic wave propagating through a collisional plasma heats the electrons to a temperature higher than that of the heavy particles. This state is, however, shown to be unstable to a purely growing temperature higher than that of the heavy particles. This state is, however, shown to be unstable to a purely growing temperature perturbation with $\mathbf{k}\perp\mathbf{k}_0$; $\mathbf{k}$ and $\mathbf{k}_0$ being the wave vectors of the perturbation and the pump. The temperature perturbation modulates the local electron resistivity and generates two sidebands. The sidebands couple with the pump to heat the electrons and hence to enhance the temperature perturbation. The growth rate of the instability in a strongly ionized plasma is of the order of $\nu_0\omega_p\alpha^{1/2}m^{1/4}/2\omega_0(1+\alpha)m_i^{1/4}$, where $\alpha\simeq v_0^2/3c_s^2$ is a nonlinearity parameter, v_0 and c_s are the electron oscillatory and ion thermal velocities, ν_0 and ω_p are the electron collision and plasma frequencies, ω_0 is the frequency of the pump, and m and m_i are the electron and ion mass. (13 refs.)

107370 Runaway electron instability in the high-density ($\omega_{pe}/\Omega_e>0.5$), low-electric-field ($E/E_D<0.05$) regime. R.F.Gandy, D.A.Hitchcock, S.M.Mahajan, R.D.Bengtson (Fusion Res. Center, Univ. of Texas, Austin, TX, USA).
Phys. Fluids (USA), vol.26, no.8, p.2189-92 (Aug. 1983).
The characteristics of the runaway instability are studied for the high-density ($\omega_{pe}/\Omega_e>0.5$) and low-electric-field ($E/E_D<0.05$) cases. For this experimentally relevant case, the wave oscillation frequency as well as the growth rate are calculated for a variety of plasma parameters. (7 refs.)

107371 Wave precession as a consequence of the nonlinearly developed birefringence in plasmas. B.Chakraborty, S.N.Paul (Dept. of Math., Jadavpur Univ., Calcutta, India).
Phys. Fluids (USA), vol.26, no.8, p.2193-4 (Aug. 1983).
In plasmas, even in the absence of any static magnetic field, due to nonlinearities of the medium, the left and right circular polarization components of a strong electromagnetic wave are found to have different dispersion rates. Using this property of nonlinearly induced birefringence, the rate of precessional rotation and wavenumber shift of a strong ellipticity polarized electromagnetic wave passing through a cold, homogeneous, collision-free, and unmagnetized plasma are derived analytically. (17 refs.)

107372 Discrete Alfven eigenmode spectrum in magnetohydrodynamics. M.Swadesh, D.W.Ross (Inst. for Fusion Studies, Univ. of Texas, Austin, TX, USA), Gwo-Liang Chen.
Phys. Fluids (USA), vol.26, no.8, p.2195-9 (Aug. 1983).
The conditions for the existence of global Alfven eigenmodes below the continuum are investigated, and an analytical dispersion relation describing the modes is obtained. In cylindrical geometry, the curvature together with gradients of the equilibrium current (magnetic shear), and finite ω/ω_{ci} effects are responsible for these modes which could play an important part in Alfven wave heating of Tokamak plasmas. (9 refs.)

107373 A solution of the linear wave conversion problem in weakly inhomogeneous plasmas. D.J.D.Gambier (EURATOM-CEA, Fontenay-aux-Roses, France), J.P.M.Schmitt.
Phys. Fluids (USA), vol.26, no.8, p.2200-9 (Aug. 1983).
The wave equation for electromagnetic and electrostatic waves propagating in a weakly inhomogeneous plasma is studied near a conversion layer (any layer where the WKB approximation breaks down). The wave equation is approximated by a Laplace equation, $[\mathrm{P}(id/dx)-x\mathrm{Q}(id/dx)]E(x)=0$, where P and Q are polynomials of arbitrary order. The general solution is given in terms of contour integrals. Simple transformations on sets of contours allows connection of the WKBJ asymptotic solutions on both sides of the conversion layer. The mathematical technique is general (matrix operations) and is well suited to numerical computation. The method is illustrated by solving the fourth-order problems met in ion-cyclotron fast-wave and lower-hybrid wave conversion. (17 refs.)

107374 Beta and density limits in Tokamaks. H.R.Strauss (Courant Inst. of Math. Sci., New York Univ., New York, USA).
Phys. Fluids (USA), vol.26, no.8, p.2219-21 (Aug. 1983).
Ballooning modes with toroidal mode number $n=1$, 2 can be stable in Tokamaks for all beta. Below a density limit, modes with all n can be stable

for any beta, because of finite-Larmor-radius effects. The critical density, found for a particular choice of model profiles, is somewhat below the density of actual experiments, such as the ISX-B Tokamak. However, finite-Larmor-radius effects can still raise the critical beta for instability and substantially restrict the number of unstable modes. (10 refs.)

107375 Fast reconnection of magnetic fields in a plasma. Pung Nien Hu (Courant Inst. of Math. Sci., New York Univ., New York, NY, USA).
Phys. Fluids (USA), vol.26, no.8, p.2234-9 (Aug. 1983).
The reconnection process of magnetic fields in a plasma is analytically studied by perturbing the boundary conditions on a slab of incompressible plasma with a resonant surface inside. It is found, for small resistivity, that the reconnection takes place on an Alfven time scale and continues into a slow time scale $t_1=\eta^{1/3}t$. both time scales are faster than the usual tearing time scale. Furthermore, the plasma evolves globally from its initial equilibrium on the slow time scale and settles down to a different final equilibrium. (10 refs.)

107376 Effects of toroidicity on resistive tearing modes. R.Izzo, D.E.Monticello, W.Park, J.Manickam, H.R.Strauss, R.Grimm, K.McGuire (Princeton Plasma Phys. Lab., Princeton, NJ, USA).
Phys. Fluids (USA), vol.26, no.8, p.2240-6 (Aug. 1983).
A reduced set of resistive magnetohydrodynamic (MHD) equations is solved numerically in three dimensions to study the stability of Tokamak plasmas. Toroidal effects are included self-consistently to leading and next order in inverse aspect ratio ϵ. The equations satisfy an energy integral. In addition, the momentum equation yields the Grad-Shafranov equation correct to all orders in ϵ. Low-beta plasmas are studied using several different q profiles. In all cases, the linear growth rates are reduced by finite toroidicity. Excellent agreement with calculations using the resistive PEST code is obtained. In some cases, toroidal effects lead to complete stabilization of the mode. Nonlinear results show smaller saturated island widths for finite aspect ratio compared to the cylindrical limit. If the current channel is wide enough so as to produce steep gradients towards the outside of the plasma, both the finite-aspect-ratio cases and cylindrical cases disrupt. (8 refs.)

107377 'Stabilization' of the lower-hybrid-drift instability in finite-β plasmas. J.F.Drake (Science Applications Inc., McLean, VA, USA), J.D.Huba, N.T.Gladd.
Phys. Fluids (USA), vol.26, no.8, p.2247-9 (Aug. 1983).
The stability properties of the lower-hybrid-drift instability are reexamined for finite-β plasmas. In contrast to previous results, it is found that finite-β does not stabilize the instability in the sense that the growth rate becomes negative. Rather, as β increases, the fastest growing mode shifts to longer wavelengths and makes a transition to an ion-cyclotron mode when the growth rate falls below the ion-cyclotron frequency. (10 refs.)

107378 Modulation of the current-driven ion-cyclotron instability by the potential relaxation instability. R.Schrittwieser (Dept. of Phys., Univ. of California, Irvine, CA, USA).
Phys. Fluids (USA), vol.26, no.8, p.2250-5 (Aug. 1983).
An experimental investigation in a single-ended current-carrying Q machine is presented in which the radius of the current channel is varied. For increasing radius R (where R is normalized to the ion Larmor radius) the electrostatic ion-cyclotron instability is excited mainly at first. For $R \gtrsim 7$, however, the potential relaxation instability mainly appears. In the transition region both instabilities are observed but the amplitude of the cyclotron instability is strongly modulated with the frequency of the relaxation instability. This is because of the periodic current limitation by the latter which nearly inhibits the electron drift necessary for the excitation of the former. (24 refs.)

107379 Instability of the boundary layer between a streaming plasma and a vacuum magnetic field. W.Peter, R.Amiram (Dept. of Phys., Technion-Israel Inst. of Technol., Haifa, Israel), N.Rostoker.
Phys. Fluids (USA), vol.26, no.8, p.2276-80 (Aug. 1983).
Analysis is carried out for the long-wavelength stability of the boundary layer formed when a plasma or neutralized ion beam is incident upon, and reflected by, an applied magnetic field. This equilibrium is similar to the Ferraro-Rosenbluth sheath which forms the basis for many models in magnetic fusion and magnetospheric physics. For wavelengths much greater than the sheath thickness a_h, the equilibrium is unstable with growth rate (in the regime $ka_\mathrm{h} \ll m/M$) proportional to $(kg)^{1/2} \equiv (ka_\mathrm{h}\Omega_\mathrm{i}\Omega_\mathrm{e})^{1/2}$. The nonlinear evolution of the instability describes plasma propagation across the magnetic field. This instability is similar to the classical flute instability except that polarization along the boundary is due to electron, and not ion, motion. (15 refs.)

107380 Bandwidth effects in Brillouin scattering from inhomogeneous plasma. G.R.Mitchel (Inst. de Recherche d'Hydro-Quebec, Varennes, Quebec, Canada), T.W.Johnston, H.Pepin.
Phys. Fluids (USA), vol.26, no.8, p.2292-8 (Aug. 1983).
Convective Brillouin amplification in inhomogeneous, drifting plasmas is discussed. The bandwidth of the amplifier is a function of both wave damping and plasma inhomogeneity. For any given plasma model and source spectrum, the final amplified spectrum can be constructed, including the effects of inhomogeneity, drift, damping, and gain narrowing. Conversely, the shape of observed spectra of Brillouin scattering can be used to obtain information about conditions in the underdense plasma corona if it can be assumed that amplification is high enough that the final spectra bandwidth is amplifier dominated. (22 refs.)

107381 Self-consistent eigenvalue analysis of Rayleigh-Taylor instability in an ablating plasma. H.Takabe, L.Montierth, R.L.Morse (Dept. of Nuclear & Energy Engng., Univ. of Arizona, Tucson, AZ, USA).
Phys. Fluids (USA), vol.26, no.8, p.2299-307 (Aug. 1983).
A mathematical method for a fully self-consistent treatment of the Rayleigh-Taylor instability is developed by solving the linearized fluid equations as an eigenvalue problem. The method is applied to analyze the instability in stationary ablating plasmas with strong inhomogeneity. A reduction of growth rate compared to the classical value is found. The importance of a self-consistent treatment of the Rayleigh-Taylor instability is shown by comparing the result with the growth rate estimated by approximate theoretical arguments. (10 refs.)

107382 Nonlinear coupling of drift waves, convective cells, and magnetic drift modes in finite-β plasmas. H.U.Rahman, J.Weiland (Inst. for Electromagnetic Field Theory, Chalmers Univ. of Technol., Goteborg, Sweden).
Phys. Rev. A (USA), vol.28, no.3, p.1673-8 (Sept. 1983).
A set of three coupled nonlinear equations describing electrostatic drift waves, drift Alfven waves, convective cells, and magnetic drift modes has been derived for finite ion temperature. The reduction to simplified nonlinear model equations in different β regimes and the consequences for transport properties are discussed. (24 refs.)

107383 Stimulated scattering of a large amplitude electromagnetic wave by the eigenmodes of a plasma slab. O.M.Gradov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Phys. Scr. (Sweden), vol.28, no.2, p.214-16 (Aug. 1983).
The stimulated scattering of strong radiation by the low-frequency ion-sound oscillations (Brillouin scattering) as well as by the longitudinal surface modes of a plasma slab is considered. It is shown that the leaking eigenmodes of the slab then can be excited. The scattered wave intensity, taking into account the generation of harmonics, is also calculated. (6 refs.)

107384 Transition to chaos for ballooning modes stabilized by finite Larmor radius effects. J.Weiland, H.Wilhelmsson (Inst. for Electromagnetic Field Theory, Chalmers Univ. of Technol., Goteborg, Sweden).
Phys. Scr. (Sweden), vol.28, no.2, p.217-20 (Aug. 1983).
The nonlinear dynamics of interacting ballooning modes, stabilized by finite Larmor radius effects is analyzed in terms of a set of equations, which exhibit stochastic properties. These are explicitly shown to depend on the balance between shear and driving pressure force. The onset of bifurcations and chaotic behaviour are directly identified with certain values of parameters characterizing the physical system. (17 refs.)

107385 Near-resonant interaction of longitudinal plasma waves. S.C.Van Someren Greve, A.J.D.Lambert, F.W.Sluijter (Dept. of Appl. Phys., Eindhoven Univ. of Technol., Eindhoven, Netherlands).
Physica B & C (Netherlands), vol.121B+C, no.1-2, p.255-68 (1983).
The theory of the weakly non-linear interaction of three coherent longitudinal plasma waves in an unmagnetized plasma is studied and generalized by replacing the exact resonance condition for the real parts of the natural frequencies by a near resonant one. The kinetic description is used. One of the waves has an amplitude much larger than the other two and is assumed to be undamped. Especially the situation in which this large amplitude wave can give rise to instability is considered. The possibility of a small mismatch enables one to study the interaction of three ion waves. The possibility of instability in this case is conjectured. (11 refs.)

107386 Some aspects of transformation of the nonlinear plasma equations to the space-independent frame. S.N.Paul, B.Chakraborty (Dept. of Math., Jadavpur Univ., Calcutta, India).
Physica B & C (Netherlands), vol.122B+C, no.1, p.139-49 (Sept. 1983).
Nonlinear field equations for a cold plasma are transformed from the laboratory frame to the space-independent frame for a transverse wave using a special Lorentz transformation. With the help of this transformation a set of partial differential equations can be reduced to a set of ordinary differential equations in a single independent variable. The equations of Akhiezer and Polovin (1956) for nonlinear plasma oscillations have been generalized and the results of Arons and Max (1974) and others for the wave number shift and the precessional rotation of a strong electromagnetic wave are recovered by analytically finding the nonlinearly developed birefringence effect in a cold, relativistic, collisionless unmagnetized plasma. (22 refs.)

107387 Parametric and combination wave plasma. Processes in the low-hybrid electron frequency range. Excited by high-frequency electric pump field. I. S.A.Aliev, G.S.Kirichenko.
Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1173-9 (Aug. 1983). In Russian.
Electron low-hybrid potential plasma oscillations were studied. Two ways were used for wave excitation: external high-frequency pumping and electron beam injection along the magnetic field. Aperiodic parametric wave plasma instability for multiple pumping frequencies and beam plasma instability were identified and investigated. (9 refs.)

107388 Collisional damping of plasma cyclotron oscillations. V.Yu.Gonchar, A.F.Korzh, K.N.Stepanov.
Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1180-5 (Aug. 1983). In Russian.
Damping of the longitudinal electron cyclotron and ion cyclotron oscillations caused by Coulomb particle collisions is found for the arbitrary values of $k\rho_{\mathrm{L}\alpha}$ (k is the wave number, $\rho_{\mathrm{L}\alpha}$ Larmor radius of the electrons and ions $\alpha=e,i$). It is shown that the damping of electron cyclotron oscillations is due to both the collisions between electrons and ions and collisions between electrons. The damping of the ion cyclotron oscillations is caused by ion collisions only. (8 refs.)

107389 Vortex and magnetostatic-mode turbulence produced by a Buchsbaum mode. H.U.Rahman, P.K.Shukla (Inst. for Theoretische Phys., Ruhr-Univ. Bochum, Bochum, Germany), S.G.Tagare.
Phys. Rev. A (USA), vol.28, no.3, p.1692-9 (Sept. 1983).
It is found that the modulational instability of a finite-amplitude Buchsbaum mode can give rise to enhanced vortex, (convection cells) and magnetostatic modes in a D-T fusion plasma The relevance of the investigation to the anomalous particle and heat losses in a Tokamak device is briefly pointed out. (18 refs.)

107390 On the weak turbulence theory of an inhomogeneous plasma. N.M.El-Siragy, Y.A.Sayed, V.L.Sizonenko (Atomic Energy Authority, Cairo, Egypt).
Physica B & C (Netherlands), vol.122B+C, no.1, p.113-28 (Sept. 1983).
The nonlinear dispersion and kinetic wave equations for drift potential oscillations of a weakly inhomogeneous plasma is obtained. It is shown, that taking into consideration the Coulomb collisions makes it possible to remove divergences in matrix elements, describing the nonlinear wave interaction. (10 refs.)

107391 Laser-driven shock-wave propagation in pure and layered targets. D.Salzmann, S.Eliezer, A.D.Krumbein, L.Gitter (Soreq Nuclear Res. Centre, Yavne, Israel).
Phys. Rev. A (USA), vol.28, no.3, p.1738-51 (Sept. 1983).
The propagation properties of laser-driven shock waves in pure and layered polyethylene and aluminum slab targets are studied for a set of laser intensities and pulse widths. The laser-plasma simulations were carried out by means of the one-dimensional Lagrangian hydrodynamic code. It is shown that the various parts of laser-driven compression wave undergo different thermodynamic trajectories. The shock front portion is on the Hugoniot curve whereas the rear part is closer to an adiabat. It is found that the shock front is accelerated into the cold material till $t \approx 0.8\tau$ (where τ is the laser pulse width) and only later is a constant velocity propagation attained. The scaling laws obtained for the pressure and temperature of the compression wave in pure targets are in good agreement with those published in other works. In layered targets, high compression and pressure were found to occur at the interface of CH_2 on Al targets due to impedance mismatch but were not found when the layers were reversed. The persistence time of the high pressure on the interface in the CH_2 on Al case is long enough relative to the characteristic times of the plasma to have an appreciable influence on the shock-wave propagation into the aluminium layer. This high pressure and compression on the interface can be optimized by adjusting the CH_2 layer thickness. (18 refs.)

107392 Propagation of electromagnetic waves in a planarly stratified, isotropic, warm plasma with a resonance layer. L.P.J.Kamp, M.P.H.Weenink (Dept. of Electrical Engng., Eindhoven Univ. of Technol., Eindhoven, Netherlands).
Physica B & C (Netherlands), vol.122B+C, no.1, p.879-112 (Sept. 1983).
A linear theory is developed for the absorption and conversion of electromagnetic waves in a planarly stratified, isotropic, warm plasma for arbitrary angles of incidence. In particular the case is investigated in which the frequency of the wave is equal to the local plasma frequency somewhere in the plasma (resonance plane). The polarization of the waves considered here is such that the electric field has a component parallel to the gradient of the plasma density (TM-polarization). The temperature is assumed to be constant. The given theory is more general than the existing theories for the following reasons: (1) The unperturbed electric field due to the inhomogeneity has been incorporated. (2) Better approximations away from the resonance plane are given. (3) The theory holds for arbitrary density profiles. Errors in the existing literature are corrected. The problem is studied by means of internal-boundary-layer theory and Langer's method. Explicit expressions for the behaviour of the various field components and the pressure perturbation as well as the linear excitation of a plasma wave are given in the whole region of interest. (17 refs.)

107393 Further observations on resonance cones in non-Maxwellian plasmas. H.Thiemann, N.Singh (Center for Atmospheric & Space Sci., Utah State Univ., Logan, UT, USA).
Radio Sci. (USA), vol.18, no.4, p.615-24 (July-Aug. 1983).
Resonance cones in a hot magnetized non-Maxwellian plasma are investigated. The non-Maxwellian nature of the plasma is described by two electron populations: a background population and an electron beam with variable beam parameters. The theoretical formulation for a finite magnetic field is given. The resonance cone dispersion relation is presented and numerical results on the angular distributions of the potential are given. The propagation of waves outside the resonance cones is also described. (15 refs.)

107394 Scattering and absorption of electromagnetic waves by an inhomogeneous plasma column. S.Yamaguchi, K.Mori, T.Hosono (Coll. of Sci. & Technol., Nihon Univ., Tokyo, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part B (Japan), vol.J66B, no.5, p.575-82 (May 1983). In Japanese.
Analyzes scattering and absorption of electromagnetic waves by an inhomogeneous plasma column with circular symmetry. Main contents and conclusions are: A modified multilayer method in cylindrical coordinates is developed to improve multilayer method, finite difference method, Euler method and Runge-Kutta method. The relation between truncation error and the maximum angular mode number used is shown. Power flow and absorption of electromagnet energy in collisionless plasma column are analyzed and shown in a graph. Power dissipation in lossy plasma column is analyzed and its distribution in the column is shown in a graph. (8 refs.)

107395 Radiation of nonequilibrium active-molecular plasma half-space and layer. P.K.Golubinski, A.G.Zagorodnii, V.S.Pegova, I.P.Yakimenko.
Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1165-72 (Aug. 1983). In Russian.
A theory of spontaneous emission of electromagnetic waves by semibounded and bounded nonequilibrium active-molecular plasmas has been developed. The influence of the molecular subsystem on the intensity of electromagnetic radiation of a bounded plasma-molecular medium is investigated. (7 refs.)

107397 Coupling mechanism of boundary sheaths and wave launcher in a collisionless plasma. H.Fujita, S.Yagura (Dept. of Electrical Engng., Saga Univ., Saga, Japan).
J. Plasma Phys. (GB), vol.30, pt.1, p.1-9 (Aug. 1983).
The coupling mechanism of boundary sheaths and a wave launcher immersed in a collisionless plasma is experimentally clarified by the addition of an electron emission from the launcher. The wave amplitude increases rapidly with increasing electron emission. The strong increase in a directly coupled signal is a clear observation of ion-acoustic waves which are simultaneously excited at the sheaths. (15 refs.)

107398 Observations of the backward cyclotron wave in a spiral electron beam-plasma system. T.Idehara, N.Sato (Dept. of Appl. Phys., Fukui Univ., Fukui, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2281-4 (July 1983).
The cyclotron waves of higher order ($|n| \geq 2$) are observed in a spiral electron beam-plasma system, in addition to the space charge ($n=0$) and the fundamental cyclotron ($|n|=1$) waves. In the frequency range of $\omega < n\omega_c$, the observed waves are identified to the backward cyclotron waves, by using Fourier and inverse Fourier transformation methods.

107399 Thermodynamic theory of light ion beam propagation in a plasma. T.Kato, T.Ohsawa (Dept. of Appl. Phys., Waseda Univ., Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2720-6 (Aug. 1983).
Propagation of a light ion beam in a plasma is investigated theoretically. The basic principle determining the steady state of the beam transport in a plasma is ascertained from the viewpoints of the theory of the irreversible processes. As a preliminary work to discuss the collisional plasma, the authors consider a state in which the entropy production vanishes and obtain an extended result of Chen and Davidson to include the current due to the drift of the plasma electrons. Two extreme cases are considered: (i) No rotation of the beam around the axis of symmetry or complete neutralization of azimuthal beam current by the plasma electron. (ii) Complete balancing of the electrostatic repulsive force on a beam ion and the magnetically pinching force due to the axial beam current. It is shown that the distribution of ions in a rotational ion beam is given by the Bennett type, provided the current is over-neutralized azimuthally.

107400 Azimuthal current-neutralization of a rotational light ion beam by a plasma. T.Ohsawa, T.Kato (Dept. of Appl. Phys., Waseda Univ., Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2727-35 (Aug. 1983).
The rotational motion of a light ion beam and a plasma immersed in a uniform magnetic field is investigated within the framework of the macroscopic fluid equations including force terms due to radial pressure variations. Drift motion caused by the radial electric and magnetic forces rotates the

beam fluid element and the plasma electron fluid element in the same azimuthal direction. The motion leads to the over-neutralized states. The radial density profiles of the beam are obtained and the condition for radially confined equilibria in those over-neutralized states is examined. (12 refs.)

107401 Nonlinear relaxation of a beam of relativistic electrons in a plasma: nonlinear damping of sound. V.M.Malkin (Inst. of Nuclear Phys., Acad. of Sci., USSR).
Sov. Phys.-JETP (USA), vol.83, no.5, p.997-1003 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1725-37 (Nov. 1982). [received: Sept. 1983]
The authors consider the interaction between a plasma and a beam of relativistic electrons in that range of parameters where the instability of the system against the excitation of Langmuir waves is eliminated by their scattering by the nonlinearly damped sound. They find the distribution function of the beam electrons and the Langmuir wave spectrum. The range of beam densities covered by the quantitative relaxation theory is hereby broadened considerably—now this range stretches up to the limit of applicability of weak turbulence theory. 52.50 PLASMA PRODUCTION AND HEATING

107402 Analysis of target implosion on irradiation by proton beams. I. Beam interaction with target plasma. M.Tamba (Inst. of Phys. & Chem. Res., Saitama, Japan), N.Nagata, S.Kawata, K.Niu.
Laser & Part. Beams (GB), vol.1, pt.2, p.121-49 (May 1983).
Numerical simulations and analyses are given for the implosion of a hollow shell target driven by proton beams. The target consists of three layers of Pb, Al and DT. The Pb and Al layers play roles of a tamper and a pusher, respectively. The main part of the beam energy is deposited in the Al layer. But the process of deposition depends strongly on the distribution of incident angles and particle energies. As the Al layer is heated by proton beam, the layer expands and pushes the DT layer toward the target center. This type of implosion motion is examined by using a similarity solution for the slab model. To obtain an optimum velocity for the DT implosion, the optimum target size and optimum layer thicknesses are determined. The Rayleigh-Taylor instability, accompanied by the implosion motion, is investigated, and the implosion is found to be stable with respect to the chosen target structure. The effects of inhomogeneities on implosion are shown to be severe. (12 refs.)

107403 Theoretical modeling of electromagnetically imploded plasma liners. N.F.Roderick, B.J.Kohn, W.F.McCullough, C.W.Beason, J.A.Lupo, J.D.Letterio (Air Force Weapons Lab., Kirtland AFB, NM, USA), D.A.Kloc, T.W.Hussey.
Laser & Part. Beams (GB), vol.1, pt.2, p.181-206 (May 1983).
The generation of high-energy-density plasmas by the electromagnetic implosion of cylindrical foils (i.e. imploding plasma shells or hollow z-pinches) has been explored analytically and through numerical simulation. Those theoretical investigations have been performed for a variety of foil initial conditions (radius, height, and foil mass) for both capacitive and inductive pulse power systems. The development of the theoretical modeling techniques is presented, covering both circuit models and plasma load models. Results from a series of configurations are given, showing the development of modeling techniques used to study the dynamics of the plasma implosion process and the role of instabilities. Interaction between analytic techniques and detailed numerical simulation has led to improvement in all theoretical modeling techniques presently used to study the implosion process. (21 refs.)

107404 Plasma startup patterns in Tokamak reactors. K.Maki (Energy Res. Lab., Hitachi Ltd., Ibaraki, Japan), T.Tone.
J. Nucl. Sci. & Technol. (Japan), vol.20, no.6, p.443-52 (June 1983).
Plasma startup patterns are studied from the viewpoint of net power loss represented by the total power loss less the α-particle heating power. The existence is shown of a critical temperature of plasma at which the net power loss becomes independent of plasma density. Observations are made which indicate that the net power loss decreases with lowering plasma density in the range below the critical temperature and vice versa, whether governed by empirical or trapped-ion scaling laws. A startup pattern is presented which minimizes the net power loss during startup. The net power loss at critical temperature represents the lower limit of heating power required to bring the plasma to steady state in Tokamak reactors. (18 refs.)

107405 Dependence of loading resistance and wave structures on plasma density of ICRF wave using cold slab model. S.Shinohara, M.Naito, K.Miyamoto (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2622-5 (Aug. 1983).
Numerical calculation of an ICRF wave by the cold slab model with a two-ion species plasma is carried out. This model well explains the dependence of experimental loading resistance on plasma density obtained on TFR, JFT-2, JIPP T-II and TNT-A. The dependence of the radial cavity mode on plasma density is also shown. (14 refs.)

107406 Heating and breakdown of protective layer at plasma retaining wall. A.V.Khachatur'yants (M.I. Kalinin Leningrad Polytech. Inst., Leningrad, USSR).
J. Eng. Phys. (USA), vol.43, no.4, p.1097-9 (Oct. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.4, p.581-4 (Oct. 1982). [received: Sept. 1983]
Expressions are derived for estimating the parameters of the boundary layer of cold plasma forming through the action of radiation on the thermal protection in a pulse-type reactor with wall retention of thermonuclear plasma. (7 refs.)

107407 Absorption of microwaves during resonant heating of plasma with a high concentration of electrons inside a waveguide. P.S.Bulkin, S.A.Dvinin, G.S.Solntsev (Dept. of Electronics, Moscow State Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.6, p.98-101 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.6, p.84-7 (1982).
The authors show the role of resonant absorption and redistribution of a microwave field along the force lines during the interaction of the field with a confined plasma with above-critical electron concentration at low gas pressure. They calculate, and compare with experiments, the absorption and reflection coefficients of microwaves by a plasma column in a waveguide. It is shown that the kinetic processes in the plasma can be controlled effectively by a pulsed microwave heating. (6 refs.)

52.50J Plasma production and heating by laser beams

107408 Picosecond air breakdown studies at 0.53 μm. W.E.Williams, M.J.Soileau, E.W.Van Stryland (Dept. of Phys., North Texas State Univ., Denton, TX, USA).
Appl. Phys. Lett. (USA), vol.43, no.4, p.352-4 (15 Aug. 1983).
The laser induced breakdown thresholds of laboratory air at 0.53 μm were measured for pulses varying from 30 to 140 ps for a variety of focal spot sizes. The breakdown threshold fields were found to be proportional to $1/\sqrt{t_p}$, where t_p is the laser pulse width. Comparison with an earlier work at 1.06 μm under similar conditions indicates that the breakdown thresholds are higher at 0.53 than at 1.06 μm. However, this increase falls short of the λ^{-2} dependence exhibited by cascade ionization. (13 refs.)

107409 Hot-electron energy deposition around unsupported laser targets. K.Eidmann, A.Maaswinkel, R.Sigel, S.Witkowski (Max-Planck-Inst. fur Quantenoptik, Garching, Germany), F.Amiranoff, R.Fabbro, J.D.Hares, J.D.Kilkenny.
Appl. Phys. Lett. (USA), vol.43, no.5, p.440-2 (1 Sept. 1983).
Free-falling spheres, released by a simple mechanism, are used as a laser targets. Hot-electron energy transport upon one-sided irradiation with 300-ps iodine laser pulses (6×10^{15} W cm^{-2}) is studied by various methods, including X-ray pinhole photography and time-resolved shadowgraphy. Spatial energy deposition is consistent with hot-electron spreading in the presence of self-generated magnetic fields, as suggested by recent experiments and simulations. The insensitivity of the results to the presence of a supporting stalk is attributed to inductive decoupling of the target. Free-falling targets open the possibility of highly symmetric implosion experiments. (10 refs.)

107410 On the ionization freezing in expanding laser-produced plasmas. A.Caruso, G.Gatti, C.Strangio (EURATOM-ENEA sulla Fusione, Roma, Italy).
Nuovo Cimento D (Italy), vol.2D, ser.1, no.4, p.1213-19 (July-Aug. 1983).
Some features of the ionization freezing process are discussed in the framework of the simple model of a uniform sphere expanding with constant velocity. (7 refs.)

107411 Electrostatic fields and charged particle acceleration in laser produced plasmas. H.Hora (Dept. of Theoretical Phys., Univ. of New South Wales, Kensington, Australia).
Laser & Part. Beams (GB), vol.1, pt.2, p.151-70 (May 1983).
The author presents a derivation of the spread double layers in the case of inhomogeneous plasmas. It is concluded that the hydrodynamically expected multi GeV heavy ions for 10 TW laser pulses (generated by relativistic self-focusing and nonlinear forces) should produce super-fast ions up to the TeV range. Further conclusions are drawn from the electrostatically measured upshifted (by 300 keV) DT fusion alphas from laser compressed plasma. An analysis of alpha spectra attempts to distinguish between different models of the stopping power in the plasmas. The analysis preliminarily arrives at a preference for the collective model. (73 refs.)

107412 Two-dimensional ion emission from laser-produced plasmas. G.J.Tallents (Dept. of Engng. Phys., Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia).
Laser & Part. Beams (GB), vol.1, pt.2, p.171-80 (May 1983).
The expansion of laser-produced plasmas in two-dimensions is examined analytically using an asymptotic (time→∞) isothermal self-similar model. The ion emission velocity and energy spectra are calculated and expressions given for the number and energy of expanding ions as a function of angle to the target. By relating the total ion kinetic energy of expansion to the temperature of the initial plasma it is shown that ion probe signals give a measure of the initial plasma temperature. The model is extended to a plasma with two digital temperatures (a 'hot' component and a 'cold' component) and it is shown that the ion energy spectra can be used to deduce the initial temperatures of the 'hot' and 'cold' ions and the relative number of the 'hot' ions to the 'cold' ions. The results are used to interpret data from an array of ion probes (at different angles to the target) for a plasma produced by irradiating a 25 μm thick nickel foil with a ~20 ρs neodymium laser pulse. (36 refs.)

107413 The origin of line-free XUV continuum emission from laser-produced plasmas of the elements $62\leq Z\leq74$. G.O'Sullivan (Phys. Dept., Univ. Coll. Dublin, Dublin, Ireland).
J. Phys. B (GB), vol.16, no.17, p.3291-304 (14 Sept. 1983).
The different plasma mechanisms responsible for the continuum emission observed in the 35-2000 Å wavelength region from laser-produced plasmas of targets with $62\leq Z\leq74$ have been studied in detail. The continuum is found to be largely free-bound in origin, especially at shorter wavelengths. The nonappearance of line emission is due to the complexity of the electronic configurations in the ion stages present in the plasma which in nearly every case can contain open 4f subshells. Furthermore 4f, 5p and 4f, 5s level crossing lead to the population of a range of low-lying excited states which increase still further the number of anticipated transitions. As a result, the transitions merge to form narrow bands of quasi-continua which, in the soft X-ray region, enhance the underlying recombination continuum. The XUV emission is observed to be most intense in the 100 Å region where the radiance is estimated to be $>10^{23}$ photons cm^{-2} sr^{-1} Å^{-1} s^{-1}. (31 refs.)

107414 Supersonic radiation waves with motion of plasma. I.V.Nemchinov, M.P.Popova, L.P.Shubadeeva (O.Yu. Schmidt Inst. of Terrestrial Phys., Acad. of Sci., Moscow, USSR).
J. Eng. Phys. (USA), vol.43, no.4, p.1093-7 (Oct. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.4, p.577-81 (Oct. 1982). [received: Sept. 1983]
A numerical solution is obtained to the two-dimensional radiation-gasdynamics problem of plasma formation under laser action. Laser radiation acting on a target produces absorption waves which travel in the opposite direction to the laser beam. The leading role in the wave propagation process can be played here by any of the various mechanisms, heat conduction (slow luminous combustion), hydrodynamics (luminous detonation), or spontaneous thermal radiation of plasma (subsonic and supersonic radiation waves), depending on the density and the composition of the gaseous medium as well as on the flux density and the wavelength of laser radiation and on the duration of the laser pulse. (8 refs.)

107415 Laser irradiation of disk targets at 0.53 μm wavelength. W.Mead, E.M.Campbell, K.G.Estabrook, R.E.Turner, W.L.Kruer, P.H.Y.Lee, B.Pruett, V.C.Rupert, K.G.Tirsell, G.L.Stradling, F.Ze, C.E.Max, M.D.Rosen, B.F.Lasinski (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
Phys. Fluids (USA), vol.26, no.8, p.2316-31 (Aug. 1983).
Results and analyses are presented for laser irradiation of Be-, CH-, Ti-, and Au-disk targets with 0.53 μm light in 3-200J, 600-700 psec pulses, at nominal incident intensities from 3×10^{13} to 5×10^{15} W/cm^2. The measured absorptions are higher than observed in similar 1.06 μm irradiations, and are largely consistent with modeling which shows the importance of inverse-bremsstrahlung and Brillouin scattering. Observed red-shifted back-reflected light shows that Brillouin scattering occurs at low to moderate fluxes of multi-keV X-ray indicate hot-electron fractions of 1% or less, with temperatures of 6 to 20 keV which are consistent with resonance absorption or perhaps $2\omega_{pe}$. Measurements show 30%-50% efficient conversion of absorbed light into sub-keV X-rays, with time-, angular-, and spatial-emission distributions which are generally consistent with non-local-thermodynamic-equilibrium modeling using inhibited thermal electron transport. (41 refs.)

107416 On the influence of surface condition on air plasma formation near metals irradiated by microsecond TEA-CO_2 laser pulses. I.Ursu, I.Apostol, D.Barbulescu, V.Lupei (Central Inst. of Phys., Bucharest, Rumania), I.N.Mihailescu, A.Popa, A.M.Prokhorov, N.I.Chapliev, V.I.Konov.
Rev. Roum. Phys. (Rumania), vol.28, no.4, p.351-3 (1983).
Reports a systematic analysis of the involvement of the main types of defects and impurities in the plasma and vapor initiation stage, with a direct effect on lowering the breakdown threshold in the gas next to the target, which has been pointed out before, as well as in determining the overall evolution of the interaction process. Any complex analysis of the plasma induction process nearby the metal targets should be correlated with a careful scrutiny of the structure and physical-chemical composition of the irradiated surface. (7 refs.)

107417 Thermophysical target properties in ion collection measurements on TEA-CO_2 laser produced high-Z plasmas. E.Cojocaru (Nat. Center of Phys., Inst. for Phys. & Technol. of Radiation Devices, Bucharest, Rumania).
Rev. Roum. Phys. (Rumania), vol.28, no.6, p.507-12 (1983).
Some results of ion collection measurement for TEA-CO_2 laser produced plasmas on high-Z metallic targets are presented in this paper. The different signal shapes for low and high fusible targets are explained taking into account the different thermophysical target parameters. At about 10^{10} W/Cm^2 incident laser intensity, for low fusible targets a developed vaporization can take place which is the cause of a rather early appearance of the first high peak in the collector signal. At the same intensity, in the high fusible target case, a gradual vaporization takes place which can explain the two-peak structure of the ion collector signal. (10 refs.)

107418 Effects of giant laser pulses on a quasisteady plasma jet. S.I.Anisimov, V.A.Batanov, V.P.Gorkovskii, N.N.Zhukov, V.P.Kopylov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. Phys.-JETP (USA), vol.83, no.5, p.1010-15 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1747-55 (Nov. 1982). [received: Sept. 1983]
An investigation was made of the processes occurring in a quasisteady plasma jet formed above a solid target under the action of a neodymium laser pulse, which consisted of quasicontinuous lasing intervals as well as several 'giant' peaks. A plasma-air contact interface was formed and shock waves, created in the plasma by the giant peaks, were reflected from this interface. An analysis of the reflection of shock waves led to a proposal for a new method for plasma diagnostics and measurements were made of the temperature in the jet. Low-threshold optical breakdown of air was observed near the contact surface. (13 refs.)

52.50L Plasma production and heating by shock wave and wire explosion

107419 Conical two dimensional plasma acceleration at resonance absorption. G.W.Kentwell (Dept. of Theoretical Phys., Univ. of New South Wales, Kensington, Australia).
Laser & Part. Beams (GB), vol.1, pt.2, p.107-19 (May 1983).
By employing analytical solutions for the electromagnetic field at resonance absorption, first derived by N.G. Denisov (1957), the total nonlinear force in the plane of incidence has been evaluated. This 2-D force results in a conical type emission towards the vacuum and into the plasma which depends critically on the collision frequency and the density scale length. It is found that, for neodymium glass laser intensities of 10^{14} W/cm^2, keV ions can be produced by nonlinear force acceleration. The analysis is limited by the following requirements: the dielectric constant varies linearly with distance, the angle of incidence is not too small and most importantly self-consistent and transient wave processes occur at a later time and are neglected. (18 refs.)

52.55 PLASMA EQUILIBRIUM AND CONFINEMENT

107420 The effects of low-ionization-potential contaminants on thermal plasmas. D.C.Johnson, E.Pfender (Dept. of Mech. Engng., Univ. of Minnesota, Minneapolis, MN, USA).
Plasma Chem. & Plasma Process. (USA), vol.3, no.2, p.259-73 (June 1983).
Plasmas consisting of a high-ionization-potential component mixed with a low-ionization-potential contaminant are common in industrial processes. Modeling results are presented for a sodium-contaminated nitrogen plasma column operating either in a free-burning (low-temperature) mode or operating in a constricted (high-temperature) mode. At sufficiently high plasma temperatures, the behavior is dominated by the high-ionization-potential component's properties. The low-ionization-potential contaminant's properties determine the low-temperature plasma behavior even when the contaminant is present in relatively small quantities. (5 refs.)

107421 Helical field of JIPP T-II apparatus. T.Sometani (Dept. of Electrical Engng., Faculty of Engng., Shizuoka Univ., Hamamatsu, Japan), S.Tanahashi.
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.960-2 (June 1983).
The measured toroidal helical field of the JIPP T-II apparatus does not vanish on the geometrical axis of the helical winding, contrary to the prediction of the usual theory. The result of measurement can be explained only by an improved theory. On account of the nonvanishing part of the helical field, the magnetic axis of JIPP T-II should be nonplanar and should be shifted on the average inwards with respect to the geometrical axis. (2 refs.)

107422 Development of concentric equipotential surfaces in bumpy torus plasma. K.Takasugi, H.Iguchi, M.Fujiwara, H.Ikegami (Inst. of Plasma Phys., Nagoya Univ., Nagoya, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2389-93 (July 1983).
Radial profiles of the plasma space potential are measured in Nagoya Bumpy Torus (NBT-1) by the use of a heavy ion beam probe. Asymmetric potential profiles owing to toroidal drift are observed in high pressure operation (C-mode). As the pressure is decreased, toroidal plasma is effectively heated (T-mode), poloidal precessional frequency overcomes the electron collision frequency and the equipotential surfaces becomes concentric inside the hot electron ring. (12 refs.)

107423 Stabilizing and destabilizing influence of the Hall effect in a *Z* pinch with a step-like volume current profile. U.Schaper (Inst. fur Theoretische Phys., Univ. Dusseldorf, Dusseldorf, Germany).
J. Plasma Phys. (GB), vol.30, pt.1, p.169-78 (Aug. 1983).
A dispersion relation is derived for axisymmetric perturbations of an infinitely extended circular incompressible *Z* pinch with a step-like volume current profile. This profile is characterized by constant but different volume currents in different regions of the plasma and at the step surface there is a sheet current. The stability boundaries are shifted compared with stability limits in ideal MHD theory. For equilibria with current reversal there is a new stable range. The number of solutions of the dispersion relation depends on the equilibrium. The behaviour of the eigenvalues near the stability boundaries is treated in accordance with bifurcation theory. (7 refs.)

107424 Finite element analysis of the magnetomechanical behavior of a toroidal coil with magnetic mirrors. K.Miya, T.Takagi, T.Takaghi (Nuclear Engng. Res. Lab., Univ. of Tokyo, Ibaraki, Japan).
Nucl. Eng. & Des. (Netherlands), vol.74, no.3, p.339-46 (1982).
A toroidal simulator is used to study the magnetomechanical behavior of a superconducting D-shaped coil set at the center between sectored ferromagnetic plates. Since the magnetic field distribution between the two plates is expected to be almost the same as that created by toroidal field coils arranged in a torus, the toroidal simulator may be expected to show almost the same magnetomechanical behavior as that of the full torus coils. To verify its validity experimentally, buckling and vibration tests were carried out in a liquid helium cryostat. In addition numerical analyses were performed for the magnetic field distribution to reveal its similarity and for the experimental results from the toroidal simulator to confirm its validity. Its validity is fully demonstrated in the present study. (17 refs.)

107425 Modeling TFTR plasma physics. C.E.Singer (Plasma Phys. Lab., Princeton Univ., Princeton, NJ, USA).
Nucl. Eng. & Des. (Netherlands), vol.74, no.3, p.347-65 (1982).
Recent studies of plasma transport and particle trajectories expected in the Tokamak Fusion Test Reactor (TFTR) have been used to assess plasma performance, to plan for experimental operations, and to make decisions on hardware design and allocation of resources. These studies include definition of a standard plasma transport model computing the source of fast neutrons which activate the structure, variation of assumptions concerning plasma confinement and impurity influx, definition of the optimum neutral beam pulse length and beamline orientation, investigation of the effects of different heating profiles investigation of pellet injection, and definition of overall plasma performance and its role in extrapolating TFTR results to design more advanced Tokamak reactors. (25 refs.)

107426 Heat flux on limiters in low-*q* discharges. K.Ioki, M.Nagami, H.Yoshida, H.Yokomizo, M.Shimada, S.Izumi, K.Shinya (Div. of Large Tokamak Development, JAERI, Tokyo, Japan), N.Brooks, T.McMahon, A.Kitsunezaki.
Nucl. Eng. & Des. (Netherlands), vol.74, no.3, p.393-7 (1982).
Heat flux on the Doublet III limiters was measured with an infrared camera and thermocouples during low-*q* discharges. The total heat load to the limiters increases with $1/q_a^*$ in both Dee and circular plasmas. The peak heat flux on the limiters in low-*q* discharges of $q_a^*\approx2$ is ≈2 times higher than that in high-*q* discharges of $q_a^*\approx4$. Since a low-*q* discharge is essential in order to have a high-β Tokamak reactor in the future, higher heat flux on the limiters may be an inevitable problem. It is proposed that the increase in peak heat flux during low-*q* discharges can be reduced by modification of the limiter to an asymmetric shape. (5 refs.)

107427 Enhancement of neoclassical transport coefficients by a poloidal electric field in Tokamaks. C.S.Chang (General Atomic Co., San Diego, CA, USA).
Phys. Fluids (USA), vol.26, no.8, p.2140-9 (Aug. 1983).
The effect of an equilibrium poloidal electric field on the neoclassical transport coefficients is studied in the banana regime, and a significant enhancement (a factor of 2 or more) is obtained for the physically interesting case where the magnitude of the electrostatic potential inhomogeneity is of the same order as the magnetic field inhomogeneity in a Tokamak. (9 refs.)

107428 Direct losses in the ELMO Bumpy Torus experiment. D.E.Hastings, J.D.Callen (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Phys. Fluids (USA), vol.26, no.8, p.2150-60 (Aug. 1983).
For resonant ions in the ELMO Bumpy Torus experiment (EBT), the width of the orbits near the resonance scales like $(\partial\Omega/\partial r)^{-1}$, where Ω is the precessional drift frequency. For $(\partial\Omega/\partial r)\approx0$ over most of the plasma, the ions will drift vertically out of the machine due to the toroidal magnetic field. The problem of these directly lost particles is analyzed by considering collisional diffusion into a hole in velocity space. Particle and energy loss rates including boundary layer corrections due to marginally confined particles are obtained. It is shown that these direct loss rates can be comparable to diffusion rates based on banana transport. (10 refs.)

107429 Particle exchange in the plug of a thermal barrier tandem mirror. P.J.Catto, R.Carrera (Sci. Appls. Inc., Plasma Res. Inst., Boulder, CO, USA).
Phys. Fluids (USA), vol.26, no.8, p.2161-6 (Aug. 1983).
The collisional fluxes of trapped electrons escaping from the plug, and the center cell electrons passing over the thermal barrier and becoming trapped, are evaluated for a simple thermal barrier model appropriate to present tandem mirror experiments. (9 refs.)

107430 Use of the stellarator expansion to investigate plasma equilibrium in stellarators. G.Anania, J.L.Johnson, K.E.Weimer (Plasma Phys. Lab., Princeton Univ., Princeton, NJ, USA).
Phys. Fluids (USA), vol.26, no.8, p.2210-18 (Aug. 1983).
A numerical code utilizing a large-aspect-ratio, small helical-distortion expansion is developed and used to investigate the effect of plasma currents on stellarator equilibrium. Application is made to several existing and proposed stellarators. The modification of the equilibrium properties with pressure is strongly dependent on the vacuum-field configuration. The modular stellarator model which is investigated gives somewhat discouraging results because a large rotational transform, and hence large coil deformation, is needed to achieve high-beta equilibria. (34 refs.)

107431 Interchange stability of an axisymmetric, average minimum-*B* magnetic mirror. J.R.Ferron, A.Y.Wong, G.Dimonte, B.J.Leikind (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
Phys. Fluids (USA), vol.26, no.8, p.2227-33 (Aug. 1983).
An axisymmetric magnetic mirror with large diameter and easily variable mirror ratio is described. The magnetic field configuration is a simple mirror with an average minimum-*B* field region on the outer surface. Experimental results are given which demonstrate that the surface field region ensures interchange stability. Stability can be maintained with both positive and negative radial plasma pressure gradients provided that the product of the pressure gradient and specific flux volume gradient is positive. (17 refs.)

107432 Space potential profiles in ELMO bumpy torus (EBT) experiment. F.M.Bieniosek (McDonnell Douglas Astronautics Co., St. Louis, MO, USA), K.A.Connor.
Phys. Fluids (USA), vol.26, no.8, p.2256-62 (Aug. 1983).
Spatially resolved measurements of the electric space potential in the ELMO Bumpy Torus (EBT) have been made by a heavy ion beam probe. The EBT-I device is characterized by positive potentials in the surface plasma the order of 100 V and by a nearly symmetric potential well in the core plasma of up to 3090 V with respect to the surface potential. The EBT-S device has a similar potential structure with well depth and peak potential similar to or greater than that of EBT-I. Peak potential and well depth increase as the edge gas pressure is lowered and as the microwave power is increased. The potential structure is strongly linked to the specific heating geometry. The ambipolar electric field is large enough generally to dominate the core electron neoclassical diffusion. The potential profile is approximately parabolic in the core, which is shown to be a natural consequence of the spatially uniform plasma source function. (16 refs.)

107433 Thermal magnetic fluctuations and anomalous electron diffusion in a mirror-confined plasma. G.Murtaza, H.U.Rahman (Dept. of Phys., Quaid-i-Azam Univ., Islamabad, Pakistan).
Phys. Rev. A (USA), vol.28, no.3, p.1845-7 (Sept. 1983).
The electron test particle cross-field diffusion due to thermally excited magnetostatic modes with ergodic field lines is investigated. Estimate shows that in mirror-confined plasmas, the electron transport (and hence the electron thermal conduction) caused by the magnetostatic mode exceeds the convective as well as the classical transport. (9 refs.)

107434 Theoretical possibility of confining a dense adiabatic plasma using a self-consistent electrostatic field of subsonic solitons. M.Ya.Ivanov.
Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.240-1 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.387-90 (Feb. 1983). [received: Sept. 1983]
Sagdeev (1964) has pointed out that the hydrodynamic equations of motion describing an isotropic two-temperature plasma admits soliton solutions. These solutions were derived assuming a zero ion temperature, and the ions were assumed to move faster than the characteristic speed of sound. Several experimental studies have recently confirmed the existence of such ion-sound solitons. The authors describe stationary subsonic soliton solutions of a system of hydrodynamic equations governing ion motion using the approximate model of a two-fluid adiabatic plasma in the absence of external fields. At the center of the soliton these solutions imply an infinite potential, particle density, and pressure (the temperature is also infinite if the adiabatic exponent exceeds unity). Because the electric field becomes infinite at the center of the soliton, and infinite negative surface charge density must be introduced for the case of a uniform plasma. For zero ambient velocities these solutions reduce to solitons describing screening of the field of a static negative charge in a dense isotropic plasma. (10 refs.)

107435 Confinement of ions for collision studies. J.B.Hasted (Birkbeck Coll., Univ. of London, London, England).
Physics of Ion-Ion and Electron-Ion Collisions. Proceedings of a NATO Advanced Summer Institute, Baddeck, NS, Canada, 13-26 Sept. 1981 (New York, USA: Plenum 1983), p.461-500
All collision experiments in which individual impacting particles make more than a single trajectory across a significant part of the collision region are in effect confinement situations and will form the subject of the article. This definition excludes collisional orbiting, and also excludes plasma and afterglow studies of collision processes, provided that the mean free path is smaller than the 'significant part' of the collision region which we choose to consider. The author discusses confinement by electric fields, magnetic confinement, the use of steady magnetic and electric fields in conjunction, and confinement in high frequency electromagnetic fields. 52.60 RELATIVISTIC PLASMA

107436 Hydrodynamic description of waves in hot relativistic plasma. L.S.Kuz'menkov, P.A.Polyakov, P.B.Podosenov (Dept. of Theoretical Phys., Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.5, p.12-16 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.5, p.12-17 (1982).
It is shown that using the energy-momentum tensor of material in the form $T^{ij}=(\epsilon+\rho)\tau^i\tau^j-g^{ij}\rho$ with wave emission in a relativistic plasma leads to incorrect dispersion of the plasma waves. A closed system of equations for relativistic plasma is constructed in the hydrodynamic approximation, taking the retardation of the radiation into account, and on this basis the dispersion and radiational-damping decrements of the wave are obtained, with results that do not contradict kinetic theory. (8 refs.)

107437 Transverse modes of a relativistic quantum plasma. C.G.Van Weert, M.C.J.Leermakers (Inst. for Theoretical Phys., Univ. of Amsterdam, Amsterdam, Netherlands).
Phys. Lett. A (Netherlands), vol.97A, no.4, p.159-61 (22 Aug. 1983).
The dispersion relation for long-wavelength transverse plasma waves propagating in a one-component relativistic quantum plasma is derived from the relativistic Boltzmann-Vlasov equation. The result is consistent with the one obtained from quantum electrodynamics by the method of dielectric response, but at variance with hydrodynamical calculations. The discrepancy is explained by making a distinction between collective and collision dominated plasmas. (12 refs.)

52.70 PLASMA DIAGNOSTIC TECHNIQUES AND INSTRUMENTATION

107438 Spatially resolved laser-induced fluorescence and optical emission spectroscopy of carbon tetrachloride glow discharges. R.A.Gottscho, G.P.Davis, R.H.Burton (Bell Labs., Murray Hill, NJ, USA).
Plasma Chem. & Plasma Process. (USA), vol.3, no.2, p.193-218 (June 1983).
The authors describe the use of laser-induced fluorescence and optical emission spectroscopy to study the chemistry of CCl_4 discharges. Spatially and spectrally resolved plasma-induced emission from six different species—CCl, C, Cl, Cl^+, N_2, and $N_2{}^+$—were constrasted with the CCl free radical concentration profile, determined from spatially resolved laser-induced fluorescence, to arrive at a simple model for the CCl_4 discharge chemistry. Electrons appear to be produced at the electrode surfaces by secondary emission resulting from high-energy ion impact. As the electrons are accelerated across the sheath, they are rapidly attenuated by resonant dissociative attachment to CCl_4 and its plasma-generated products. This mode of decomposition produces bright emission nearest to the electrode surfaces and is conducive to the formation of 'glow polymer'. To test the validity of using N_2 as an actinometer in determining the CCl radical concentration, the authors compared laser-induced fluorescence measurements of the CCl concentration with plasma-induced CCl emission normalized to N_2 emission. (59 refs.)

107439 Chemical relaxation study of the heterogeneous silicon-hydrogen system under plasma conditions. J.J.Wagner, S.Veprek (Inst. of Inorganic Chem., Univ. of Zurich, Zurich, Switzerland).
Plasma Chem. & Plasma Process. (USA), vol.3, no.2, p.219-34 (June 1983).
The chemical relaxation technique consists of measuring the response of a chemical system to a small disturbance of an equilibrium or a nonequilibrium steady state. Since, for a small perturbation, the response of any complex and stable system is linear, rate constants of elementary processes under actual plasma conditions can be evaluated directly from the relaxation data. Applications of this technique to the kinetic study of the formation and decomposition of silane are presented and compared with previous data obtained by a flow method. In addition, relaxation data are presented which show that the main reaction channel of silane decomposition in glow discharges is the electron-impact-induced fragmentation into SiH_2 radicals (or ions) and H_2 molecules. (9 refs.)

107440 Decomposition and polymerization of silicon tetrachloride in a microwave plasma. A mass-spectrometry investigation. R.Manory, A.Grill (Materials Engng. Dept., Ben-Gurion Univ. of the Negev, Beer-Sheva, Israel), U.Carmi, R.Avni.
Plasma Chem. & Plasma Process. (USA), vol.3, no.2, p.235-48 (June 1983).
Mass spectrometry has been used to analyze microwave-induced plasmas of silicon tetrachloride diluted in mixtures of hydrogen and argon. The efects of process parameters such as pressure in the reactor, power input, and the composition of the gas mixture were investigated. Sampling by quadrupole mass-spectrometer along the gas stream showed that the reactions were initiated upstream where the reactants enter the plasma. The input power had an optimal value for the decomposition rate of $SiCl_4$; above that optimum, recombination occurred downstream. Upstream the concentrations of $SiCl_4$ decrease with increasing pressure in the range 1-10 torr, independent of the

input power. The effect of admixing argon to the reaction mixture is discussed, and the results obtained are correlated to experimental results reported in previous works concerning silicon deposition from $SiCl_4$ on a grounded substrate. (31 refs.)

107441 Spectroscopic measurements of plasma ion density by neutral beam probing. Y.Ito, S.Fukumoto, S.Goto, T.Ishimura (Plasma Phys. Lab., Faculty of Engng., Osaka Univ., Osaka, Japan).
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.981-6 (June 1983).
A method of determining plasma ion density by spectroscopic measurement of line emission from a probing neutral beam, attenuated by resonance charge transfer interaction with plasma ions, is proposed and tested. A hydrogen plasma produced by an RF discharge was used as the subject of the test. The parameters of the hydrogen probing beam in the region of observations were ~400 eV average energy, $\sim 3\times10^{12}$ cm^{-3} peak density and ~2 μm pulse width. The beam was produced by a Z-pinch-gun, a neutral beam source. From the attenuation rate of Hβ emission and the known cross-section of the interaction, the ion density was determined when it was in the range from 2×10^{14} cm^{-3} to 5×10^{14} cm^{-3}. The value determined agreed well with the electron density measured with an He-Ne laser interferometer. (6 refs.)

107442 An electrodynamic coaxial spectrometer for multichannel plasma pulse analysis. J.Eicher, K.Rohr, H.Weber (Fachbereich Phys., Univ. Kaiserslautern, Kaiserslautern, Germany).
J. Phys. E (GB), vol.16, no.9, p.903-8 (Sept. 1983).
A dynamical particle spectrometer is described, which allows complete and simultaneous analysis of ion energy spectra and charge distributions of transient ion pulses, e.g. from laser-produced plasmas. The system uses a combined time-of-flight arrangement with a coaxial capacitor whose potential is varied as $1/(\text{time})^2$. Compared with dynamically operated parallel plate analysers the cylindrical symmetry offers substantial advantages both in principle and in practical application. A generator was developed which generates the appropriate $1/(\text{time})^2$ deflection potential. The performance of the whole system is tested using laser-produced C plasma pulses. (16 refs.)

107443 Experimental study of high-beta Tokamak stability. M.Machida, G.A.Navratil (Columbia Univ., New York, NY, USA).
Phys. Rev. Lett. (USA), vol.51, no.11, p.992-5 (12 Sept. 1983).
The stability properties of high-beta Tokamak equilibria with $\epsilon\beta_p \gtrsim 1$ and $\langle\beta\rangle$ in the range of 10% have been studied with use of a dual beam CO_2 laser interferometer system. Two equilibria with $\langle\beta\rangle$ of 9% and 13% were observed to be stable. Another equilibrium with $\langle\beta\rangle$ of 10% was observed to be unstable with the characteristics of a high-toroidal-mode-number ballooning mode. (13 refs.)

107444 An interferometric electron density estimate of a TE-CO_2 laser sustained plasma in front of a metallic target. D.Apostol, I.Apostol, D.Barbulescu, M.Dinescu, A.Hening, I.N.Mihailescu, V.Stancalie, M.Stoica (Central Inst. of Phys., Bucharest, Rumania).
Rev. Roum. Phys. (Rumania), vol.28, no.4, p.355-8 (1983).
A Mach-Zehnder interferometer, using a *Q*-switched ruby laser as a light source was constructed. It was used for the investigation of a TE-CO_2 laser produced plasma in front of a solid target. Plasma refractivity analysis indicates an electron density of 10^{18} cm^{-3} on the detonation front. (6 refs.)

107445 The finite collector effect in obtaining the distribution function and temperature of Maxwellian plasmas measured with plane-parallel retarding potential analysers. G.Dinescu, I.Birna, O.Maris (Space Res. Lab., Astron. & Space Sci. Center, Bucharest, Rumania).
Rev. Roum. Phys. (Rumania), vol.28, no.4, p.359-65 (1983).
The finite collector effect is investigated when measuring Maxwellian plasmas with plane-parallel electrostatic analysers. Errors in the distribution function $f(v_z)$ and temperature T, due to the finite collector character, depending on the retarding potential, are estimated for various geometries. The conditions for which plane-parallel analysers measurement results are not relevant are discussed. (4 refs.)

52.75 PLASMA DEVICES AND APPLICATIONS

(see also 28.52 Fusion reactors, 86.30L Electrogasdynamic and magnetohydrodynamic conversion; for ion sources, see 29.25 Particle sources and targets)

107446 Thermionic converter with conductive oxide covered collector. G.Musa, A.Popescu, N.Niculescu (Inst. for Phys. & Technol. of Radiation Devices, Bucharest, Rumania).
Rev. Roum. Phys. (Rumania), vol.28, no.4, p.371-3 (1983).
Preliminary results concerning the behaviour of a thermionic diode with thick conductive oxide covered anode are reported. The obtained values of the anode work function versus T_C/T_R are in good agreement with the published data. (10 refs.)

107447 Analyzer system of the plasma focus ionic component. A.Bocancea (Factory of Nuclear Devices, Bucharest, Rumania), N.Mandache.
Rev. Roum. Phys. (Rumania), vol.28, no.5, p.413-17 (1983).
An analyzer system of protons in the energy range of 1-400 keV used on a plasma focus device is presented in this paper. A combined electrostatic deflection and time of flight technique allows the simultaneous analysis of the protons and impurity ions in different charge states. In the case of a negligible impurity level the energy spectrum of the protons can be obtained on a single discharge. (8 refs.)

107448 Some corrections for a one-dimensional snow-plow model. V.I.Zambreanu (Inst. for Phys. & Technol. of Radiation Devices, Central Inst. for Phys., Bucharest, Rumania).
Rev. Roum. Phys. (Rumania), vol.28, no.5, p.419-24 (1983).
The initial mass of the sheath, the electrical resistance of the discharge circuit, the electrical resistance of the plasma sheath and the snow-plow efficiency are taken into account in a one-dimensional snow-plow model for the run-down phase in a plasma focus device. The numerical results are presented and discussed. (4 refs.)

107449 Emission of electrons from the collector of a thermionic converter. V.N.Sidel'nikov.
Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.238-9 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR),* vol.53, no.2, p.385-7 (Feb. 1983). [received: Sept. 1983]
It has been possible to solve a number of applied problems relating to thermionic converters by numerically solving simplified transport equations. It should be noted that these models neglect arc initiation and constriction and hindered regimes. It was therefore found to be advisable to numerically solve the complete charge, momentum, and energy transport equations for the electrons and ions. (8 refs.)

107450 Predicted behaviour of the pumped limiter of INTOR. M.F.A.Harrison, E.S.Hotston.
Report CLM-R 232, UKAEA, Culham, Abingdon, Oxon., England (1982), 24 pp.
Available from HMSO, London, England.
Modelling of the pumped limiter envisaged for INTOR Phase IIA predicts that an effective exhaust of helium can be attained. Assessment of the performance of tungsten and beryllium limiter plates shows that the sputter rate of tungsten is low and that self-sputtering is not likely to be a problem. Sputter erosion of the beryllium plate is large (≈20cm/year) and the helium exhaust pumping requirements for beryllium are about twice as demanding as those for tungsten. In neither case is there evidence of significant atomic radiation cooling by impurity ions which recycle in the immediate vicinity of the plate. Consideration of the scrape-off plasma provides evidence that localised recycling of DT ions in the immediate vicinity of the limiter is a significant transport mechanism when the scrape-off plasma density is $\gtrsim 10^{19}$ m^{-3}. The charged particle power flow necessary to maintain this recycling is at least 4 MW and, since energy is carried to the sheath predominantly by electron conduction along the magnetic field, there is a substantial temperature gradient between the sheath regions at the limiter plate and the bulk of the scrape-off plasma. The temperature at the separatrix distant from the plate may therefore be in excess of 50 eV. (8 refs.)

107451 Bundle divertor. A review of experimental results. K.B.Axon, J.Burt, S.K.Erents, S.J.Fielding, R.D.Gill, D.H.J.Goodall, M.Hobby, J.Hugill, G.M.McCracken, J.W.M.Paul, N.J.Peacock, B.A.Powell, R.Prentice, G.Proudfoot, G.W.Reid, A.D.Sanderson, P.E.Stott, D.D.R.Summers, C.M.Wilson, A.J.Wootton.
Report CLM-R 235, UKAEA, Culham, Abingdon, Oxon., England (1983), 79 pp.
Available from HMSO, London, England.
The authors review the experimental results obtained with a Tokamak, DITE, operated with a bundle divertor. Experiments to determine the magnetic aperture, exhaust and screening properties of the divertor are described. The results are compared with the predictions of various models. A comparison of the plasma parameters produced with and without the divertor is presented. The differences are discussed in terms of the exhaust and screening properties, with the aid of a global model of impurity production. Neutral hydrogen atom injection has been used to heat the plasma; results are presented, together with a discussion of the effect of the magnetic field ripple, produced by the divertor, on confinement. Gross instability characteristics of plasma produced with the divertor are discussed, together with their effect on the divertor properties. Possible explanations for different operational characteristics are considered. Finally, a comparison between the results obtained with the bundle divertor and poloidal divertors is presented. 107452 Electrodeless breakdown in elliptically polarized fields at 60 Hz. D.E.Friedmann, F.L.Curzon, M.Feeley (Phys. Dept., Univ. of British Columbia, Vancouver, BC, Canada).
Can. J. Phys. (Canada), vol.61, no.9, p.1284-90 (Sept. 1983).
Theoretical and experimental results are presented on the frequency of electrodeless breakdown (f_B) of a gas in a spherical glass bulb immersed in an elliptically polarized field of maximum field strength E_A' and frequency f_A (~60 Hz). It is found that the breakdown threshold is independent of the ellipticity and that graphs of f_B versus E_A' are stepped at low fields and linear at high ones. At high fields, $f_B=f_A l/e_0$ where l is the circumference of the phasor and e_0 is the breakdown strength of the gas ($l=2\pi E_A'$ and $4E_A'$ respectively for circular and linear polarization). The implications of the results for measuring environmental fields are given. (5 refs.)

107453 Experimental study of DC coronas in point-to-plane short gap. Chul-Han Oh, Sung-Man Lee (Korean Inst. of Electrical Engrs., Seoul, Korea).
Trans. Korean Inst. Electr. Eng., vol.32, no.5, p.157-63 (1983). In Korean.
Positive and negative coronas in point-to-plane short gap have been investigated with the variations of point radius and gap length. Mainly the onset potentials and current pulses under various conditions were measured with a 70 MHz CRO and a precise-controllable DC power supply. In the case of negative corona, the Trichel pulse corona, glow corona and spark regions were distinguished apparently and the critical gap lengths between them were also found clearly. In the case of positive corona, there are streamer corona, spark regions and the critical gap length between them, too. The current pulse forms of Trichel pulse corona of negative and streamer pulse corona of positive are similar in rising time, peak-to-peak time and pulse width. The glow corona current shows DC component in form. (8 refs.)

107454 Investigation of changeable discharge colour controlled by electronic circuit. Chul-Han Oh, Duck-Kyu Park (Korean Inst. of Electrical Engrs., Seoul, Korea).

Trans. Korean Inst. Electr. Eng., vol.32, no.5, p.164-9 (1983). In Korean.

A method to control the luminous colour of a gaseous discharge tube has been investigated by using the saw-tooth wave of which rise-time was controlled by an electronic circuit. The luminous colour of a Ne-Hg lamp was changed from red to blue continuously and vice versa, and its luminous characteristics are presented. (11 refs.)

107455 Self-sustaining partial discharges in argon at the dielectric surface. J.S.Brzosko, J.Klobukowska (Inst. of Phys., Warsaw Univ., Warsaw, Poland).

IEEE Trans. Electr. Insul. (USA), vol.EL-18, no.4, p.420-8 (Aug. 1983).

The inception voltage of the surface discharges produced by alternating voltage was measured and mathematically analyzed. The specimen thickness, the dielectric material, and ambient argon pressure were varied. A new definition of the inception voltage is proposed. Analysis is based on the simplified equivalent circuit model, Paschen law, and properties of carriers injected-evaporated from the surface of dielectrics. The results are fairly well interpreted and qualitatively described in terms of the modified Paschen law. (36 refs.)

107456 Effect of electrode geometry on the positive impulse breakdown in carbon dioxide. T.V.Rajendran, C.S.Lakshminarasimha, M.S.Naidu (Dept. of High Voltage Engng., Indian Inst. of Sci., Bangalore, India).

IEEE Trans. Electr. Insul. (USA), vol.EL-18, no.4, p.455-7 (Aug. 1983).

Positive impulse (1.2/50 μs) breakdown voltage measurements were carried out in CO_2 under different electric field conditions of varying the sphere diameter in sphere-plane geometry. CO_2 gas pressures up to 1 MPa were used, with the gap distances varying between 5 and 20 mm. It was observed that there exists a 'critical field' (corresponding to the sphere diameter of 20 mm) at which the breakdown voltage is a maximum over the entire range of pressures investigated. This phenomenon is similar to the corona stabilization effect and could be due to presence of negative ion space charge. (7 refs.)

107457 Experimental study of electrode materials for use in a cold-cathode oxygen discharge. M.G.Dowsett, E.H.C.Parker (Dept. of Phys., City of London Polytech., London, England).

Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.2-3, p.299-309 (1 Sept. 1983).

A large range of elements has been evaluated for use as cathode, anticathode and anode materials in an oxygen cold-cathode discharge. The criterion for suitability of a particular material/electrode combination was based on the ability to extract from the source an ion beam suitable for high dynamic range SIMS. The effect of materials on long and short term stability and total beam current was investigated. The best materials were Al (all electrodes), Ni/Fe (cathode) and Ti (anticathode). Magnesium was totally unsuitable as a cathode material in an oxygen discharge and caused extreme instability in both the extracted beam and the discharge. The reasons for beam current instability are related to departure from cylindrical symmetry in the source, and are discussed qualitatively. (8 refs.)

107458 On the random walk of arc cathode spots in vacuum. E.Hantzsche, B.Juttner, H.Pursch (Central Inst. of Electron Phys., Acad. of Sci., Berlin, Germany), J.E.Daalder.

J. Phys. D (GB), vol.16, no.9, p.L173-9 (14 Sept. 1983).

The theoretical basis of the random walk movement of cathode arc spots is reconsidered, and the probable causes of some discrepancies in measured spot movement parameters and in their interpretation are discussed. (16 refs.)

107459 Axial magnetic field measurements and the stability of a vacuum spark plasma. P.Beiersdorfer, E.J.Clothiaux, G.Bell (Dept. of Phys., Auburn Univ., Auburn, AL, USA).

J. Phys. D (GB), vol.16, no.9, p.1635-42 (14 Sept. 1983).

Axial magnetic fields are measured in the vacuum region surrounding a vacuum spark plasma providing information on the stability of the plasma column. The measurements are correlated to the amount and times of X-ray emission showing that X-ray bursts are produced only in linear discharges. (11 refs.)

107460 A model of the cathode of a thermionic arc. L.E.Cram (CSIRO Div. of Appl. Phys., Lindfield, Sydney, NSW, Australia).

J. Phys. D (GB), vol.16, no.9, p.1643-50 (14 Sept. 1983).

A theoretical model of the cathode of a thermionic arc is presented. Attention is focused on the energy balance of the electrode, with the interplay between the cathode and the arc plasma being described by boundary conditions specified on the electrode surface. Physical processes included in the model are thermal conduction and Joule heating in the electrode, radiative energy exchange between the electrode and the arc plasma, thermionic emission, and ion flow in the cathode sheath. A model of the cathode of a 100 A arc burning on tungsten in argon at atmospheric pressure is described in detail. It is shown that the flow of electric current and heat close to the tip of the electrode is controlled by thermionic emission and arc radiation, while the ion current plays a dominant role in the outer parts of cathode spot. (23 refs.)

107461 Material functions of sulphur hexafluoride. H.Dienemann (Inst. 'Pruffeld fur elektrische Hochleistungstech.', Berlin, Germany).

J. Phys. D (GB), vol.16, no.9, p.1651-71 (14 Sept. 1983).

Several material functions of SF_6 were calculated for temperatures between 1000K and 20000K and for pressures of 0.1, 0.5, 1, 2.5, 5 and 10 MPa. In the basic equations for the computation of SF_6 material functions, the authors have also taken into account plasma nonideality effects. They have analysed the SF_6 plasma radiation in high current discharges using an Optical Multichannel Analyser, to determine the dependence on the current and the discharge pressure. (22 refs.)

107462 Modelling of a low-pressure plasma column sustained by a surface wave. C.M.Ferreira (Lab. de Phys. des Gaz et des Plasmas, Univ. de Paris-Sud, Orsay, France).

J. Phys. D (GB), vol.16, no.9, p.1673-85 (14 Sept. 1983).

A complete theoretical description of a low-pressure, cylindrical plasma column sustained by a weakly damped surface wave is derived in which the equations describing the steady-state plasma maintenance conditions are coupled with the surface wave propagation and attenuation characteristics. The present formulation extends a radial theory of the maintenance of the plasma column previously reported to include the axial variation in the radially averaged plasma properties. Simple similarity laws for this type of discharge are proved to exist under quite general conditions. Analytic expressions are derived for the variation of the electron density along the discharge axis and for the length of the plasma column as a function of the operating parameters. The calculation are shown to agree well with available experimental data. (17 refs.)

107463 Ionisation processes in He-CO and He-CO-O_2 glow discharges. Y.M.Kagan, Y.Kaufman (Center for Plasma Phys., Racah Inst. of Phys., Hebrew Univ. of Jerusalem, Jerusalem, Israel).

J. Phys. D (GB), vol.16, no.9, p.1687-99 (14 Sept. 1983).

Ionisation processes in the He-CO and He-CO-O_2 glow discharges are studied. Various models are critically reviewed and an alternative ionisation mechanism is proposed. The populations of the CO and O_2 metastable levels and the rates of direct and step ionisation processes are calculated. It is argued that the metastable level of CO can be efficiently populated by energy transfer due to collisions between vibrationally excited molecules. It is shown that the direct ionisation of CO in the H-CO discharge is replaced by step ionisation of O_2 in the He-CO-O_2 discharge. This explains both the reduced axial electric field and the fact that O_2^+ is the dominant ion in the He-CO-O_2 discharge. (29 refs.)

107464 Comments on the role of space charges in initiation of electrical breakdown of vacuum gaps. V.A.Nevrovskiy (All-Union Scientific Res. Inst. of Metrological Service, State Committee for Standards, Moscow, USSR).

J. Phys. D (GB), vol.16, no.9, p.1701-4 (14 Sept. 1983).

The process of beam spreading of field-emission electrons under the action of space charges, suggested by Maitland (1961) as an explanation of vacuum breakdown initiation, is analysed. This type of space charge effect is shown to be negligible. A plausible model of breakdown initiation as a result of ions focusing within the electron beam is discussed and shown to be unreal. The effects of space charges on the initiation of vacuum breakdown are thus concluded to be very small. (12 refs.)

107465 Monte Carlo simulation of electrons in the cathode region of the glow discharge in helium. M.Ohuchi, T.Kubota (Dept. of Electronic Engng., Faculty of Engng., Tokyo Denki Univ., Tokyo, Japan).

J. Phys. D (GB), vol.16, no.9, p.1705-14 (14 Sept. 1983).

In the cathode fall region of a glow discharge, where the electric field decreases rapidly with distance from the cathode, parameters for electrons obtained in an equilibrium state can not be correctly used in a theoretical study. In this paper, the cathode region in a normal glow discharge has been analysed by a Monte Carlo simulation. Four types of inelastic collisions together with an elastic collision, the reflection of electrons from electrodes and the back-scattering of electrons to the cathode, were taken into account considering the three-dimensional motions of electrons. Results show that α/p (where α is the ionisation coefficient and p is the gas pressure) is in good agreement with Friedland's result. Also, the mean energy of electrons in the negative glow region was found to be about 11 eV, which is much smaller than previous values. The difference in spatial distribution of optical emission between singlet terms and triplets was also indicated. (28 refs.)

107466 Theoretical study of electron concentration distribution in positive column glow discharge with longitudinal gas stream. R.F.Yunusov (A.N. Tupolev Kazan Inst. of Aviation, Kazan, USSR).

J. Eng. Phys. (USA), vol.43, no.4, p.1100-3 (Oct. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.4, p.585-9 (Oct. 1982). [received: Sept. 1983]

A solution is obtained to the system of equations describing the positive column of a glow discharge in a cylindrical channel with a longitudinal gas stream. Expressions are derived for calculating the electron concentration and the electric field intensity. (8 refs.)

107467 Electrical and thermal structure of the argon arc of a two-jet plasmatron. S.P.Polyakov, V.I.Pechenkin (Dnepropetrovsk Metall. Inst., Dnepropetrovsk, USSR).

J. Eng. Phys. (USA), vol.43, no.5, p.1293-6 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.5, p.833-7 (Nov. 1982). [received: Sept. 1983]

The thermal structure and the distribution of the axial electric field strength of the arc of a two-jet plasmatron were investigated experimentally. (12 refs.)

107468 Investigation of the temporal development of an electrical discharge localized by laser radiation. V.A.Ageev, S.S.Pryakhin, Yu.V.Khlopkov.

J. Appl. Spectrosc. (USA), vol.37, no.5, p.1224-8 (Nov. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.5, p.727-33 (Nov. 1982). [received: Sept. 1983]

A widely used method for increasing the intensity of a spectrum when performing spectral analysis with the use of lasers is to combine the laser with electrical discharge light sources. The simultaneous action of laser radiation with moderate power density and a low-voltage electrical discharge on an electrode together with an increase in the spectral line intensity decreases the size of the damage area in the specimen (localization of the discharge). The results obtained in work in which the discharge was localized by a dielectric plate with an opening apparently suggests that with laser localization of the discharge there is also an intensification of explosive processes removing matter from the surface of the electrode. In this case, the combined action of laser radiation and the electrical discharge on the electrode must decrease the influence of the composition of the specimen on the results of a quantitative determination of its components. In this connection, the authors made high-speed photographs of the flow of erosion products from the surface of electrodes and the spectra of the characteristic emission of the erosion plasma with time resolution of about 1 μsec, obtained using a high-speed photographing setup, and 15 μsec when using a spectrochronograph. The effect of laser localization on the analytic possibilities of the electrical discharge source for exciting spectra was studied for the example of determination of zinc and magnesium in VAL-5 and 85 aluminum alloys of the VNIISO complex. (7 refs.)

107469 Mechanism of formation and decay of some O I levels in the positive column of a glow discharge in O_2. A.I.Maksimov, V.V.Rybkin.

J. Appl. Spectrosc. (USA), vol.37, no.5, p.1233-6 (Nov. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.5, p.738-41 (Nov. 1982). [received: Sept. 1983]

Oxygen atoms in the ground and excited states play an important role in the initiation of plasmachemical processes for which a discharge in O_2 is used. For the determination of atom concentrations in nonequilibrium conditions it is essential to know the specific mechanisms of formation and decay of the corresponding states. The authors give such data for the O I levels $3p^5P$, $5s^5S$, $4d^5D$, $3p^3P$, $5s^3S$, $4d^3D$. (15 refs.)

107470 Role of accelerating processes in the formation of volume nanosecond discharges in dense gases. L.P.Babich, I.A.Berezin, T.V.Loiko, M.D.Tarasov.

Radiophys. & Quantum Electron. (USA), vol.25, no.10, p.807-11 (Oct. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.10, p.1131-7 (Oct. 1982). [received: Sept. 1983]

A spectral and space-time analysis of the luminescence of nanosecond volume discharges in atmospheric density air with large overvoltages is performed. It is shown that the electron temperature near the cathode does not exceed 2 eV, in spite of the high current density ($\sim 10^{-5}$ A.cm^{-2}) and high voltage $U_0 = 100$ kV. The volume nature of the discharges is explained by the fact that charge is transported primarily by runaway electrons. The nature of the electrons with energies $\varepsilon > eU_0$ can be explained by self-acceleration on the front of a polarizing streamer, developing in the near-cathode region of the discharges. (20 refs.)

107471 The extremal nature of the dependence of the formation time of breakdown on the magnetic field strength. M.-R.G.Kishov, A.Z.Efendiev (Dagestansk State Univ., USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.11, p.896-9 (Nov. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.11, p.1256-9 (Nov. 1982). [received: Sept. 1983]
The dependence of the formation time of breakdown τ_ϕ on the magnetic field strength H is investigated. The extremal dependence obtained $\tau_\phi = f(H)$ for the breakdown of helium in an understressed region and the monotonic increase of τ_ϕ as H increases for the breakdown of nitrogen are interpreted on the basis of the model of overlapping avalanches. Optical investigations of the space-time pattern of development of a breakdown in the coarse approximation correspond to the data of the electrical method. (4 refs.)

107472 Increasing efficiency of the mercury-argon discharge at elevated frequency. V.M.Milenin, N.A.Timofeev.
Svetotekhnika (USSR), no.7, p.17 (1983). In Russian.
The calculation of the resonance level 6^3P_1 Hg population in the alternative current discharge with the help of the theoretical model of the positive column are carried out in this work. It is shown that the high energy levels of mercury atom play an important role in increasing the plasma radiation efficiency of the AC discharge with respect to the DC discharge. (5 refs.)

107473 Onset of discharge in vacuum. V.A.Avrutskii (Power Inst., Moscow, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.233-4 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.379-81 (Feb. 1983). [received: Sept. 1983]
The conjecture of Trump and Van de Graf (1947) was analyzed by Avrutskii and Koshchienko (1979) and by Bugarev et al. (1969) to determine a condition for discharge initiation in vacuum and can also be used to account for the parameters of discharges caused by breakdown in vacuum. According to theoretical considerations regarding the exchange mechanism of vacuum breakdown, the ion current i_i reaching the cathode at any time t generates an electron current $i_i\gamma_1$, where γ_1 is the ion-electron emission coefficient. The total current in the discharge circuit is equal to $i(t) = i_i(1+\gamma_1)$. After a time Δt_1 is required for the electrons to drift from the cathode to the anode, the electrons produce an ion current $i_i\gamma_1\gamma_2$ from the anode, where γ_2 is the electron-ion emission coefficient. After a time Δt_2, when the ions have reached the cathode, they give rise to an electron current $i_i\gamma_1^2\gamma_2$ from the cathode, and the total current in the discharge circuit after a time $\Delta t = \Delta t_1 + \Delta t_2$ is equal to $i(t+\Delta t) = i_i\gamma_1\gamma_2(1+\gamma_1) = i(t)\gamma_1\gamma_2$. The author's comparisons reveal fairly good agreement between the experimental and calculated values and confirm the conjecture of Trump and Van de Graaf that an exchange mechanism is involved in vacuum breakdown. (4 refs.)

107474 Theory of low-voltage arcs in an inert gas. V.G.Ivanov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.249-50 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.399-402 (Feb. 1983). [received: Sept. 1983]
A theory of low-voltage arcs in inert gases was worked out by Baksht and Ivanov (1980) and calculations were performed for xenon. The author reports preliminary calculations for low-voltage arcs in argon and neon using the technique of Baksht and Ivanov mention some important features of the calculations. (3 refs.)

107475 Investigation into the time/space behaviour of the cold and the thermal cathode electric arc root. K.Liegmann (Sektion Automatisierungstechnik, Tech. Hochschule Karl-Marx-Stadt, Karl-Marx-Stadt, Germany).
Wiss. Z. Tech. Hochsch. Karl-Marx-Stadt (Germany), vol.25, no.2, p.251-67 (1983). In German.
Arcs of currents under 1 kA at high pressures as well as in vacuum conditions show, depending on discharge, two different types of root. This study is aimed at clarifying conditions which result in this behaviour and to find out how it can be influenced towards one or the other type. Microphotographs show cathode erosion (electrode made of AgPd 30, gap between electrodes 3 μm, spark at 70 V and 2.4 A, duration 0.8 μs) and cathode erosion for similar arc strength. A theoretical model was constructed and theoretical results were compared with those obtained from experiments in which the duration of arc was in the range of nanoseconds. (29 refs.) *G.R.S.*

61.10D Theories of diffraction and scattering

107478 On the theory of X-ray and electron dynamical scattering in crystals with defects. F.N.Chukhovskii (Inst. of Crystallography, Acad. of Sci., Moscow, USSR).
Phys. Met. (GB). Translation of: Metallofizika, Kiev (USSR), vol.4, no.3, p.429-41 (1982). [received: Aug. 1983]
Describes a new approach to the theory of X-ray and electron dynamical scattering based on the 'dispersion surface representation' of dynamical equations. An exact formal solution of the two-wave diffraction scattering problem is constructed with the aid of the scattering matrix (the S-matrix) for which an explicit expression is found. A general formula describing plane-wave diffraction scattering in absorbing crystals in the region of weak distortions is derived, making it possible to determine experimentally the sign of the total variation of the displacement function from the known sign of the mean deviation w of the crystal as a whole from the exact Bragg position. The formation of the diffraction image for a dislocation in a special position, when the dislocation axis is parallel to the diffraction reflection vector, is considered in the quasi-classical approximation. (21 refs.)

107479 Anomalous passage of confined X- and gamma ray beams in three-wave diffraction. A.V.Andreev, V.E.Gorshkov, Yu.A.Il'inskii (Dept. of Quantum Radiophys., Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.6, p.49-54 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.6, p.43-8 (1982).
The authors consider a three-wave dynamical problem of the diffraction of X- and gamma rays in the case of non-coplanar diffraction, when the two reflected waves do not interact directly with each other. Approximate equations are obtained which describe the propagation of confined beams during three-wave diffraction in perfect crystals. The conditions of applicability of plane-wave approximation are estimated, numerical estimates, are presented. (6 refs.)

107480 The application of micro-area X-ray energy dispersive analysis in investigating barium-rare earth fluorocarbonate minerals. Li Fang-hua, Fan Han-jie (Inst. of Phys., Acad. of Sinica, Peking, China), Zhang Pei-shan, Wang Yi-hua.
Acta Phys. Sin. (China), vol.32, no.4, p.460-5 (April 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)* [received: Sept. 1983]
A simple quantitative method for X-ray energy dispersive analysis in investigating barium-rare earth fluorocarbonate minerals is proposed. The reliability of the method has been tested. It is pointed out that the method might be useful in discovering new members belonging to this series of minerals. (8 refs.)

107481 Violations of Friedel's law in real elastically bent crystals. L.I.Datsenko, V.I.Khrupa (Inst. of Semiconductor Studies, Acad. of Sci., Kiev, Ukrainian SSR).
Phys. Met. (GB). Translation of: Metallofizika, Kiev (USSR), vol.4, no.3, p.573-81 (1982). [received: Aug. 1983]
A Bragg-Laue-aligned double-crystal spectrometer (FeKα radiation) was employed to examine the variation of normalized integrated intensities I_{RN} with strain ϵ in real silicon crystals containing a uniformly distributed oxygen or arsenic impurity ($n_0 \sim 10^{18}$ cm^{-3}, $n_{As} \sim 190^{20}$ cm^{-3}), dislocation loops and clusters ($\rho\Sigma = 10^6$ cm^{-3}), produced during the decomposition of a solid oxygen solution in silicon, or edge dislocations ($\rho_d \sim 10^4$ cm^{-2}) with various distribution patterns. Experimental I_{RN} values have been found to agree, within the measurement error (~6%), with those calculated in the framework of the generalized Eikonal theory for perfect crystals in the entire range of ϵ only for specimens which contain uniformly distributed oxygen. On the basis of the data obtained, it has been shown that the deviations from Friedel's law as measured by the Y parameter coincide in the general case in perfect and real crystals only in narrow range of ϵ. (17 refs.)

107482 Evaluation of the efficency of the plan of X-ray experiments in constructing inverse pole figures. S.F.Kurtasov, V.N.Serebryanyi.
Ind. Lab. (USA), vol.48, no.11, p.1100-2 (Nov. 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.11, p.42-4 (Nov. 1982).
A method is described which makes it possible, in addition to constructing the IPFs, to evaluate the efficiency of the plan of textural experiments and identify cases in which the amount of experimental information is insufficient. The experimental data are used to determine the coefficients C_l^μ of expansion of the polar density of the IPF $T(\Phi,\beta)$ into a series of symmetric spherical functions. (4 refs.)

107483 Formation and observation of Moire distribution of X-ray waves in bicrystal interferometers. P.H.Bezirganyan, V.G.Aslanyan (Dept. of Solid State Phys., Erevan State Univ., Erevan, USSR).
Phys. Status Solidi a (Germany), vol.78, no.2, p.415-21 (16 Aug. 1983).
The formation of Moire patterns in twin-block interferometers is investigated. It is shown that it is not possible to observe by the usual methods the Moire patterns produced by the rotations of atomic planes about the axis perpendicular to the reciprocal lattice vector and the plane of scattering. A method to determine the rotations of atomic planes about all three axes and the change in interplanar distances is elaborated upon. (15 refs.)

107484 Sensitivity of plane wave topography to microdefects. R.Kohler, W.Mohling (Zentralinst. fur Elektronenphys., Akad. der Wissenschaften, Berlin, Germany).
Phys. Status Solidi a (Germany), vol.78, no.2, p.489-96 (16 Aug. 1983).
The sensitivity of plane wave topography to microdefects is checked taking oxidation induced stacking faults of 8, 3.5 and 2 μm widths in silicon as a test object. Applying asymmetric CuK_α 440 reflections in Bragg case geometry, 2 μm wide defects generate so well visible contrast that topographic detection of even smaller defects seems possible. Comparison to topographs for different diffraction vectors proves the validity of the $\mathbf{g}_\odot\mathbf{b}$ criterion. Due to the varying penetration of X-rays along the rocking curve it is possible to analyse the depth distribution of defects within a range of several 10 μm below the surface. (11 refs.)

107485 A small system of programs for plotting of powder diffraction patterns. L.Smrcok, D.Miklos (Inst. of Inorganic Chem., Centre of Chem. Res., Slovak Acad. of Sci., Bratislava, Czechoslovakia).
Silikaty (Czechoslovakia), vol.27, no.3, p.281-6 (1983). In Slovak.
A small system of programs to draw the calculated powder patterns written for the desk-top calculator HP9821A is presented. Besides drawing the powder patterns of single phases, patterns of mixtures up to five components can also be plotted. The diffraction shape has been approximated by a modification Lorentz function. (7 refs.)

61.12 NEUTRON DETERMINATION OF STRUCTURES

(for specific determinations, see 61.55 to 61.80)

107486 Neutron spin echo: ten years after. F.Mezei (Inst. Laue-Langevin, Grenoble, France).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.51-60 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The principle of neutron spin echo (NSE) spectroscopy was discovered just 10 years ago—in April 1972 in Budapest—and the first fully fledged NSE spectrometer, IN11, has been in routine user operation since 1978 at the ILL in Grenoble. By now a whole variety of different types of applications have been successfully explored and well established. The resolutions achieved, such as 4 neV in quasielastic scattering and 1 μeV in phonon linewidth studies, represent more than an order of magnitude improvement with respect to other neutron scattering methods. The fundamental conceptual and practical aspects of NSE are considered, together with a few representative experimental examples. (21 refs.)

107487 Features of neutron spectral modulation (NSM) technique. Y.Ito, M.Nishi, K.Motoya (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.61-5 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The neutron spectral modulation (NSM) employs both the sinusoidal modulation of the incident spectral distribution and the pseudo-random time modulation to incorporate the Fourier technique in the spectral domain as well as the impulse response along the time domain. The unique features of the NSM can be summarised in the following two points. The first is the utilisation of the zero-crossing points (ZCP) in the cross-correlated time spectrum as labels for the dispersive scattering process, from which the accurate dispersion relation can be obtained. The width of the dispersion curve is measured in terms of its Fourier transform. The second is the channel Fourier transform scheme, according to which desired frequency components (of both real and imaginary parts) of any scattering function can be obtained. These features of NSM are discussed with examples studied by the PANSI spectrometer. (3 refs.)

107488 Observation of Pendellosung effect in polarised neutron scattering from a magnetic crystal. J.Baruchel (Lab. Louis Neel, CNRS, Univ. Sci. de Medicale Grenoble, Grenoble, France), J.P.Guigay, C.Mazure-Espejo, M.Schlenker, J.Schweizer.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.80 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Summary form only given. The authors have obtained what they believe to be the first experimental evidence, in neutron diffraction from a magnetic crystal, of the Pendellosung effect predicted by a dynamical theory. They measured the flipping ratio $R=I_+/I_-$ for polarised neutrons as a function of wavelength for the 220 reflection from a carefully selected single crystal of yttrium iron garnet (YIG) in which the main crystal defects, the growth striations, were parallel to the (112) surface of the 0.48 mm thick sample and therefore inoperative in the symmetrical Laue geometry used. By using wavelength between 0.4 and 1.1 Å, they obtained a characteristic oscillating behaviour of $R(\lambda)$, which can be related to the oscillations expected for $I_+(\lambda)$ and $I_-(\lambda)$ in the simple case they chose, where the magnetisation, saturated along [111], was perpendicular to the scattering vector. The measured period is not in conflict with the structure factors found via extinction corrections to the kinematical scattering approximation by Bonnet et al. (1979). (3 refs.)

107489 An application of wide band chopper for small angle neutron scattering. M.Ono, H.Yoshida, S.Okamoto (Res. Reactor Inst., Kyoto Univ., Osaka-fu, Japan), K.Osamura, H.Tsunekawa.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.91-5 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
A wide band chopper was designed to provide polychromatic pulsed neutrons in the range 2-10 Å for small angle neutron scattering (SANS), and has been installed at Kyoto University Research Reactor. In the SANS by means of the time-of-flight technique with this chopper, scattering patterns are provided in the range of the scattering vector κ from 0.01 to 0.1 $Å^{-1}$. The shape of the slit of the rotor was determined after computer calculations of neutron burst shapes and transmission probabilities for various slit shapes. The experimental tests for the rotor have satisfactorily been performed. A practical application of the chopper to SANS was carried out to examine the precipitation in a superconducting composite wire of Ti-Nb alloy during ageing at 643K. (1 ref.)

107490 Neutron diffraction camera method applied in the study of phase transition. M.Hidaka (Dept. of Phys., Kyushu Univ., Fukuoka, Japan), A.F.Wright, S.P.Heathman.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.103 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Summary form only given. The neutron diffraction camera method is used for studying the crystallographic and magnetic phase transitions. Since this method shows a two-dimensional view of the reciprocal space at the same time, it is very useful for observing the pattern of satellite reflections or diffuse scatterings related to any kind of structural phase transitions. And also, since the instrument used is a Laue camera, an oscillating camera and a Weissenberg camera constructed for neutron diffraction, it is possible to determine crystallographic and magnetic structures as by an X-ray diffraction camera method. 107491 Simple analytical method of determining the positions of traces in electron-diffraction patterns. E.I.Teitel' (Inst. of Metal Phys., Sverdlovsk, USSR).
Ind. Lab. (USA), vol.48, no.11, p.1122-3 (Nov. 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.11, p.57-8 (Nov. 1982). (3 refs.)

107492 Some applications of convergent beam electron diffraction in metallurgical research. M.Raghavan, J.Y.Koo, R.Petkovic-Luton (Corporate Res. Sci. Labs., Exxon Res. & Engng. Co., Linden, NJ, USA).
J. Met. (USA), vol.35, no.6, p.44-50 (June 1983).
Crystal structure characterization of materials at very high spatial resolution by convergent beam electron diffraction (CBD) analysis has been receiving increasing attention since the advent of the modern probe forming electron microscopes. The combination of a fine probe and a high diffraction angle in CBD provides, among others, three-dimensional crystal structure and symmetry information from very small regions or second phase particles. Such information is essential to unambiguously determine the crystal structure of complex phases. The authors describe the basic principles of CBD and illustrate how the technique has been routinely and effectively used in the analysis of second phase particles in nickel-base and oxide dispersion strengthened alloys. (16 refs.)

107493 Structure-factor phase information from two-beam electron diffraction. J.Tafto (Metall. & Materials Sci. Div., Brookhaven Nat. Lab., Upton, NY, USA).
Phys. Rev. Lett. (USA), vol.51, no.8, p.654-7 (22 Aug. 1983).
The electron-induced characteristic X-ray emission from a noncentrosymmetric crystal shows a pronounced intensity difference when the Bragg condition is fulfilled for the G and $-G$ reflections, respectively, along a polar direction. This two-beam effect is demonstrated for GaAs and InP, and is a direct method of obtaining information about the phase of a structure factor and determining the sense of a polar direction. (14 refs.)

Extinction-contour method in examining bending in thin-film objects [electron microscopy] .... See Entry 107499

61.14H Low-energy electron diffraction (LEED) and reflection High-energy electron diffraction (RHEED)

107494 Application of orthogonal experimental design to LEED crystallography. W.S.Yang (Dept. of Phys., Peking Univ., Beijing, China), F.Jona, P.M.Marcus.
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.718-22 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
A description is given of the first application to LEED crystallographic problems of an optimization scheme called orthogonal experimental design (OED) which economizes on selection of trial values. The operational procedures required by the OED method are described, and their use in a LEED intensity analysis of the Si{001}2×1 surface is discussed. This first application to what is undoubtedly one of the most difficult problems in quantitative LEED crystallography was an essential ingredient in finding a satisfactory set of structural parameters for the Si{001}2×1 surface. (11 refs.)

107495 Determination of the incidence and azimuth angles in LEED experiments. S.Mroz (Inst. of Experimental Phys., Univ. of Wroclaw, Wroclaw, Poland), A.Grudniewski, E.Bak.
J. Phys. E (GB), vol.16, no.9, p.858-61 (Sept. 1983).
A method of measuring the incidence angle β and azimuth angle ϕ in LEED experiments is proposed. The sample is positioned in such a manner that, after rotation through the angle δ around the axis parallel to the sample surface, the (hk) beam occupies the place on the luminescent screen occupied by the (00) beam before this rotation. If the basic vectors of the surface structure are known, the angle β can be calculated using the angle δ and electron energy E. The angle ϕ is also known because the projection of the primary beam on the sample surface is parallel to the vector (hk) of the two-dimensional reciprocal lattice. The sources of error are discussed and the total error in single measurement of both β and δ is estimated to be not larger than 1°. The advantages of the method proposed is that one obtains the actual values of angles measured even in the presence of magnetic fields. (2 refs.)

107496 Equivalent beam averaging (EBA) of I-V spectra for LEED analysis. H.L.Davis, J.R.Noonan (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Phys. Scr. (Sweden), vol.T4, p.141-3 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).
An equivalent beam averaging (EBA) procedure is described which has proved to be very useful to enhance *I-V* profile data collected for LEED analyses. Specific analyses are documented where application of EBA has led to improved agreement between calculated and experimental *I-V* profiles. The procedure also has been substantiated by examination of representative *I-V* profiles which were calculated to correspond to the incident beam slightly misaligned from, and exactly aligned with, the surface normal. It then has been inferred from such substantiation that use of EBA in LEED analysis reduces the effects of systematic experimental errors caused by minor misalignment of the incident beam, beam divergence, and certain surface morphologies. (10 refs.)

107497 'Nonsystematic' many-beam interactions in high-energy electron diffraction. A.S.Avilov, V.S.Parmon (Inst. of Crystallography, Acad. of Sci., USSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.2, p.224-5 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.383-4 (March-April 1983). [received: Sept. 1983]
When fast electrons are diffracted by a thin single crystal layer, reflections may arise due to 'random' incidences on the Ewald sphere. In this case one obtains the so-called 'nonsystematic' many-beam interactions. Thus it is important to allow for these reflections in many-beam dynamic calculations of the reflected intensities in electron diffraction. The use of a scattering matrix for crystallites of different thicknesses arbitrarily oriented relative to the incident beam, together with a knowledge of the law of distribution of the crystallites in the specimen with respect to thicknesses and orientations, enables the authors to make an approximate calculation of the reflected intensities for diffraction of electrons in the many-beam case. The scattered intensity from such a specimen is the sum of the intensities due to the separate groups of crystallites with given thickness and orientation. (5 refs.)

107498 Reconstruction of the shape of small particles. S.A.Napiiko, A.P.Ostranitsa (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1507-10 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.172-5 (Nov.-Dec. 1982).
A method is described for reconstructing the shape of small particles by using interference electron microscopy. The curvature of the fringes in the interference pattern is proportional to the dimension of the object in the direction of the electron beam. A crystalline particle of molybdenum oxide MoO_3 reconstructed in this way had the shape of an octahedron and the value of its average internal potential was $U_{MoO_3}=9.6\pm0.5$ V. (9 refs.)

107499 Extinction-contour method in examining bending in thin-film objects [electron microscopy]. I.E.Bolotov, V.Yu.Kolosov (Sverdlovsk Economics Inst., Sverdlovsk, USSR).
Ind. Lab. (USA), vol.48, no.11, p.1117-22 (Nov. 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.11, p.53-7 (Nov. 1982).
Quantitative relationships are derived between the positions of the contours and the crystallography, bending, and orientation of the object, and the scope for using these contours in examining lattice bending is shown. Results are illustrated for hexagonal selenium and tellurium growing in thin-film vacuum condensates of amorphous Se-Te and Cu-Te products. (7 refs.)

107500 Structure study of lead oxides used as precursors of lead zirconate-titanate sintering process. F.Constantinescu, I.Zbera, F.Craciun (Inst. of Phys. & Technol. of Materials, Bucharest, Rumania).
Rev. Roum. Phys. (Rumania), vol.28, no.5, p.459-61 (1983).
The morphology and phase composition of the lead oxides obtained in different physico-chemical conditions were studied by transmission electron microscopy and diffraction. A survey of the microstructure characteristics was realized, taking into account their importance for the ulterior behaviour of these materials in the PZT powder sintering process. (1 ref.)

107501 UHV-SEM studies of surface processes: recent progress. J.A.Venables, G.D.T.Spiller, D.J.Fathers, C.J.Harland, M.Hanbucken (School of Math. & Phys. Sci., Univ. of Sussex, Brighton, England).
Ultramicroscopy (Netherlands), vol.11, no.2-3, p.149-55 (1983). (Surface Imaging and Analysis with High Spatial Resolution, Wickenburg Inn, AZ, USA, 12-15 Jan. 1983).
Surface processes on bulk samples have been studied using an ultra high vacuum SEM, equipped with a variety of surface-sensitive techniques. Recent studies of Stranski-Krastanov growth systems and the uses of a recently installed computerised data acquisition system are highlighted. (20 refs.)

107502 On the measurement of surface step heights by low-loss imaging in STEM. M.M.J.Treacy (Exxon Res. & Engng. Co., Corp. Res.—Sci. Labs., Linden, NJ, USA), J.Bellessa.
Ultramicroscopy (Netherlands), vol.11, no.2-3, p.173-8 (1983). (Surface Imaging and Analysis with High Spatial Resolution, Wickenburg Inn, AZ, USA, 12-15 Jan. 1983).
The use of a sector magnet spectrometer as a low-energy-loss electron detector for surface imaging in the scanning transmission electron microscopy (STEM) is described. It is shown that analysis of image contrast as a function of electron energy loss allows surface step heights down to about 1 nm to be estimated. (16 refs.)

61.20 CLASSICAL, SEMICLASSICAL, AND QUANTUM THEORIES OF LIQUID STRUCTURE

(for kinetic and transport theory, see 51.10; for electronic states, see 71.; for liquid helium, see 67.)

107503 Vibrational relaxation in liquids: quantum states in a classical bath. D.W.Oxtoby (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA).
J. Phys. Chem. (USA), vol.87, no.16, p.3028-33 (4 Aug. 1983).
Vibrational motion in liquids is highly quantum mechanical: distinct vibrational quantum states are clearly seen and can usually be identified with the corresponding quantum states for molecules in the gas phase. The relaxation of these states occurs through coupling to a bath of rotational and translational degrees of freedom, which can be described through classical mechanics. The author outlines some promising new theoretical approaches to vibrational phase and energy relaxation in liquids and shows their relationship to experimentally determine vibrational line shapes and population relaxation rates. He focuses particularly on the qualitatively new types of behaviors that result when the time scales for vibrational and bath relaxation become comparable. (38 refs.)

107504 Study of multiatomic molecular interaction potentials in liquids using perturbation theory. I. Calculation method and comparison of results with Lennard-Jones potential. D.A.Tolstunov (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
J. Eng. Phys. (USA), vol.43, no.5, p.1263-7 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.5, p.798-803 (Nov. 1982). [received: Sept. 1983]
An algorithm is presented for calculation of the thermodynamic properties of a liquid whose molecules interact in accordance with a specified model potential, using the methods of perturbation theory. (19 refs.)

107505 Exact equations and the theory of liquids. V. G.A.Martynov (Inst. of Phys. Chem., Acad. of Sci., Moscow, USSR), G.N.Sarkisov.
Mol. Phys. (GB), vol.49, no.6, p.1495-504 (20 Aug. 1983).
The exact equations for the unitary and binary distribution functions derived by Martynov (1981) contain infinite functionals $M^{(i)}$, $i=1$, 2, whose calculation encounters considerable difficulties. These equations cannot therefore find practical application. A method has been suggested for an approximation of these functionals. Even in the first approximation, this method leads to an equation which enables the pressure in a system of high-density hard spheres to be calculated with an accuracy ten times higher than that of the Percus-Yevick equation and 25 times higher than the accuracy of the HNC equation. (6 refs.)

107506 Extension of the square-gradient theory to fourth order. R.F.Kayser, H.J.Raveche (Thermophys. Div., NBS, Washington, DC, USA).
Physica A (Netherlands), vol.120A, no.1-2, p.68-76 (1983).
In the square-gradient theory, the Helmholtz free energy density of a nonuniform fluid is approximated by that of a uniform fluid plus a term proportional to the square of the density gradient. Presented here is the extension of this theory (and the corresponding theory of the chemical potential) to fourth order in the gradients. The new results can be applied to study the pair correlation function and interfacial density profile in a fluid near its critical point. (14 refs.)

107507 Calculation of correlation functions of hard spheres in the generalized mean spherical approximation. B.B.Deo, A.C.Naik (Dept. of Phys., Utakal Univ., Bhubaneswar, Orissa, India).
Phys. Rev. A (USA), vol.28, no.3, p.1700-8 (Sept. 1983).
Wiener-Hopf factorization technique as suggested by Baxter (1965) has been used to solve the Ornstein-Zernike equation for a system of hard spheres in the framework of a generalized mean spherical model. The method reported yields unambiguous and accurate values of the radial distribution function $g(r)$, direct correlation function $C(r)$, and the structure function $S(k)$. These thermodynamic quantities have been calculated from low to fairly high densities and, with a normalized $g(R)$, they have been compared with the molecular-dynamics values of Alder and Hecht (1968). (22 refs.)

107508 Structure of polymer solutions: scaling and modelling on an electronic computer. T.M.Birshtein, A.M.Skvortsov, A.A.Sariban (Inst. of Macromolecular Compounds, Acad. of Sci., Leningrad, USSR).
Polymer (GB), vol.24, no.9, p.1145-54 (Sept. 1983).
The computer simulation method has been used to examine the equilibrium characteristics of flexible-chain concentrations in model lattices in θ solvents and good solvents. The mean square radius of inertia, and the radial distribution functions of density of the units around an isolated (average) unit and around the centre of gravity of an arbitrary isolated chain have been calculated. The results of a 'computer experiment' have been compared with those predicted by scaling theory. In general 'experimental' results are in good agreement with the formulae of scaling theory and with the picture of the 'blob' concept. (26 refs.)

107509 Investigation of two-component liquid solutions with the aid of the modified Percus-Yevick equation. D.K.Belashchenko.
Russ. Metall. (GB), no.1, p.29-34 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.1, p.29-38 (1982).
Partial structure factors and pair atom radial-distribution functions in binary solutions with a different type of deviation from the ideal are calculated using the modified Percus-Yevick equation. The effects were detected of preferential surrounding of a given atom by particles of the same or the other component, depending on the ratio of the corresponding pair of interatomic potentials. Thermodynamic properties of binary systems are calculated. Strong positive and negative deviations from ideality can be obtained even with the use of purely repulsive interatomic potentials. However, the excess entropy of mixing of the solutions is almost zero. The excess ΔH_{mix} and ΔG_{free} are due mainly to the volume change on mixing. (7 refs.)

107510 Modification of the Percus-Yevick equation for describing dense liquids. D.K.Belashchenko, V.P.Efanova, V.A.Khromusin.
Russ. Metall. (GB), no.2, p.46-53 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.2, p.50-7 (1982).
The introduction of correcting terms into the Percus-Yevick equation gives considerably improved calculated values of the thermodynamic properties and structural characteristics of a system with purely repulsive potentials of type $\phi(f)=a/r^{12}$ and a system of hard spheres. For a system with a Lennard-Jones potential, the modified PY equation gives improved agreement with the Monte Carlo data for the radial distribution function but not for the thermodynamic properties. The procedure proposed by Belashchenko et al. (see ibid., no.1, p.51, 1981) for determining the slope of the repulsive part of the interatomic potential in liquid metals hardly differs on going from the PY to the MPY equation. (15 refs.)

107511 Thermodynamics and quantum corrections from molecular dynamics for liquid water. P.H.Berens, D.H.J.Mackay, G.M.White, K.R.Wilson (Dept. of Chem., Univ. of California-San Diego, La Jolla, CA, USA).
J. Chem. Phys. (USA), vol.79, no.5, p.2375-89 (1 Sept. 1983).
In principle, given the potential energy function, the values of thermodynamic variables can be computed from statistical mechanics for a system of molecules. In practice for the liquid state, two barriers must be overcome. The paper treats the first problem, how to quantum correct the classical mechanical thermodynamic values available from molecular dynamics, Monte Carlo, perturbation, or integral methods in order to compare with experimental quantum reality. A simple technique, derived from spectral analysis of the atomic velocity time histories, is presented for the frequency domain quantum correction of classical thermodynamic values. This technique is based on the approximation that potential anharmonicities mainly affect the lower frequencies in the velocity spectrum where the system behaves essentially classically, while the higher spectral frequencies, where the deviation from classical mechanics is most pronounced, involve sufficiently harmonic atomic motions that harmonic quantum corrections apply. Thus, a harmonic quantum correction can be applied at all frequencies: at low frequencies where it is inaccurate it will be small, while at high frequencies where it is large it will also be relatively accurate. The approach is demonstrated by computation of the energy and constant volume heat capacity for water from classical molecular dynamics followed by quantum correction. The potential used to describe the interactions of the system of water molecules includes internal vibrational degrees of freedom and thus strong quantum effects. Comparison of the quantum corrected theoretical values with experimental measurements shows good agreement. The quantum corrections to classical thermodynamics (which are also derived for free energy and entropy) are shown to be important not only for internal vibrational motion, but also for intermolecular hindered rotational and translational motions in liquid water. The approach allows the calculation of thermodynamic quantum corrections for liquids, solutions, and large molecules such as polymers (including proteins and nucleic acids) with full inclusion of both intra- and intermolecular degrees of freedom. (123 refs.)

107512 A cluster theory for electrolytes. A.Tani, D.Henderson (IBM Res. Lab., San Jose, CA, USA).
J. Chem. Phys. (USA), vol.79, no.5, p.2390-4 (1 Sept. 1983).
A simple extension of the Bjerrum theory is formulated and examined. Clusters of trimers as well as dimers are included. The intercluster partition function is evaluated in the mean spherical approximation. At low concentrations this cluster theory gives good results for the thermodynamic functions and for the radial distribution function for unlike pairs. The radial distribution function for like pairs is less satisfactory. The theory is less successful at higher concentrations but is always at least as good as the mean spherical approximation. (9 refs.)

107513 A test of an effective pair potential for liquid water. M.Townsend, S.A.Rice (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA), M.D.Morse.
J. Chem. Phys. (USA), vol.79, no.5, p.2496-8 (1 Sept. 1983).
In previous works the authors have examined the predicted ice structures for a variety of water-water effective pair potentials (1981, 1982). They have determined that the potential of Matsuoka, Clementi, and Yoshimine (1976) (given in their paper under the heading ϵ_{CI}) is generally the most successful in predicting the 0-0-0 angles and hydrogen bonding topology of the various proton-ordered ice structures, but that is overestimates the volume of the unit cell by 20% or more. Subsequent to this work, they learned that most simulations of liquid water and solutions utilize another version of the MCY potential, listed by Matsuoka, Clementi, and Yoshimine under the heading ϵ_{inter} report a comparison of the ice VIII structure supported by this potential to those supported by other models and to experimental data. (15 refs.)

107514 Compensation point in semi-dilute polymer solutions as observed by SANS. K.Okano (Dept. of Appl. Phys., Univ. of Tokyo, Tokyo, Japan), K.Kurita, S.Nakajima, E.Wada, M.Furusaka, Y.Ishikawa.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.413-17 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The angular dependence of the intensity of SANS by semi-dulute solutions of polystyrene in deuterated cyclohexane near θ temperature was measured in order to determine the density-density correlation function of polymer segments. The concentration dependence of the measured screening length was analyzed based on a simple statistical theory in which only the contributions of the diagrams of chain type are taken into account. This theory enables the authors to obtain separately the binary and ternary cluster integrals of polymer segments for each temperature. It was found that the binary cluster integral changes its sign at about 40°C, the θ temperature, whereas the ternary cluster integral is almost independent of temperature near the θ point. Slightly below the θ temperature there occurred, for each concentration, a compensation point at which polymer coils become ideal due to the opposite contribution of the two cluster integrals. (10 refs.)

107515 Small-angle neutron scattering of polymer solutions. R.Koyama (Phys. Lab., Coll. of General Education, Kyoto Univ., Kyoto, Japan).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.418-21 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The angular dependence of the small-angle scattering of concentrated polymer solutions is calculated, using a random coil polymer model consisting of rod-like segments. A Gaussian radial distribution function of the segments is assumed, considering that the local segment density in the solution is almost constant in high concentration. When the segment interaction is weak, the scattering intensity becomes a monotonically decreasing function of the scattering angle. But when the interaction is sufficiently strong, it has a maximum. This maximum point is proportional to the square root of the polymer concentration. This is in agreement with a recent small-angle neutron scattering experiment on polyelectrolyte solutions. Assuming suitable values of the interaction parameters of the segment, a quantitative comparison of the calculated maximum points with the experimental values is made, and from this the segment length and the average end-to-end distance of this polyelectrolyte molecule are determined. (7 refs.)

107516 Neutron quasielastic scattering studies of molecular liquids and polymers by pulsed cold neutron source. K.Inoue (Dept. of Nuclear Engng., Hokkaido Univ., Sapporo, Japan), Y.Kiyanagi, M.Kohgi, K.Kaji.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.422-5 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The authors have developed a neutron quasielastic scattering spectrometer with conventional energy resolution. The spectrometer operates at the spallation cold neutron source in the KENS spallation source at the National Laboratory for High Energy Physics. High efficiency was achieved by adopting large analyser mirrors and the spallation cold neutron source. The spectrometer has demonstrated considerable usefulness in spectral profile analysis studies of molecular liquids and polymers. (7 refs.)

107517 Gelation models of hydrogen bond networks in liquid water. H.E.Stanley, R.L.Blumberg (Dept. of Phys., Boston Univ., Boston, MA, USA), A.Geiger.
Phys. Rev. B (USA), vol.28, no.3, p.1626-9 (1 Aug. 1983).
Cluster statistics of hydrogen bonds networks in water are calculated with the use of molecular dynamics (MD) and are compared with the predictions of gelation models. For small bond networks the MD calculations agree well with Flory theory (which neglects cycles), but they disagree for the larger networks. The MD data for the connectivity of the larger networks agree much better with the authors' ice lattice calculations, providing the first MD test of the ability of Flory theory to describe polyfunctional condensation network statistics. (13 refs.)

107518 Molecular structure and physical properties of rigid polymers in solutions. V.N.Tsvetkov.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.8, p.1571-86 (Aug. 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
The results of experimental studies of physical properties of molecules of rigid polymers obtained with the aid of measurements of translational friction, viscosity, dynamic and electrical birefringence in solution are summarized. The main results of theories of hydrodynamic properties and optical anisotropy of chain molecules as well as dynamooptic and electrooptic effects in stationary and dynamic regimes are discussed. Conformational, hydrodynamic, optic and dipole characteristics of rigid molecules are compared with corresponding properties of flexible molecules. (31 refs.)

107519 On structure of liquid polyethylene. 'Computer experiment' and IR-spectroscopy data. P.G.Khalatur, P.M.Pakhomov, A.S.Pavlov.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.8, p.1667-73 (Aug. 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
The equilibrium characteristics of systems consisting of many interacting PE chains have been studied by the Monte Carlo method. The dependence of mean-square radii of gyration of chains on the density of units in the system attaining 0.72 of the density of the melt was calculated. The conformational composition of PE macromolecules in the liquid state was studied by Monte Carlo and IR-spectroscopy methods. The average dimensions and local structural characteristics of PE chains were shown to be the same as for isolated chains in θ-conditions. No proofs of existence of long intramolecular folds were obtained. The results of the calculation of conformational composition and average dimensions of chains coincide with experimental data. (36 refs.)

61.25M Liquid metals

107520 Concentration dependence of the heat of formation of binary liquid alloys. L.J.Gallego (Dept. de Fisica Fundamental, Univ. de Santiago de Compostela, La Coruna, Spain), J.M.Lopez, J.A.Alonso.
Physica B & C (Netherlands), vol.122B+C, no.1, p.23-7 (Sept. 1983).
A link is established between Miedema's work (1973-80) on heats of formation of metallic alloys and a theory of mixtures that is essentially a version of Guggenheim's quasichemical model (1952) in terms of contact surface interactions. The theory in question, which has been developed by Kehiaian (1978) and applied to organic mixtures, allows a rational derivation of the dependence of the heat of formation of liquid alloys on their composition. The interchange energy, which appears in this theory as a parameter to be fixed experimentally, can be obtained through Miedema's treatment in terms of the electronegativities and the boundary electron densities of the pure metals. (11 refs.)

107521 Neutron multiple scattering on cylindrical samples, diffraction experiments. I.Padureanu, S.Rapeanu, V.Filip, G.Rotarescu, C.Craciun (Inst. for Nuclear Power Reactors, Pitesti, Rumania).
Rev. Roum. Phys. (Rumania), vol.28, no.5, p.431-8 (1983).
The multiple scattering of nuetrons on cylindrical samples is calculated for the case of diffraction experiments on liquid metals. As the majority of the liquid metals are coherent scatterers, the angular distribution of the scattered neutron intensity is not isotropic and this is taken into account. A general formulation of the various scattering orders is given. The calculations are performed for liquid gallium and bismuth up to the fourth scattering order. It is concluded that the ratio of the second order scattered intensity to the first order one strongly depends on the scattering angle, especially in the region of the small angles. (19 refs.)

61.30 LIQUID CRYSTALS

(see also 64.70M Transitions in liquid crystals)

107522 Chiral SmC* liquid crystals obtained by mixing of SmC and cholesteric phase. J.Pavel, M.Glogarova, D.Demus, A.Madicke, G.Pelzl (Inst. of Phys., Czechoslovak Acad. Sci., Prague, Czechoslovakia).
Cryst. Res. & Technol. (Germany), vol.18, no.7, p.915-21 (1983).
The binary mixtures of a substance providing SmC phase and a substance providing cholesteric phase exhibit a chiral SmC* phase for certain concentration and temperature range. This phase was verified to be ferroelectric. The temperature dependences of the spontaneous polarisation and the coercive field were determined for three concentrations. The pitch of the helical structure is approximately indirectly proportional to the molar concentration of the cholesteric substance and varies from 3 μm to about 25 μm in the concentration range from 20 mol% to 5 mol% of the cholesteric substance. For the lower concentrations the sample is unwound in planar samples due to the surface anchoring. Two possible unwound planar configurations can be switched by electric field. (14 refs.)

107523 Discontinuous Freedericksz transition in the smectic C phase. P.Schiller, G.Pelzl (Sektion Chemie, Martin-Luther-Univ., Halle-Wittenberg, Germany).
Cryst. Res. & Technol. (Germany), vol.18, no.7, p.923-31 (1983).
The threshold field of the Freedericksz transition in planar oriented S_C monocrystals possessing positive dielectric anisotropy is calculated for two boundary conditions. It is shown that the threshold field is relatively low when a discontinuous transition is taken into consideration. The effective elastic constant is determined from the experimental data. (11 refs.)

107524 Field dependence of helicoidal pitch and its phenomenological theory. S.Kai, M.Takata, K.Hirakawa (Dept. of Electronics, Kyushu Univ., Fukuoka, Japan).
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.938-41 (June 1983).
The field dependence of the helicoidal pitch in the ferroelectric liquid crystal DOBAMBC is studied. Divergence of the pitch is observed at a certain critical field, and two critical fields exist when the field is varied up and down. The dependence of both critical fields on temperature is also obtained experimentally, but the ratio of the critical fields, 3/2, is almost independent of temperature. The Landau expansion of the free energy involving a helicoidal structure is used to interpret the experimental results. (15 refs.)

107525 Anisotropic excluded volume effect and alignment of nematic liquid crystal in a sandwich cell. K.Okano (Dept. of Appl. Phys., Univ. of Tokyo, Tokyo, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.6, p.L343-4 (June 1983).
It is shown that the orientation dependent excluded volume interaction between elongated nematic molecules and the cell walls always favors the planar alignment of nematic liquid crystals. For thermotropic liquid crystals the anchoring energy of this effect amounts to several erg/cm^2. (8 refs.)

107526 Temperature dependence of the Maier-Saupe order matrix from ^{2}H-NMR of fluorene-d_{10} in the nematic, smectic A, B, and C phases. N.A.P.Vaz, J.W.Doane (Dept. of Phys., Kent State Univ., Kent, OH, USA).
J. Chem. Phys. (USA), vol.79, no.5, p.2470-7 (1 Sept. 1983).
From ^{2}H-NMR of perdeuterated fluorene (diphenylenemethane-d_{10}) dissolved in 4-n-butyloxybenzylidene-4-n-octylaniline (4O.8) and in a mixture of 4O.8 with 4.4′-bis-n-heptyloxyazoxybenzene (HOAB, 15.1 wt.%) the authors have measured each of the orientational order parameters of the Maier-Saupe order matrix and their temperature dependence in the nematic, smectic A, smectic B, and smectic C phases, respectively. The fluorene-d_{10} molecule, being a rigid structure of known conformation and one which contains a sufficient number of differently oriented deuterated sites, allows for the complete determination of the order matrix in terms of the measured ^{2}H-NMR spectral splittings. The results show: (1) The principal molecular z axis (most ordered axis) is parallel to a direction which joins the centers of the six membered rings at all temperatures and in each phase studied; (2) nonlinearities are present in the temperature dependence of the ratios of the splittings and are a result of the temperature dependence of the elements of the order matrix, S_{zz} and S_{xx}-S_{yy}, demonstrating that a change in molecular conformation is not necessarily the cause of such nonlinearities as suggested in the literature; (3) splitting ratio vs. ratio plots are linear throughout all phases of 4O.8 and 4O.8+HOAB mixtures; (4) the degree of ordering of the solute (fluorene) is significantly reduced in the smectic phases, in confirmation of that suggested by other solute studies reported in the literature. (29 refs.)

107527 Structural transition at the free surface of the nematic liquid crystals MBBA and EBBA. P.Chiarelli, S.Faetti, L.Fronzoni (Dipartimento di Fisica, Univ. di Pisa, Pisa, Italy).
J. Phys. (France), vol.44, no.9, p.1061-7 (Sept. 1983).
Reports measurements of the angle θ_t between the director and the vertical axis at the free surface of the nematic liquid crystals MBBA and EBBA. The basis of the technique is the same as the one reported by Bouchiat and Langevin-Cruchon (1971) for measurements on MBBA and PAA. However, some important improvements make the technique more suitable and more accurate so that they can measure θ_t to within ±1° over the whole range of the nematic phase. They find a new structural transition occurs in MBBA (and EBBA) when the temperature reaches a critical value T_0 close to the clearing temperature of the nematic LC. Below T_0 the polar angle θ_t tends to zero as $(T_0-T)^\beta$, where $\beta \simeq 0.5$ is a critical exponent. Information about the anchoring energy at the free surface of MBBA is also obtained. (27 refs.)

107528 A molecular field treatment of nematic liquid crystalline mixtures. II. Calculations of nematic-isotropic transition temperatures for binary systems with 4,4′-di-*n*-alkoxyazoxybenzenes. M.Nakagawa, T.Akahane (Dept. of Electrical Engng., Technol. Univ. of Nagaoka, Nagaoka, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2659-65 (Aug. 1983).
For pt.I see ibid., vol.52, no.2, p.399 (1983). The nematic-isotropic transition temperatures for 15 binary mixtures with 4,4′-di-*n*-alkoxyazoxybenzenes are calculated theoretically at a molecular level and compared with experimental phase diagrams. One finds good agreement between then and may confirm the validity of the geometric mean rule for the effective intermolecular attractions. The significance of the intermolecular repulsions and the flexibility of the end chains is pointed out and examined. Finally, the dependence of the nematic ordering in binary mixtures on their molecular lengths is presented. (9 refs.)

107529 The Saupe ordering matrices for solutes in uniaxial liquid crystals: experiment and theory. J.W.Emsley, R.Hashim, G.R.Luckhurst, G.N.Rumbles, F.R.Viloria (Dept. of Chem., Univ. of Southampton, Southampton, England).
Mol. Phys. (GB), vol.49, no.6, p.1321-35 (20 Aug. 1983).
A theory is described for $U(\omega_2)$, the potential of mean torque of rigid solutes at infinite dilution in a uniaxial liquid crystal phase. The general form of $U(\omega_2)$ is an infinite expansion of modified spherical harmonics $C_{Ln}(\omega_2)$, and truncation at the second rank terms produces a practical form for $U(\omega_2)$ which is used to calculate S_{xx}-S_{yy} and S_{zz}, the principal elements of the Saupe ordering matrix of a biaxial solute. The theory predicts that the dependence of S_{xx}-S_{yy} on S_{zz} for a particular solute-solvent mixture is determined entirely by λ, a parameter describing the departure from cylindrical symmetry of the potential of mean torque, and which is independent of temperature. Furthermore, if $U(\omega_2)$ is determined entirely by dispersion forces then λ is predicted to be independent of the solvent and to depend entirely on the anisotropy of the electric polarizability tensor of the solute. These predictions are tested by determining the values of S_{xx}-S_{yy} and S_{zz} by analysing proton NMR spectra of a solute, para-dinitrobenzene (PDNB), in three liquid crystalline solvents: 4,4′-di-*n*-heptylazoxybenzene (HAB), Phase 5 and E5. (18 refs.)

107530 Thermomechanical effects in cholestric liquid crystals. G.S.Ranganath (Raman Res. Inst., Bangalore, India).
Mol. Cryst. & Liq. Cryst. Lett. (GB), vol.92, no.4-5, p.105-10 (1983).
Thermomechanical effects in cholestric liquid crystals are considered in the coarse-grained approximation of Leslie's theory (1969). In certain situations one finds a close analogy with superfluid hydrodynamics. Effects of permeation have also been discussed. (11 refs.)

107531 Diamagnetic anisotropy of liquid crystalline side chain polysiloxanes in the nematic and smectic phases. M.F.Achard, G.Sigaud, F.Hardouin (Centre de Recherche Paul Pascal, Univ. Bordeaux I, Talence, France), H.Finkelmann.
Mol. Cryst. & Liq. Cryst. Lett. (GB), vol.92, no.4-5, p.111-18 (1983).
The authors report the first results on the diamagnetic anisotropy Δχ of some thermotropic side chain polymers (polysiloxanes). Kinetic effects for the bulk orientation of the nematic phase under a strong external field (H=15, 25 10^3 Gauss) are observed to be smaller than with linear polymers. The shorter the flexible spacer between the mesogenic part and the backbone is the stronger these effects are. Concerning the temperature dependence, the saturated magnetic anisotropy increases regularly with decreasing temperature to the same extent as with other nematic phases of LC monomers or linear polymers. (12 refs.)

107532 Calorimetric study of the 4-propionyl-4′-n-alkanoyloxy azobenzene series. E.Fanelli, G.Poeti, M.Braghetti (Dipartimento di Scienze Chimiche, Univ. di Camerino, Camerino, Italy).
Mol. Cryst. & Liq. Cryst. Lett. (GB), vol.92, no.4-5, p.127-34 (1983).
Systematic DSC measurements have been performed on the different terms of the 4-propionyl-4′n-alkanoyloxy azobenzene homologous series. Thermodynamical behaviour as a function of the length of the aliphatic chain and the recrystallization process are considered and discussed. (7 refs.)

107533 Structure of cubic (L_1) mesophases belonging to space group Pm3n. K.F.Fox (Unilever Res., Port Sunlight Lab., Bebington, England).
Mol. Cryst. & Liq. Cryst. Lett. (GB), vol.92, no.4-5, p.135-40 (1983).
It is shown that the structure of the cubic (I_1) mesophase of the C_{12}TACl/water system can be described as 48 sperical micelles per unit cell, with micellar centres at the coordinates of equivalent positions for the general

case of space group Pm3n. This reconciles the X-ray and NMR data for this system. This model can also be applied to the I_1 mesophase of the sodium caprylate/p-xylene/water system. (9 refs.)

107534 Mesomorphic perhydrophenanthrene derivatives. D.Varech, J.Jacques (Lab. de Chimie des Interactions Moleculaires, Coll. de France, Paris, France).
Mol. Cryst. & Liq. Cryst. Lett. (GB), vol.92, no.4-5, p.141-2 (1983).
A series of 2α, 7β-dialkyl-(4aα, 4bβ, 8aα, 10aβ) tetradecahydro-1,2,3,4,4a,4b,6,7,8,8a,9,10,10a-phenanthrenes have been prepared. Several of these hydrocarbons exhibit a nematic phase over a relatively large temperature range. (3 refs.)

107535 Whirl electrohydrodynamic instability in smectic A phase liquid crystals. D.F.Aliev, N.M.Mamedov.
Mol. Cryst. & Liq. Cryst. Lett. (GB), vol.92, no.4-5, p.143-8 (1983).
In planar oriented layers of smectic A phase a new type of instability, appearing as axial whirl, is observed and investigated. The system of lines with homotropic orientation of molecules is necessary for the creation of such a kind of instability. (6 refs.)

107536 Commensurate and incommensurate structures in a nonequilibrium system. M.Lowe, J.P.Gollub (Dept. of Phys., Haverford Coll., Haverford, PA, USA), T.C.Lubensky.
Phys. Rev. Lett. (USA), vol.51, no.9, p.786-9 (29 Aug. 1983).
A layer of nematic liquid crystal that has undergone an electrohydrodynamic instability (and contains nonequilibrium structures with period l_0) is subjected to a spatially periodic electric field with periodicity l_1. The competition between these two length scales is found to result in novel ordered phases similar to those found in equilibrium condensed-matter systems. A simple model is proposed that accounts for most of the observations. (8 refs.)

107537 Breakdown of conventional hydrodynamics for smectic-*A*, hexatic-*B*, and cholesteric liquid crystals. G.F.Mazenko, S.Ramaswamy, J.Toner (Dept. of Phys., Univ. of Chicago, Chicago, IL, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1618-36 (Sept. 1983).
The authors present a detailed analysis of anharmonic effects on the viscous and elastic properties of various systems with one-dimensional order. They show that the nonlinear coupling of the velocity field to thermally excited undulation modes causes four of the five viscosities in these uniaxial systems (including one, η_2, governing shear flow in the layers) to diverge as $1/\omega$ when measured at small frequencies ω. As a result, sound attenuations scale as ω, rather than ω^2 as in most materials. A simple algebraic relation between the divergent parts of three of the viscosities is derived. The authors argue that the divergence in η_2 leads to strongly nonNewtonian flow in the liquid layers of these materials. The calculations here extend the previous work of the authors to include an analysis of irreducible graphs to all orders in perturbation theory in the temperature. Some new results on the nonlinear elastic theory of these systems are also obtained, extending earlier work by Grinstein and Pelcovits. The existing experimental evidence for predictions is discussed, and additional experiments are suggested. (45 refs.)

107538 Influence of physical parameters of a liquid crystal on the steepness of the volt-contrast characteristic of the twist effect. G.A.Beresnev, L.M.Blinov, M.F.Grebenkin, V.A.Tsvetkov (Sci.-Res. Inst. of Organic Intermediate Products & Dyes, USSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.69-73 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.129-35 (Jan.-Feb. 1983). [received: Sept. 1983]
For a number of nematic liquid crystals, the authors have experimentally studied how the steepness of the volt-contrast characteristic of the twist effect is influenced by the elasticity constant ratio K_{33}/K_{11}, the dielectric parameter $\Delta\epsilon/\epsilon_\perp$, and the optical anisotropy. They show that the steepness increases as K_{33}/K_{11} decreases. The results agree with the theory. (13 refs.)

107539 Submicrostructure of liquid crystals of the *p-n*-alkoxybenzoic acid homologous series in a magnetic field. Ya.I.Dutchak, M.I.Fedyshin, Z.M.Mikityuk, R.N.Veksler (State Univ., L'vov, Ukrainian SSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.102-3 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.180-1 (Jan.-Feb. 1983). [received: Sept. 1983]
The aim of the authors' work was to investigate the dynamics of the process of molecular ordering of the structures of substances in the series in relation to temperature and magnetic field, by means of the method of small-angle X-ray diffraction. They studied the process of molecular ordering during cooling of the substances from the amorphous-liquid phase in magnetic fields of 0, 3600, and 5000 Oe. (9 refs.)

107540 A new type of modulated structure in a smectic *A*. P.-A.V.Kazlauskas, L.S.Klenevskis, Ya.V.Zakhazhevski (State Pedagogical Inst., Vilnius, USSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.104 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.182 (Jan.-Feb. 1983). [received: Sept. 1983]
Investigates a liquid crystal prepared from a mixture of equal weights of 4-hexyloxyphenyl-4'-butylbenzoate and 4'-nitrophenyl-4'-heptylbenzoate. Calorimetric and polarization investigations revealed that if these components are present in equal weights, at all temperatures at which a mesophase exists their mixture has only a smectic A phase. This was confirmed by investigations of the temperature dependences of the parallel ($\epsilon_\parallel$) and perpendicular ($\epsilon_\perp$) dielectric permittivities. The authors studied the electrooptic properties of the mixture. (2 refs.)

107541 A new kind of instability in the smectic-*C* phase of a liquid crystal. D.F.Aliev (State Univ. Azerbaidzhan, Baku, USSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.2, p.209-11 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.358-62 (March-April 1983). [received: Sept. 1983]
A new type of electrohydrodynamic instability, arising in thin layers of a smectic-*C* phase with initial planar orientation of the molecules, is experimentally discovered and investigated. The dependence of the basic characteristics of the effect on the parameters of the liquid crystal and the applied electric field are established. (12 refs.)

107542 Influence of low concentration of chiral molecules in nematogen on structural organization of nematic-cholesteric mixtures. Ya.I.Dutchak, R.N.Veksler, Z.M.Mikityuk, M.I.Fedyshin (State Univ., L'vov, Ukrainian SSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.2, p.233-5 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.395-7 (March-April 1983). [received: Sept. 1983]
Gives the results of an investigation of the influence of a small (0.2 wt.%) content of cholesteric liquid crystal, in nematogenic matrices with various types of structural organization, on the structural properties of the mixture. (7 refs.)

107543 Impurity molecule orientation and order parameter in the neighborhood of an impurity in a liquid crystal. I.P.Pinkevich, V.Yu.Reshetnyak, V.I.Sugakov (State Univ., Kiev, Ukrainian SSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.2, p.237-8 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.400-2 (March-April 1983). [received: Sept. 1983]
Owing to the difference between the forces of interaction between molecules of a liquid-crystal matrix and an impurity, the degree of orientation of the impurity molecule need not coincide with the degree of orientation (order parameter) of the matrix molecules. Moreover, for matrix molecules in the neighborhood of an impurity the order parameter (OP) should deviate from its value for molecules remote from the impurity. An answer to the question of how the OP is distributed in the neighborhood of an impurity molecule might be given by a microscopic theory. The authors develop such a theory for impure smectic and nematic liquid crystals in the self-consistent field approximation. The distribution found for the OP is then used to determine the displacement of the phase transition point from a liquid crystal to an isotropic liquid. (7 refs.)

107544 Optics of a chiral liquid crystal far from a Bragg resonance. R.S.Akopyan, B.Ya.Zel'dovich, N.V.Tabiryan (Inst. of Problems in Mech., Acad. of Sci., Moscow, USSR).
Sov. Phys.-JETP (USA), vol.83, no.5, p.1024-7 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1770-6 (Nov. 1982). [received: Sept. 1983]
The problem of propagation of light across a dielectric medium with a helical structure, for example through a cholesteric or a chiral smectic liquid crystal, is considered. The problem is solved for an arbitrary angle between the wave vector and the helix axis far from a Bragg resonance. The solution is obtained to within terms $\sim\epsilon_a^2$ inclusive, where ϵ_a is the permittivity anisotropy. A full allowance is made for the influence of the longitudinal components of the electric field. A solution is also given of the electrostatic problem of the macroscopic permittivity of a medium with anisotropically correlated tenor fluctuations. (8 refs.)

107545 Fluctuations and scattering of light in nematic liquid crystals. A.Yu.Val'kov, V.P.Romanov (Leningrad State Univ., Leningrad, USSR).
Sov. Phys.-JETP (USA), vol.83, no.5, p.1028-33 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1777-87 (Nov. 1982). [received: Sept. 1983]
The authors investigate longitudinal and transverse uniaxial and biaxial fluctuations in nematic liquid crystals. They show that the director fluctuations make a singular contribution not only to the longitudinal but also to the biaxial fluctuations. A general expression is constructed in the Gaussian approximation for the fluctuating contribution of the tensor order parameter to the thermodynamic potential of the liquid crystal. When account is taken of the spatial dispersion in the approximation quadratic in the wave vector, this expression contains twelve independent coefficients. In particular, for the difference $K_{33}-K_{11}$ of the Frank moduli it predicts a cubic dependence on the order parameter. The correlation function of the orientation fluctuation is calculated for both the nematic and the isotropic phase. A general analysis is presented of the conditions for the observation longitudinal and biaxial fluctuations in the usual light-scattering experimental geometry. (10 refs.)

107546 Generalisation of P.P. Ewald's intensity function for microparacrystals in colloids and their superstructures. R.Hosemann, M.P.Hentschel (Gruppe Parakristallforschung, BAM, Berlin, Germany), F.J.Balta-Calleja, G.S.Y.Yeh.
J. Phys. C (GB), vol.16, no.25, p.4959-71 (10 Sept. 1983).
The expectation value of the diffraction of an ensemble of paracrystals defined by statistically distributed point defects within their lattices can be calculated by means of the correlation function of bounded point lattices with

the help of their shape function. The result is a convolution product of their shape factor $S^2(\mathbf{b})$ with a lattice peak function $Z(\mathbf{b})$ defined by a three-dimensional convolution polynomial. $S^2(\mathbf{b})$ depends on $Z(\mathbf{b})$ because of the α^* law. For crystals the convolution product ZS^2 degenerates to P.P. Ewald's (1940) intensity function. All existing objections against the theory of paracrystals fail because they do not take into account this shape factor nor the α^* law!. (19 refs.)

107547 The structure of boron in boron fibres. J.Bhardwaj (Carbide Tools Div., TRW Inc., Rogers, AR, USA), A.D.Krawitz.
J. Mater. Sci. (GB), vol.18, no.9, p.2639-49 (Sept. 1983).
The structure of noncrystalline, chemically vapour-deposited boron fibres was investigated by computer modelling the experimentally obtained X-ray diffraction patterns. The diffraction patterns from the models were computed using the Debye scattering equation. The modelling was done utilizing the minimum nearest-neighbour distance, the density of the model, and the broadening and relative intensity of the various peaks as boundary conditions. The results suggest that the fibres consist of a continuous network of randomly oriented regions of local atomic order, about 2 nm in diameter, containing boron atoms arranged in icosahedra. Approximately half of these regions have a tetragonal structure and the remaining half a distorted rhombohedral structure. The model also indicates the presence of many partial icosahedra and loose atoms not associated with any icosahedra. (30 refs.)

107548 Isothermal changes of volume and Young's modulus of amorphous Co-P. G.Dietz, K.Huller, K.Jung (II Phys. Inst., Univ. zu Köln, Koln, Germany).
J. Non-Cryst. Solids (Netherlands), vol.57, no.2, p.265-73 (1 Sept. 1983).
The isothermal shrinkage and the isothermal increase of Young's modulus E of electrodeposited Co-P samples were studied in the amorphous state and during crystallization. The lower limit of the activation spectrum of the elementary processes responsible for these changes is shifted from 0.8 to 1.6 eV by annealing at temperatures ascending from 100°C to 220°C. From the Arrhenius equation a frequency constant of $10^{9.5\pm2.5}$ was derived. On account of the different behavior of the two properties the authors conclude that the changes of E in connection with the relaxation of the amorphous structure is mainly a consequence of the homogenization of the material and the shrinkage is mainly a consequence of the annihilation of free volume. Based on the observations a model is proposed concerning the nature of the elementary processes involved in the different steps of structural relaxation. During crystallization the correlation between the increases in Young's modulus and in density is totally removed. These results show that the observation of temporal and thermal changes of only one physical property does not yield full information about the kinetics of structural relaxation and crystallization. (31 refs.)

107549 Structural studies of amorphous Co-P and Ni-P by EXAFS. P.Lagarde (LURE, Univ. Paris-Sud, Orsay, France), J.Rivory, G.Vlaic.
J. Non-Cryst. Solids (Netherlands), vol.57, no.2, p.275-87 (1 Sept. 1983).
The EXAFS spectra of amorphous Co-P and Ni-P alloys have been recorded and analyzed on both edges of the metal and metalloid. The spectra cannot be directly fitted by the classical neutrons or X-rays results: these appear to be the average values of asymmetric radial distribution functions that the authors have to use in EXAFS analysis. Then they show that the environment of the phosphorus atoms in the amorphous state is very reminiscent of that of the Co2P or Ni3P crystalline materials. (13 refs.)

107550 Application of Miedema's coordinates to the formation of binary amorphous alloys. Z.Bangwei (Basic Courses Dept., Hunan Univ., Changsha, China).
Physica B & C (Netherlands), vol.121B+C, no.3, p.405-8 (Aug. 1983).
It is demonstrated that Miedema's coordinates can describe the formation of binary amorphous alloys quite well. With $|\Delta\phi^*|$ and $|\Delta(1/n_{ws}{}^{1/3})|$ representing the ordinate and the abscissa, respectively, it is found that the formed and nonformed areas of binary amorphous alloys can be separated by a straight line, which is given by $10|\Delta\phi^*|-39|\Delta(1/n_{ws}{}^{1/3})|-1=0$. The results compare well with those obtained from a bond-parametric diagram, whether the alloys under consideration are formed by only melt quenching techniques, or by melt quenching and other than melt quenching techniques, but are not as good as those obtained from bond-parametric diagram including the size factor. 61.40D Glasses

107551 Anisotropy of SANS in metallic glasses. A.R.Yavari (ENSEEG, Grenoble, France), M.Maret.
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.21, p.1637-42 (13 June 1983). In French.
SANS in metallic glasses is anisotropic and depends on the ribbons' orientation. Pd-based melt spun and Ni-based electrochemically deposited glasses exhibit different anisotropies. Both glasses contain scattering centers of the order of 40 nm wide in the ribbon plane. In the melt-spun alloy, the scatterers are very thin along the thickness perpendicular to the substrate. In the deposited alloy however, the defects are long along the thickness perpendicular to the electrode. (6 refs.)

107552 Neutron-diffraction investigation of the structure of glassy carbon. V.F.Petrunin, V.A.Pogonin, Yu.G.Andreev, K.P.Vlasov, V.T.Il'in (Moscow Engng. Phys. Inst., Moscow, USSR).
Inorg. Mater. (USA), vol.18, no.8, p.1091-4 (Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.8, p.L292-5 (Aug. 1982).
As a result of a neutron diffraction investigation, the structural type and parameters of a glassy carbon have been determined. The difference between the structure of this substance and that of graphite has been established. The unit cell parameters along the c-axis are different, the regions of coherent scattering are smaller, and the defect content is higher in the modification in question. These features of the structure are usually characteristic of ultradisperse media. For this reason, and also in view of the dimensions of the morphologic elements (less than 1000 Å), it is concluded that glassy carbon belongs to a new class of materials—ultradisperse media with properties which differ from the characteristics of the same materials in the usual state. (8 refs.)

107553 X-ray scattering studies of glasses in the system ZrF_4-BaF_2. R.Coupe, D.Louer (Lab. de Cristallochimie, Univ. de Rennes, Rennes, France), J.Lucas, A.J.Leonard.
J. Am. Ceram. Soc. (USA), vol.66, no.7, p.523-9 (July 1983).
A Fourier analysis of X-ray scattering by glasses in the system ZrF_4-BaF_2 is presented. The first peak in the radial distribution functions occurs in the range 0.209 to 0.211 nm; the average coordination numbers estimated for the zirconium atom are in the range 7.08 to 8.35, depending on the chemical composition. The second peak has been broken down into two components attributed to two kinds of Ba-F distances, 0.261 to 0.266 and 0.307 to 0.319 nm, with a corresponding coordination number of barium with respect to fluorine atoms ranging from 8.70 to 10.68. Interpretation of the cation-cation region is suggested; the average angle values of the Zr-F-Zr bridge bond, varying from 150° to 160°, prevent two neighboring zirconium atoms from being bonded through two fluorine atoms. Comparative discussions with crystalline structures of fluorozirconates are presented. (43 refs.)

107554 Bond character and properties of the mixed alkali system Na_2O-K_2O-Al_2O_3-SiO_2. A.Klonkowski (Tech. Univ. Clausthal, Clausthal-Zellerfeld, Germany).
J. Non-Cryst. Solids (Netherlands), vol.57, no.2, p.339-53 (1 Sept. 1983).
The mixed alkali glass system Na_2O-K_2O-Al_2O_3-SiO_2 was investigated. Density, transformation temperature, refractive index, and chemical durability were studied. Optical absorption and ESR spectra of the CuO-doped glasses were determined. Calculations of the polarizability of O^{2-}, bonding parameters of the Cu^{2+} complex, and the packing density are presented. It was found that for the mixed alkali glasses, the oxygen-alkali bond has a more ionic character than expected from additivity. This fact enables the non-linear changes of the refractive index, of the shift of the Cu^{2+} absorption band, and of the covalency to be interpreted as the Na mole fraction is varied. It is also possible to explain qualitatively the density, T_g and chemical durability non-linear variations with change of the Na content by the ionicity deviations of the bond character and by postulated pairs of Na^+ and K^+ ions in the mixed alkali glasses. (32 refs.)

107555 Preparation, crystallization, and magnetic properties of amorphous $Fe_{100-x}B_x$ ($18\leq x\leq42$). F.Kanamaru, S.Miyazaki, M.Shimada, M.Koizumi (Inst. of Sci. & Industrial Res., Osaka Univ., Osaka, Japan), K.Oda, Y.Mimura.
J. Solid State Chem. (USA), vol.49, no.1, p.1-5 (Aug. 1983).
Amorphous $Fe_{100-x}B_x$ alloys were prepared by the RF-sputtering method in a chemical composition range of $18\leq x\leq42$. The crystallization temperature of the amorphous alloys increases with the B contents up to near $x=36$, above which the crystallization temperature decreases monotonically. This anomaly is reflected in the composition dependence of the Curie temperature and the coercive force of the amorphous alloys. (23 refs.)

107556 Relaxation processes in amorphous metallic alloys during heating. E.Ya.Malinochka, A.M.Durachenko, V.T.Borisov.
Russ. Metall. (GB), no.3, p.87-90 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.99-103 (1982).
Differential scanning calorimetry was used to determine the thermal effects corresponding to high-temperature relaxation processes that occur on heating amorphous metallic alloys. The changes in the ratio of the values of the relaxation peaks on the DSC curves as a result of heat-treating these alloys can be attributed to the existence of a number of levels in the internal energy of an amorphous system which are separated by potential barriers, the heights of which correspond to particular activation energies for relaxation phenomena. (10 refs.)

107557 Crystallization properties of lead glasses. L.Sasek, Nguyen Van Tu, M.Bartuska (Dept. of the Technol. of Silicates, Inst. of Chem. Tech., Prague, Czechoslovakia).
Silikaty (Czechoslovakia), vol.27, no.3, p.233-43 (1983). In Czech.
The crystallization was examined in the systemn Na_2O-K_2O-BaO-PbO-SiO_2 by the gradient method after Silvermann. Crystallization was found to affect the viscosity of glass, and this in turn influences the rate of growth of the arising crystallization nuclei. All the glasses followed were found to be subject to surface crystallization which is promoted by the loss of volatile components from the surface of glass melts. The precipitating phases are sanbornite ($BaO.2SiO_2$) and tridymite. Sanbornite is mostly formed in glasses having a low liquidus temperature (below 850°C) and containing 24% PbO and 7% BaO. The crystallization ability of the given system of glasses was further found to depend above all on the content of alkalies and on the total content of PbO+BaO. (9 refs.)

107558 On the formation of transition metal-rich glassy phases in the systems Ni-As, Pd-As and Pt-As. M.El-Boragy, M.Ellner, B.Predel (Max-Planck-Inst. fur Metallforschung, Stuttgart, Germany).
Z. Metallkd. (Germany), vol.74, no.8, p.545-8 (Aug. 1983). In German.
For studying the glass-forming ability, splat-cooling investigations have been made in the systems Ni-As, Pd-As and Pt-As. While in the systems Pd-As and Pt-As metallic glasses were found, the splat-cooled alloys in the system Ni-As were crystalline only. In the ternary system Pd-Pt-As, a limited solubility of the binary metallic glasses $Pd_{80}As_{20}$ and $Pr_{72}As_{28}$ was found. A phase equilibrium investigation in the system Pt-As shows that $PtAs_2$ with FeS_2(h) structure is the only compound in this system. The criteria for the glass-forming ability in the systems with nickel, palladium and platinum as one component and a 3d-element gallium, germanium or arsenic as the second one, respectively, are discussed. (16 refs.)

107559 Laser-generated glassy phases. M.V.Allmen (Inst. of Appl. Phys., Univ. of Bern, Bern, Switzerland).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.691-702
Short laser pulses have recently been discovered to be powerful means for glass formation in binary alloys as well as in some pure elements. Due to relevant cooling rates in excess of 10^{10} K/s, glass formation is achieved in

binary systems over most of the phase diagram, even in systems not previously known as glass formers. The author gives a review of recent progress in laser melt quenching, and then discusses the kinetic conditions of glass formation by laser irradiation. (17 refs.)

61.40K Polymers, elastomers, and plastics

107560 X-ray study of the structure of polyvinyl chloride-non-polar plasticizer systems. A.B.Surovtsev, V.P.Lebedev, B.V.Teplov, M.N.Shlykova.
Vysokomol. Soedin. Ser. B (USSR), vol.25, no.7, p.508-12 (1983). In Russian.
Small angle X-ray studies on PVC with differing TNM plasticizer content showed scattering over the 5-60 interval due to inhomogeneity in density distribution at 10-100 Å. Diffuse scattering increased with plasticizer content. With ethereal plasticizers, discrete scattering occurred dependent on the thermal pre-history. Plasticizers produced noticeably lower densities at small angle scattering to give inhomogeneous distribution at 10 Å. It was concluded that the plasticizers did not affect the crystal structure but altered the properties of the amorphous part of PVC. (10 refs.) *R.H.*

107561 Gelation/crystallisation of poly(vinyl chloride). A.Dorrestijn, P.J.Lemstra (DSM, Central Lab., Geleen, Netherlands), H.Berghmans.
Polym. Commun. (GB), vol.24, no.8, p.226-30 (Aug. 1983).
The gel formation of PVC and post-chlorinated PVC samples (CPVC) in DOP (di-(2-ethylhexyl)phthalate) was studied by measuring the storage modulus as a function of time/frequency. Random chlorination of PVC in solution completely suppresses gelation when more than 13 mole % additional chlorine is introduced, which is in contrast with bulk chlorinated samples. These differences are ascribed to the influence of intramolecular chlorine distribution on crystallizability. (14 refs.)

107562 Molecular motion in a poly(vinyl alcohol) crystal. M.Nagura, S.Matsuzawa, K.Yamaura, H.Ishikawa (Faculty of Textile Sci. & Technol., Shinshu Univ., Ueda, Japan).
Polym. Commun. (GB), vol.24, no.8, p.250-3 (Aug. 1983).
To study the molecular motion in a crystal of poly(vinyl alcohol), PVA, the relationship between packing of chains in the crystal and relaxation phenomena was investigated using an X-ray diffractometer, an infra-red spectrophotometer, and a dynamic viscoelastometer. There are two dispersions in the temperature dependence of the dynamic loss tangent at ~90°C and above ~100°C for annealed highly syndiotactic PVA as well as atactic PVA. It was established that the molecular motion in the crystal above 100°C occurred in only the loose packing region, in which the formation of the intermolecular hydrogen bonds was hindered by the molecular configuration such as the high concentration of the head-to-head linkages and the low syndiotacticity. (10 refs.)

107563 EXAFS evidence for local order in the ionic aggregates of halato-telechelic polymers. R.Jerome (Lab. de Chimie Macromoleculaire et de Catalyse Organique, Univ. de Liege, Liege, Belgium), G.Vlaic, C.E.Williams.
J. Phys. Lett. (France), vol.44, no.17, p.L717-23 (1 Sept. 1983).
The ionic aggregates in bulk halato-telechelic polymers, a class of ion-containing polymers with well controlled molecular characteristics, have a high degree of local order, as shown by EXAFS spectroscopy. In zinc neutralized carboxy telechelic polybutadiene each cation is surrounded by an average of 6 oxygen neighbours as well as by a second shell of up to 5 zinc atoms at a distance of 3.22±0.02 Å. The influence of humidity during sample preparation and elaboration is also investigated. (21 refs.)

107564 Small-angle neutron scattering measurement of block copolymer interphase structure. R.W.Richards, J.L.Thomason (Dept. of Pure & Appl. Chem., Univ. of Strathclyde, Glasgow, Scotland).
Polymer (GB), vol.24, no.9, p.1089-96 (Sept. 1983).
The notion of an interfacial layer at the domain boundary in block copolymers is reviewed and the possibility of its measurement by small-angle X-ray and small angle neutron scattering discussed. Values of the interfacial layer thickness and its volume fraction have been obtained for a range of styrene-isoprene copolymers. Interfacial layer thickness is not strongly dependent on molecular weight whilst the volume fraction shows a dependence more in line with the theory of Helfand (1975). (44 refs.)

107565 Some neutron experiments on flexible polymers. P.G.de Gennes (Coll. de France, Phys. de la Matiere Condensee, Paris, France).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.407 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The present review is concerned only with linear chains with a large number N of monomers per chain ($N \sim 10^{14}$). The emphasis is mainly on semilocal properties, i.e. the wavevectors q such that $a^{-1} \gg q > R^{-1}$ where a is a monomer size and R is a coil size. Dilute solutions of polymers are not convenient for neutron studies, but semi-dilute solutions (where the coils overlap) are interesting. The main feature here (for good solvents) is the existence of a single characteristic length $\xi(C)$ which is a decreasing function of the concentration C. For $q\xi > 1$ one still has single chain correlations while for $q\xi < 1$ each chain behaves like an ideal coil. Dynamically, for $q\xi < 1$ one measures a certain cooperative diffusion coefficient, while the $q\xi > 1$ the width Γ_q of the dynamical form factor scales like q^3. This has been seen both by photon beats (using very long chains) and by neutrons (with the spin echo technique). (3 refs.)

107566 Configuration of the polyisobutylene chain in bulk and in solution according to elastic neutron scattering. H.Hayashi, P.J.Flory (IBM Res. Lab., San Jose, CA, USA).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.408-12 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The dimensions and configurations of polyisobutylene (PIB) chains in the bulk and in a θ-solvent have been investigated by elastic neutron scattering at small and at intermediate angles. The z-average radii of gyration, $\langle s^2 \rangle_z^{1/2}$, of protonated PIB were calculated from Zimm plots in the Guinier region. Values of $\langle s^2 \rangle_z^{1/2}$ measured in a deuterated PIB matrix (75±5 Å) and in the θ-solvent (77±5 Å) are in good agreement. Results of scattering measurements at intermediate angles were compared using Kratky plots on an absolute scale. The scattering curves for protonated PIB in the deuterated PIB matrix and in the θ-solvent were in excellent accord in the range of $0 < \mu < 0.6$ Å^{-1} ($\mu = 4\pi \sin \theta/\lambda$), demonstrating that the configuration in the bulk is virtually the same as in a θ-solvent. The experimental data were compared also with theoretical scattering functions. Close agreement throughout the range of μ covered by the covered by the experiments confirms the underlying conformational analysis and demonstrates randomness of configurations in the bulk down to distances of ca. 10 Å. (6 refs.)

107567 Multiplicity of relaxational processes of recrystallized polychloroprene. G.T.Ovanesov.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.8, p.1708-12 (Aug. 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
Crystallization of polychloroprene nairite NTN results in an increase of T_g, while annealing decreases it. The activation energy of the relaxation process is changed symbatically with T_g. Sulfur distributed among polychloroprene monomer units results in appearance of additive relaxational processes in the region of main transition from glassy into rubberlike state. The intensity of the maximum of dielectric loss of crystallized polymer after annealing exceeds the intensity obtained for amorphous elastomer. (10 refs.)

107568 Study of relaxational properties of elastomers by diffusional method. I.S.Yurovskaya, B.S.Grishin, I.A.Tutorskii.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.8, p.1728-33 (Aug. 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
The high-temperature relaxational transition in polyisoprene and butyl rubber has been studied by the diffusional method. With increase of MM of a polymer up to some critical value the coefficient of diffusion of solid low-molecular compound is quickly decreased and after attaining of critical value of MM stays constant. The very thin network of cross bonds depresses the high-temperature transition and decreases the coefficient of diffusion. The mechanical treatment results in irreversible decrease of the coefficient of diffusion. The values of relaxation time of reconstruction of polymer structure after mechanical treatment are estimated from diffusional data. (23 refs.)

61.50 CRYSTALLINE STATE

(inc. molecular motions in solids; for magnetic structure and spin systems, see 75.25)

107569 ONS investigations of pivalic acid; $(CH_3)_3CCOOH$. S.Urban (Inst. of Phys., Jagellonian Univ., Cracow, Poland), J.Mayer, A.I.Belushkin.
Acta Phys. Pol. A (Poland), vol.A64, no.2, p.161-5 (Aug. 1983).
The results of a quasielastic neutron scattering (QNS) investigation on pivalic acid, $(CH_3)_3CCOOH$, in two solid phases are presented. The neutron spectra obtained for the low temperature phase correspond to the spectrometer resolution function, whereas in the high temperature phase (plastic phase) distinct quasielastic broadening is observed. Based on model calculations it is concluded that this quasielastic broadening is mainly connected with uniaxial rotational jumps over 120° of t-butyl groups with a correlation time 5.10^{-12} sec. (11 refs.)

107570 Rotational states of NH_4^+ in dilute solution in alkali halide lattices. I. Inelastic neutron scattering studies. A.Heidemann, J.Howard, K.J.Lushington, J.A.Morrison, W.Press, J.Tomkinson (Inst. Laue-Langevin, Grenoble, France).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2401-13 (July 1983).
Rotational tunneling and torsional energy states of the NH_4^+ ion in several alkali halide lattices (KCl, KBr, KI, RbI and CsI) have been characterized in the energy range $0<\epsilon<42$ meV. The most detailed spectra are obtained for the specimen KBr/NH_4Br (0.5 mole%) at low energies ($\epsilon<2$ meV) and in the temperature region $1.5<T<30$K. The results are consistent with a model of energy states for a tetrahedron in an octahedral field. An investigation of the ratios of the intensities of neutron energy loss and energy gain peaks in the spectra for $KBrNH_4Br$ (0.5%) leads to the conclusion that conversion between the nuclear spin symmetry species of NH_4^+ occurs with a characteristic time of several hours. Moreover, the heat capacity results display a non-lattice contribution which is much less than that which would correspond to rapid spin conversion. On the other hand, the intensity ratios for the neutron spectra of two specimens prepared by evaporation of aqueous solutions (KI/NH_4I (2.3%) and RbI/NH_4I (2.9%)) suggest that conversion is more facile in them. (6 refs.)

107571 Rotational states of NH_4^+ in dilute solution in alkali halide lattices. II. An NMR study of KBr/NH_4Br. T.Yamamoto, H.Chihara (Dept. of Chem., Osaka Univ., Toyonaka, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2414-18 (July 1983).
For pt.I see ibid., vol.52, no.7, p.2401 (1983). Nuclear magnetic relaxation of the protons of NH_4^+ in dilute solution (0.5 mole%) in KBr is measured between 2 and 259K. The approach to equilibrium at 4.2K is slow, the time constant being 1.5 ± 0.2 hr, owing to conversion between nuclear spin symmetry species. There is a minimum in the spin-lattice relaxation time of 3.8 ± 0.2 s at 5.3K. From the slope of T_1 vs. T^{-1} on the high temperature side, the activation energy is found to be 105 ± 10 J $mole^{-1}$, which approximately corresponds to some average of separations between low-lying rotational levels. The spin-spin relaxation time, T_2, is also long (1.0 ± 0.1 ms) and independent of temperature. The equilibrium value of $\langle I(I+1)\rangle$, the ensemble average of the resultant nuclear spin, is slightly less than 4.3 at 4.2K. Deviations from Curie's Law are observed below about 10K. These results are compatible with a model of the NH_4^+ ion as a three-dimensional quantum rotor placed in a potential field of octahedral symmetry.

107572 Temperature dependence of rotational isomerisation and molecular reorientation rates in plastic succinonitrile. M.Bee (Lab. de Dynamique des Cristaux Moleculaires, Univ. des Sci. et des Tech. de Lille, Villeneuve d'Ascq, France), R.E.Lechner, J.P.Amoureux, R.Fouret.
J. Phys. C (GB), vol.16, no.25, p.4973-83 (10 Sept. 1983).
Using the incoherent quasi-elastic neutron scattering (IQNS) technique, the authors have studied the molecular motions of the succinonitrile molecule $N{\equiv}C\text{-}(CH_2)_2\text{-}C{\equiv}N$ in the plastic phase ($233K<T<331K$). The measurements were done using the backscattering spectrometer IN 10 of the Institut Laue-Langevin. The observed quasi-elastic spectra prove the validity of a model allowing for both motions of isomerisation between two gauche and a trans conformation and rotational motions of the molecule in its trans form from a diagonal of the BCC unit cell to another one. The correlation times found by refining this model to the data are: $\tau_{t\to t}(s)=1/k=(7.67\pm1.43)\times10^{-14}\times\exp[(1762\pm44)/T(K)]$ for the rotational motion, and $\tau_{g\to t}(s)=1/k'=(1.03\pm0.40)\times10^{-15}\times\exp[(3220\pm130)/T(K)]$ for the reaction of isomerisation gauche$\rightleftharpoons$trans. (26 refs.)

107573 Possible invariant unitary crystal-structure types. Y.Sakamoto (Dept. of Materials Sci., Hiroshima Univ., Hiroshima, Japan), A.Kida, K.Hiraga, H.Murata.
J. Sci. Hiroshima Univ. A (Japan), vol.46, no.3, p.371-461 (May 1983).
By the lattice-complex (LC) method all the crystallo-geometrically possible crystal-structure types (CST) are symbolized, classed under a registry number list, and enumerated in regard to the invariant unitary case, and their fundamental properties are described minutely. The main subjects treated are: symbolism and classification (jointly, of pseudoinvariant LCs), orderly register of PIUCSTs with their individual characteristics, interrelation of CSTs among crystal families, isohedral and isogonal (or simple coordination) polyhedra, Patterson-vector set, radial distribution of lattice points, Dirichlet domain, interstices in a cubic LC, correspondence of a LC to a net due to Wells's crystal-net method, relation to the Latin square, lists of possible and known IUCSTs and errata to some quoted works. (76 refs.)

61.50C Physics of crystal growth

(for techniques of crystal growth and film deposition, see 81.10 and 81.15; for epitaxy, thin films, see 68.55; for whiskers, see 68.70)

107574 Reciprocal crystal and PBC-vector method. Crystal growth of a-sulphur. H.Follner (Inst. fur Mineralogie and Mineralische Rohstoffe, Tech. Univ. Clausthal, Clausthal-Zellerfeld, Germany).
Cryst. Res. & Technol. (Germany), vol.18, no.7, p.873-80 (1983).
The morphological lattice of α-sulphur (F ddd) has coordinates 1/8, 1/8, 0. The reciprocal crystal is a polyhedron with 15 faces and point symmetry 112. The arrangements of the polyhedra parallel to the crystal faces confirm that (100), (101), (010), (011), (111), (113), (001) are F-faces and (110), (112) S-faces according to Hartman (1980) and Perdok. Under consideration of the extinction rules of the morphological lattice (101) and (011) have to be regarded as S-faces. The size of the polyhedra faces is proportional to the interaction energy given by Hartman. It is shown that the face area of the net planes, divided by the number of molecules per growth layer, represent a good approximation to the attachment energy calculated according to Hartman. The average deviation for α-sulphur is 3% for olivine and SnJ_4 8.5% and for anthracene 10.5%. The Wulff-plots correspond fully to the experimental observations. (12 refs.)

107575 Surface morphology and growth mechanisms of Argyrodite-type Cu_6PS_5Hal crystals. S.Fiechter, J.Eckstein (Kristallographisches Inst., Albert Ludwigs-Univ., Freiberg-Breisgau, Germany), W.J.P.van Enckevort, J.J.M.Binsma.
Cryst. Res. & Technol. (Germany), vol.18, no.7, p.881-7 (1983).
Simple crystals of Cu_6PS_5Hal (Hal=Cl, Br, I) have been grown by dissociative sublimation and by chemical vapour transport with P, S, Hal, CuHal and combinations thereof as transporting agents in the temperature range 800 to 1000K. Microscopic observation of the tetrahedral faces revealed several growth features. Macrosteps, closed loop steps and surface protuberances are always accompanied with the presence of liquid $CuHal/Cu_2S$ droplets on the growing crystal surface. The phenomena are characteristic for a two-dimensional vapour-liquid-solid growth mechanism. In the absence of $CuHal/Cu_2S$ liquid phase, direct growth from the gas phase (VS growth) takes place leading to hillocks and growth spirals with low step heights ($\sim5-10$ Å). (16 refs.)

107576 Crystallization of bismuth telluride from a melt containing excess tellurium. A.D.Galetskaya, V.A.Kutasov, T.A.Smorodina, V.V.Sologub (A.F. Ioffe Physicotech. Inst., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1563-6 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1820-3 (Nov. 1982).
The authors propose a model of defect centers arising in the crystallization of Bi_2Te_3 from melts of various compositions. They show that the carrier concentrations in successively grown p-type and n-type specimens increase with the tellurium content of the original melt. At 77K the carrier mobility in p-type specimens close to the transition region is anomalously low in comparison with specimens obtained from stoichiometric melts. (7 refs.)

107577 Evaporation of carbon from the melt during the growth of silicon single crystals. V.V.Voronkov, V.P.Grishin, L.V.Lanier (State Sci.-Res. & Design Inst. of the Rare-Earth-Metal Industry, USSR).
Inorg. Mater. (USA), vol.18, no.9, p.1225-8 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1440-3 (Sept. 1982). [received: Sept. 1983]
The authors have considered the general features of the evaporation of impurity from the melt and methods of estimating the evaporation coefficient. The analysis shows that evaporation of carbon can be neglected when growing single crystals of silicon by the Czochralski method and by crucible-free zone melting (particularly in the case of the latter). (4 refs.)

107578 Growth and physical properties of Ln_2GeSe_5, $Ln_2Ge_2Se_7$, $Ln_2Ge_3Se_9$ single crystals. I.O.Nasibov, M.M.Alieva, P.G.Rustamov (V.I. Lenin Azerbaidzhan State Pedagogic Inst., Azerbaidzhan SSR).
Inorg. Mater. (USA), vol.18, no.9, p.1282-5 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1500-3 (Sept. 1982). [received: Sept. 1983]
Chemical transport reactions have given single crystals from polycrystalline materials for selenogermanates of compositions Ln_2GeSe_5, $Ln_2Ge_2Se_7$, and some of the physicochemical properties of these have been examined. Thermal and chemical analyses indicate a mechanism for the formation of the single crystals, and the optimum conditions for producing them from the gas phase have been established. The widths of the forbidden bands in Ln_2GeSe_5 (Ln=La, Ce, Pr) are 1.68, 1.61, and 1.86 eV, while for $Ln_2Ge_2Se_7$ they are 1.19, 1.21 and 1.42 eV, correspondingly. (7 refs.)

107579 The growth mechanism of octahedron faces of potash alum. A.V.Belyustin, I.M.Levina (Res. Physicotech. Inst., Gor'kii, USSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.109-10 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.190-1 (Jan.-Feb. 1983). [received: Sept. 1983]
For the {111} octahedron faces of crystals of potash alum, the dependences of the growth rates V on the relative supersaturation σ agree with the theory of Burton, Cabrera, and Frank (BCF) for growth from solution, assuming that the crystal is fed by surface diffusion. This theory satisfactorily describes most V(σ) curves obtained for other substances. In order to reconcile the growth rates of prism faces of epsomite crystals with the theory, account must also be taken of direct incorporation of particles from the bulk of the solution. The authors consider how far the BCF model applies to the {111} faces of potash alum. (10 refs.)

107580 Periodic capture of melt by a growing crystal. A.S.Dzyuba (State Univ, Khar'kov, Ukrainian SSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.111-12 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.192-3 (Jan.-Feb. 1983). [received: Sept. 1983]
Gives the results of experiments undertaken with the aim of studying the mechanism and kinetics of formation of inclusions during growth of a single crystal from a supercooled, gas-saturated melt. The author investigated the growth of salol crystals (melting point 41.5°C) from an air-saturated melt, supercooled by $\Delta T=1\text{-}5K$. (5 refs.)

107581 Implications of the lack of wetting at the monotectic growth front. B.Derby (Lab. d'Etude de la Solidification, CEN, Grenoble, France).
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.277-80
A number of microgravity experiments have been proposed using monotectic alloys but little is known about the monotectic reaction. A recent ground-based study of monotectics has shown currently held models to be oversimplified and that in most monotectic systems the liquid and solid reaction products do not wet each other as has been previously believed. This lack of wetting results in repulsive forces which may affect the microstructure of microgravity solidified alloys. The magnitudes of these forces are calculated and presented in light of some past and proposed experiments. (13 refs.)

107582 Order of magnitude analysis of solute macrosegregation in crystal growth from the melt. J.J.Favier, D.Camel (CEN, Grenoble, France).
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.295-9
The influence of buoyancy driven thermal convection on macrosegregation in a typical horizontal Bridgman crystal growth configuration is analysed for the whole range of possible values of the parameters. Two main reference quantities appear in the analysis L_s, the length scale for the fluid flow field, L_n, the extent of the boundary layer for solute transport. L_2 mainly depends on the geometry of the cell. L_n depends on the data of the problem, and obeys two different scaling laws according to the nature of the controling driving force; accordingly, two basic boundary layer transport regimes are distinguished: a convective-diffusive regime, and a purely diffusive regime. Within this framework, the influence of the experimental parameters and particularly the gravity level on longitudinal macrosegregation is described in a systematic way. The possibility of producing homogeneous crystals of a given size and dope level is discussed as a function of the available gravity conditions. (15 refs.)

107583 Full representations of the double space groups based on the simple cubic lattice. H.W.Kunert (Inst. of Phys., Tech. Univ., Poznan, Poland).
Physica A (Netherlands), vol.120A, no.1-2, p.213-18 (1983).
The generating matrices of the induced (full) representations for the space groups $Pm3m(=O_h^1)$. $Pn3n(=O_h^2)$, $Pm3n(=O_h^3)$ and $Pn3m(=O_h^4)$ have been calculated. The author has considered the representations corresponding to four high-symmetry points Γ, R, X, and M in the Brillouin zone. He gives explicitly the generators and generating relations for the full irreducible representations induced from the small irreducible representations of Miller and Love. Using these generators and generating relations and the program written in ALGOL, for the computer ODRA 1204 he has calculated the matrices of the full irreducible representations of the full space goups $G^{k\Gamma}$, G^{kR}, G^{*kM} and G^{*kX}. (15 refs.)

107584 On sphere packing, interaction field partitions and coordination numbers from point configurations with trigonal symmetry $R\bar{3}m$. E.Zobetz (Inst. fur Mineralogie und Kristallographie, Univ. Wien, Wien, Austria).
Z. Kristallogr. (Germany), vol.163, no.3-4, p.167-80 (1983). In German.
Sphere configurations and partitions of three-dimensional space into Dirichlet domains have been studied for the point configurations of the trigonal lattice complex $R\bar{3}m$ 6(c). In total, 11 sphere-configuration types and 12 types of Dirichlet partitions have been derived. Utilizing the concepts of Hoppe (1970, 1979) and O'Keeffe (1979), coordination numbers for this two-dimensional field have been calculated. (30 refs.)

107586 Crystallography of dislocations inherited in martensitic transformations and twinning. G.E.Brainin, V.A.Likhachev (Leningrad Univ., Leningrad, USSR).
Phys. Met. (GB). Translation of: Metallofizika, Kiev (USSR), vol.4, no.3, p.489-502 (1982). [received: Aug. 1983]
Presents a theoretical analysis of dislocation inheriting in the diffusionless martensitic transformations FCC⇄BCC, FCC⇄HCP, BCC⇄HCP, CsCl⇄NaCl, and twinning in FCC, BCC, HCP lattice and $CaCo_3$. Matrices are derived showing the correspondence between the Burgers vectors of the initial dislocations and the dislocations in the transformation product. It is shown that the inheriting of dislocations is associated with substantial energy difficulties, because a great many inherited dislocations acquire Burgers vectors that are not characteristic of the transformation product. Moreover, total dislocations are sometimes transformed into partial ones. On the basis of the theoretical analysis, an attempt is made to elucidate or to determine more accurately the nature of phenomena that accompany martensitic transformations and twinning. These include the shape memory effect, different effects of cold working on direct and reverse transformations, oriented microstresses, causes of reversible twinning and crystallographically reversible martensitic transformation. (20 refs.)

107587 The system HfO_2-RE oxide with high RE oxide contents. A.V.Shevchenko, L.M.Lopato (Inst. of Problems in Materials Sci., Acad. of Sci., Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.11, p.1583-6 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1842-6 (Nov. 1982).
Phase diagrams of the systems HfO_2-RE oxide (RE=La, Pr, Nd, Sm, Gd, Tb, Dy, Y, Er, Yb, Lu, and Sc) have been constructed making use of annealing, quenching (cooling rate 10^2-$10^{4\circ}$C/sec), and DTA techniques at temperatures ranging from 1800°C to the melting point in the RE oxide concentration range 60-100 mole %. The effect of the addition of HfO_2 on the high temperature polymorphic transformation of RE oxides has been studied. The findings of the study have been elucidated from the standpoint of crystal chemistry. (8 refs.)

107588 The phase transformations and thermal expansion of the solid electrolyte Cu_3BiS_3 between 25 and 300°C. E.Makovicky (Inst. of Mineralogy, Univ. of Copenhagen, Copenhagen, Denmark).
J. Solid State Chem. (USA), vol.49, no.1, p.85-92 (Aug. 1983).
The phase transformations and thermal expansion of Cu_3BiS_3 wer studied up to 300°C using heated Weissenberg and Guinier cameras. At 118.5°C a transformation takes place from the $P2_12_12_1$ to a modulated $Pn2_1a$ or $Pnma$ polymorph. The modulation changes continuously, with decreasing intensities of X-ray satellites, from $\sim 3.14c$ at 118.5°C toward $\sim 2c$ at 190°C. At 191°C an unmodulated, high $Pnma$ polymorph is formed. The lattice parameters are $a=7.705$, $b=10.400$, and $c=6.720$ Å at room temperature. They expand only slightly in the low form; a and c contract in the intermediate form, and c contracts further in the high form. The unit cell volume remains nearly constant between 25 and 300°C. The observed phenomena result from redistributions of copper atoms over available structural sites and, at above $\sim$135°C, from the conversion of these atoms from a stationary to a mobile state. 107589 Evaluation of the crystal binding and compressibility of alkali hydrides. B.R.K.Gupta, V.Kumar (Dept. of Phys., G.B. Pant Univ. of Agriculture & Technol., Pantnagar, India).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.9, p.1011-15 (1983).
An analysis is made of the crystal binding and the compressibility of alkali hydrides using an interionic force model in which the long range electrostatic forces are balanced by the short range forces. The first and second nearest neighbour repulsive potentials are evaluated from the knowledge of the overlap integrals. The contribution arising from the Van der Waals potentials is evaluated from the Slater-Kirkwood variational method. Values of the cohesive energy and compressibility are calculated for all the alkali hydrides. The results obtained are in good agreement with experimental values. (17 refs.)

107590 Some peculiarities of the chemical bond in monochalcogenides of elements of subgroup IIIB with a TlSe structure. R.S.Erofeev.
Inorg. Mater. (USA), vol.18, no.11, p.1550-4 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1807-10 (Nov. 1982).
It was established that a peculiarity of the atomic interaction in monochalcogenides of elements of subgroup IIIB with TlSe structure, for example, is the presence of neighbors of the atoms in numbers exceeding the number of overlapping electronic orbitals, which is due to the possibility of the appearance of directed bonds with a multiplicity of the bonds less than 0.5. The ability of the p-orbitals for nonsymmetrical bilateral overlapping leads to their supplementary overlapping according to the type of formation of a π bond, which causes a shortening of the interatomic distances along the c-axis. The distribution of electrons among the electronic orbitals, according to the proposed scheme of their overlapping, is evidence that TlS and TlSe should be semiconductors; while InTe should possess semimetallic p-type conductivity along the c-axis, which agrees with the experimental data. (9 refs.)

107591 Lone-pair electronic effects on the calculated ab initio SCF-MO electric potential and the crystal structures of azabenzenes. D.E.Williams, R.R.Weller (Dept. of Chem., Univ. of Louisville, Louisville, KY, USA).
J. Am. Chem. Soc. (USA), vol.105, no.13, p.4143-8 (29 June 1983).
Molecular charge distribution models for pyridine, pyridazine, pyrimidine, pyrazine, *s*-triazine, and *s*-tetrazine were evaluated from SCF-MO wave functions. Potential-derived net atomic charges and lone-pair electron site charges were obtained from the calculated electrostatic potential around the molecules. The charge site models were tested by using them to predict the crystal structures of pyrimidine, pyrazine, *s*-tetrazine, and two forms of *s*-triazine by molecular packing analysis. (47 refs.)

107592 Elementary methods for the evaluation of electrostatic potentials in ionic crystals. H.Coker (Dept. of Chem., Univ. of South Dakota, Vermillion, SD, USA).
J. Phys. Chem. (USA), vol.87, no.14, p.2512-25 (7 July 1983).
A new and elementary method for the calculation of electrostatic potentials in ionic crystals is presented. The method is applicable to crystals of any symmetry and complexity. It is denoted the method of dipolar addition since it involves an arbitrary pairing of the charges of the unit cell into dipoles. The rate of convergence is rapid with an accuracy suitable for most purposes achieved on the addition of three shells around a central unit cell. The traditional direct-summation methods of H.M. Evjen (1932) and F.C. Franck (1950) have been modified and extended. (23 refs.)

107593 Dynamics of the hydrogen bond in CsH_3O_2 from quasielastic neutron scattering. M.Stahn, R.E.Lechner (Hahn-Meitner-Inst., Bereich Kernchemie und Reaktor, Berlin, Germany), H.Dachs, H.E.Jacobs.
J. Phys. C (GB), vol.16, no.26, p.5073-82 (20 Sept. 1983).
Incoherent neutron scattering results on the layered hexagonal phase of CsH_3O_2 are presented. The elastic incoherent structure factor (EISF) measured at 402K indicates that the protons are dynamically disordered in a double well potential between adjacent oxygen atoms. The dynamics are well approximated by a two-site random jump model with a mean residence time of 1.25×10^{-11} s per site and a jump distance of 1.03 Å. The large value of the latter suggests a non-linear hydrogen bond. (13 refs.)

107594 Structural origin of optical bowing in semiconductor alloys. A.Zunger, J.E.Jaffe (Solar Energy Res. Inst., Golden, CO, USA).
Phys. Rev. Lett. (USA), vol.51, no.8, p.662-5 (22 Aug. 1983).
The principle of conservation and transferability of chemical bonds explains the recent discovery by extended X-ray-absorption fine-structure measurements of two unequal anion-cation bond lengths R_{AC} and R_{BC} in $A_xB_{1-x}C$ zinc-blende semiconductor alloys despite the close adherence of the lattice constant to the average value (Vegard rule). This bond alternator, manifested as a structural distortion to a local chalcopyrite coordination around the anions, explains also most of the observed optical bowing in semiconductor alloys. (24 refs.)

107595 Statistical thermodynamic approach to some hyperstoichiometric dihydrides of lanthanides (La, Ce, Pr, Nd, Sm) and actinides (Np, Pu, Am). N.Shohoji.
Phys. Status Solidi b (Germany), vol.118, no.2, p.811-22 (1 Aug. 1983).
Statistical thermodynamics is applied to available equilibrium hydrogen pressure-temperature-composition relationships for cubic hyperstoichiometric dihydrides, MH_{2+x}($0<x<1$, M=La, Ce, Pr, Nd, Sm; Np, Pu, Am). A statistical model is constructed based on a perfect face centred cubic lattice of metal atoms with fully occupied tetrahedral interstitial sites by hydrogen atoms and partly and randomly occupied octahedral interstitial sites by the rest of hydrogen atoms. Atomic partition function of hydrogen in MH_{2+x} is found to be similar for all MH_{2+x}. On the other hand, the atomic partition function of metals in MH_{2+x} for different M is found to be different. (24 refs.)

107596 Calculation of the Lennard-Jones *n-m* potential energy parameters for metals. S.Zhen, G.J.Davies (Dept. of Metall., Univ. of Sheffield, Sheffield, England).
Phys. Status Solidi a (Germany), vol.78, no.2, p.595-605 (16 Aug. 1983).
A new approach is developed to calculate the Lennard-Jones *n-m* potential energy parameters for metals whose structure are f.c.c., b.c.c., or h.c.p. using available experimental data. The potential parameters are fitted to the cohesive energy, zero point volume, and zero point compressibilty. The results show improved consistency in comparison with previous work. (18 refs.)

107598 X-ray study of the kinetics of ordering in the Cu_3 Au alloy. F.A.Awni, S.K.Hassun (Dept. of Phys., Coll. of Education, Univ. of Baghdad, Baghdad, Iraq).
Iraqi J. Sci., vol.23, no.3, p.341-54 (1982). [received: Aug. 1983]
A revised calculation has been made in accordance with the Wilson results (1943) using a slightly modified formula, for the probability of an anti-phase-type boundary of Cu_3 Au alloy (Au atoms may be in contact). It is concluded that the relative importance of this type of boundary is smaller than has been assumed. Using the broadening of the superlattice reflections, the probability for two types of boundaries was measured during isothermal ordering at various temperatures. In accordance with electrical conductivity measurements, this study indicates that two different processes of ordering can occur, the second of which corresponds to the movement of domain boundaries. The activation energy for this movement, for both types of boundaries agrees with the value derived from the resistivity measurements. (7 refs.)

107599 Calculation of ordering energy of copper-based solid solutions by the phase shift method. V.S.Stepanyuk, A.A.Katsnel'son, O.T.Malyuchkov, L.I.Yastrebov (Moscow Univ., Moscow, USSR).
Phys. Met. (GB). Translation of: Metallofizika, Kiev (USSR), vol.4, no.3, p.483-8 (1982). [received: Aug. 1983]
The phase shifts of conduction electrons under 'muffin-tin' potential of the host and impurity have been calculated. Friedel's rule of sums has been applied to account for the screening effects so that the atom-atom interaction potential could be expressed in terms of the phase shifts. The potential thus determined has been analyzed, and the ordering energies of dilute Cu-Al, Cu-Au, and Cu-Ni solid solutions as well as of CuZn of equiatomic composition have been determined. (11 refs.)

107600 Electronic structure and tetragonality of martensite. A.Sh.Chavchanidze (Technol. Inst. of Food Industry, Moscow, USSR).
Phys. Met. (GB). Translation of: Metallofizika, Kiev (USSR), vol.4, no.3, p.582-6 (1982). [received: Aug. 1983]
The combination of high strength and high plasticity in steels is largely due to the formation of martensite. High strength of martensite results from tetragonal distortions of its unit cells which impede plastic deformation and shift. The author's aim is to determine the degree of tetragonality of a martensite unit cell, using experimental data on the Mossbauer effect. (12 refs.)

107601 X-ray structure investigation of the Y-{Ti, Cr, Zr, Hf}=Ga alloy system. V.Ya.Markiv, T.G.Zhunkivs'ka, A.M.Belyavina, O.O.Lisenko.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.5, p.81-3 (1983). In Ukrainian.
Alloys of the Y−{Ti, Cr, Zr, Hf}−Ga system are investigated by means of X-ray method. Isothermal sections of constitution diagrams at 800 and 700°C are plotted. The existence of six ternary phases is established. Crystal structure is determined for two compounds: YTi_2Ga_4-($YbMo_2Al_4$ structure type; $a=0.6712$ nm, $c=0.5484$ nm) and Y_2CrGa_3 ($AuCu_3$; $a=0.4289$ nm). (11 refs.)

107602 Structures of Ba_8Ga_7, Sr_8Ga_7 and Sr_8Al_7. M.L.Fornasini (Istituto di Chimica Fisica, Univ. di Genova, Genova, Italy).
Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.8, p.943-6 (15 Aug. 1983).
Ba_8Ga_7, cP60, $M_r=1586.8$, cubic, $P2_13$, $a=12.990$ (6) Å, $V=2192$ Å^3, $Z=4$, $D_x=4.81$ Mg m^{-3}, $\lambda(MoK\alpha)=0.71069$ Å, $\mu(MoK\alpha)=23.4$ mm^{-1}, $F(000)=2660$, $R=0.040$ for 784 reflections. Sr_8Ga_7, $M_r=1189$, $P2_13$, $a=12.484$ (6) Å, $V=1946$ Å^3, $D_x=4.06$ Mg m^{-3}, $\mu(MoK\alpha)=32.7$ mm^{-1}, $F(000)=2084$, $R=0.048$ for 224 reflections. Sr_8Al_7, $M_r=889.8$, $P2_13$, $a=12.753$ (5) Å, $V=2074$ Å^3, $D_x=2.85$ Mg m^{-3}, $\mu(MoK\alpha)=21.6$ mm^{-1}, $F(000)=1580$, $R=0.031$ for 555 reflections. For this last phase a previous structural proposal for equiatomic stoichiometry was revised and the new formula for Sr_8Al_7 determined. The three compounds are isotypic and their structure is characterized by the presence of isolated tetrahedral and triangular clusters of Ga (or Al) atoms included in cages of 16 and 13 alkaline-earth atoms, respectively. (11 refs.)

107603 Structural redetermination of the ThNi phase. M.L.Fornasini (Istituto di Chimica Fisica, Univ. di Genova, Genova, Italy).
Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.8, p.946-7 (15 Aug. 1983).
$M_r=290.8$, orthorhombic, *Pnma*, $a=14.146$ (6), $b=4.286$ (3), $c=5.702$ (3) Å, $V=345.7$ Å^3, $Z=8$, $D_x=11.17$ Mg m^{-3}, $F(000)=944$, room temperature, $\lambda(MoK\alpha)=0.71069$ Å, $\mu(MoK\alpha)=138$ mm^{-1}, final $R=0.049$ for 306 observed reflections. Contrary to the report of Florio et al. (1956), ThNi was found to crystallize in a stacking variant of the CrB-FeB types with trigonal-prismatic coordination of the Ni atoms, and recognized to be isotypic with the SrAg phase, having stacking code $(hc)_2$. (10 refs.)

107604 X-ray diffraction investigation of the structure of deformed samarium-cobalt alloys. Ya.L.Linetskii, Yu.D.Yagodkin (Inst. of Steel & Alloys, Moscow, USSR).
Fiz. Met. & Metalloved. (USSR), vol.56, no.1, p.120-2 (July 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
An investigation was made of the X-ray diffraction effects due to deformation by grinding of sintered and cast samarium-cobalt alloys. The deformation of sintered alloys resulted in the appearance of anomalous diffuse lines near reflections representing the $SmCo_5$ and Sm_2Co_7 phases and in broadening of the diffraction lines of the Sm_2Co_{17} phase. The intensity of the diffuse lines of the $SmCo_5$ phase and their shift away from the main lines were a function of the samarium content in the phase. The X-ray diffractograms of the deformed cast alloys showed no diffuse lines near the reflections of the $SmCo_5$ phase. It was concluded that the interstitial impurities present in large amounts in sintered alloys initiated changes in the structure of the $SmCo_5$ phase during plastic deformation. (6 refs.) *A.T.*

107605 Structural instability of $Hf_xZr_{1-x}V_2$ Laves phases. A.S.Balankin, Yu.F.Bychkov, E.I.Yakovlev (Engng.-Phys. Inst., Moscow, USSR).
Fiz. Met. & Metalloved. (USSR), vol.56, no.1, p.128-33 (July 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A study was made of the temperature dependences of the elastic parameters of $Hf_xZr_{1-x}V_2$ phases in the temperature range 77-1500K. It was found that a reduction in the elastic moduli during cooling of these compounds began at ~1500K. Low-temperature anomalies in the changes of the elastic characteristics were attributed to a successive occurrence of electronic and structural transitions. A study was made of the influence of the composition of the alloys on the stability of the crystal lattice. The different symmetry of the low-temperature phases rich in Hf and Zr resulted in a fundamentally different behaviour of the elastic properties in the course of structural transitions in alloys with $x\geq0.654$ and $x\leq0.459$. (19 refs.) *A.T.*

107606 Local atomic distribution in solid solutions of iron in α and β modifications of manganese. A.S.Ilyushin, I.A.Nikanorova (Dept. of Solid State Phys., Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.5, p.29-33 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.5, p.27-31 (1982).
The local distribution of atoms in solid solutions of iron in α and β modifications of manganese is studied by the methods of X-ray structural analysis of polycrystals and nuclear γ resonance. Concentrational dependences of the distribution of iron and manganese atoms for α and β solid solutions are obtained, and the ordered distribution of iron atoms in the structures of α and β Mn is experimentally observed. It is established that, at the boundaries of single-phase α and β solid solutions, the distribution of iron atoms in α and β Mn stuctures corresponds to the mean statistical distribution, and on this basis it is concluded that the configurational energy plays the decisive role in the stabilization of α and β phases in Mn-Fe alloys. (7 refs.)

107607 Lattice parameters of some ternary NiCu-based solid solutions. I.Lupsa (Phys. Dept., Polytech. Inst., Cluj-Napoca, Rumania), E.Burzo.
Rev. Roum. Phys. (Rumania), vol.28, no.5, p.463-5 (1983).
Presents the results of X-ray measurements on $Ni_4Cu_{1-u-z}Si_z$, Ni_uCu_{1-u-z}-Al_z and $Ni_uCu_{1-u-z}Si_z$, $Ni_uCu_{1-u-z}Al_z$ and $Ni_uCu_{1-u-z}Zn_z$ solid solutions.

The lattice constants decrease as Cu is substituted by Si of Al and increase when Cu is replaced by Zn. (10 refs.)

107608 Crystal structures of the compounds RNiSb with various rare earth elements. V.K.Pecharskii, Yu.V.Pankevich, O.I.Bodak (State Univ., L'vov, Ukrainian SSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.97-8 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.173-4 (Jan.-Feb. 1983). [received: Sept. 1983]
In investigating the phase equilibrium diagram of the Ce-Ni-Sb system the authors discovered a compound of the composition CeNiSb. Investigations of a number of alloys with the composition RNiSb with various rare earth metals revealed the existence of 11 more new compounds. This article gives the results of a determination of their crystal structures. (5 refs.)

107609 The crystal structure and magnetic susceptibility of $LuNi_2Sn$, $YbNi_2Sn$ and $LuNi_4Sn$. R.V.Skolozdra, L.P.Komarovskaya.
Ukr. Fiz. Zh. (USSR), vol.28, no.7, p.1093-5 (July 1983). In Russian.
The X-ray powder analysis method was used to establish the crystal structures of $LuNi_2Sn$, $YbNi_2Sn$ and $LuNi_4Sn$. It is found that $LuNi_2Sn$ and $YbNi_2Sn$ have a $MnCu_2Al$ type structure (superstructure of type CsCl, space group Fm3m) with a=0.6345 nm and a=0.6355 nm respectively. $LuNi_4Sn$ has a structure of the $MgCu_4Sn$ type (superstructure of type $AuBe_5$, space group F43m, a=0.6981 nms). The magnetic susceptibility has been measured in the temperature interval 78 to 293K. $LuNi_2Sn$ and $LuNi_4Sn$ are found to be Pauli paramagnets whilst the susceptibility of $YnNi_2Sn$ is described by the Curie-Weiss law. (5 refs.) *V.G.P.*

107610 Analysis of unit cell dimensions in terms of frameworks and elemental atomic diameters. I. Phases with the $MgCu_2$ structure. E.Hellner (Inst. fur Mineralogie, Univ. Marburg, Marburg, Germany), W.D.Pearson.
Z. Kristallogr. (Germany), vol.163, no.3-4, p.197-213 (1983).
Structural description in terms of frameworks—three-dimensional periodic arrangements of points which are occupied by atoms—is used as the basis of analysing the cell dimensions of phases with the $MgCu_2$ structure (cubic) in terms of the elemental diameters of the component atoms. The $MgCu_2$ structure is described in terms of interpenetrating homogeneous D and T′ frameworks or the heterogeneous [D+T′] framework. The relative influences of the atoms occupying these three frameworks on the cell dimensions of different groups of phases that show distinct dimensional behaviour are determined. The self-coordination of atoms on the T′ framework is six. Some interesting observations are made on whether the basic diameters of atoms on this framework might correspond to a coordination number of six rather than twelve which is the overall coordination number of the atoms on the framework (T′). (14 refs.)

107611 Analysis of unit cell dimensions in terms of frameworks and elemental atomic diameters. II. The contraction of the framework W in the A15 structure. E.Hellner (Inst. fur Mineralogie, Univ. Marburg, Marburg, Germany).
Z. Kristallogr. (Germany), vol.163, no.3-4, p.215-25 (1983).
For pt.I see ibid., vol.163, p.197 (1983). An equation is proposed to calculate the observed cell constants of β-W-(MN_3) structures in terms of framework W occupied by the N atom with diameter D_N for CN12. A contraction term K_N has to be added. The influence of the M atoms is of diameter D_M minus the size of occupied icosahedral void d_M, multiplied with the inclination factor f_M for each type of N atoms. The f_M factors are taken from the plot a_{obs} against D_M. (13 refs.)

61.60 SPECIFIC STRUCTURE OF INORGANIC COMPOUNDS

107612 Structure and electrical properties of new ternary silicides YIr_2Si_2 and $LaIr_2Si_2$. P.Lejay, I.Higashi, B.Chevalier, M.Hirjak, J.Etourneau, P.Hagenmuller (Univ. de Bordeaux I, Talence, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.20, p.1583-6 (6 June 1983). In French.
YIr_2Si_2 has two allotropic varieties with the $ThCr_2Si_2$-type structure (I4/mmm) at low temperature and the $CaBe_2Ge_2$-type (P4/nmm) one which is stable at high temperature. Electrical measurements show that the two polymorphs of YIr_2Si_2 are superconducting below 2.7K, but that $LaIr_2Si_2$, isostructural with the high temperature form of YIr_2Si_2, has a normal metallic behaviour at least down to 1.7K. (8 refs.)

107613 Remarks on the La_2O_3-Li_2O binary system between 750° and 1000°C. F.Abbattista, M.Vallino (Istituto di Chimica Generale e Applicata e di Metall., Politecnico di Torino, Torino, Italy).
Ceram. Int. (Italy), vol.9, no.2, p.35-8 (1983).
The La_2O_3-Li_2O binary system has been re-examined between 750° and 1000°C where $LaLiO_2$ occurs as the only binary compound. It is characterized by a monoclinic cell (a_0=5.88 Å; b_0=6.22 Å; c_0=5.84 Å; β=102.53°) and is isomorphous with α-$EuLiO_2$. Any orthorhombic polymorph of this compound is excluded between 750° to 1000°C. Moreover, the cubic phase (a_0=12.22 Å) reported by previous researchers and said to have a composition close to the $LaLiO_2$ formula, actually belongs to the La-Pt-Li-O system. It has a variable composition: $LaPt_xLi_{1-x}O_{2+1.5x}$ (x=0.14-0.25) and its lattice parameter varies from 12.215 Å (x=0.14) to 2.284 Å (x=0.25). An isomorphous ternary cubic phase, in which titanium replaces platinum, has also been prepared and the lattice parameter of the $LaTi_{0.16}Li_{0.84}O.2_{24}$ compositions is 12.21 Å. (13 refs.)

107614 Study of Ge-Si solid solution crystals by X-ray topography and neutron diffraction. M.L.Kozhukh (Leningrad Inst. for Nuclear Phys., Acad. of Sci., Leningrad, USSR), I.N.Belokurova, S.B.Vakhrushev, A.N.Titkov, I.L.Shul'pina.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.483-7 (1 Aug. 1983).
The structure of Ge-Si solid solution crystals with a gradient of silicon concentration to be used for a thermal neutron monochromator is studied by X-ray topography and neutron diffraction. The effect of the Si-distribution on the crystal structure and such parameters as the rocking curve halfwidth and the peak thermal neutron reflectivity is discussed. (8 refs.)

107615 An X-ray study of an ordered zirconium monocarbide modification. M.P.Arbuzov (Acad. of Sci., Ukrainian SSR), B.V.Khaenko, E.T.Kachkovs'kaya, S.I.Makhovitskaya.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.8, p.73-5 (1983). In Ukrainian.
An ordered zirconium carbide δ′-modification with 40.7 at % C was studied by the X-ray method using crystalline fragments isolated from an ingot. A set of reflections of the ordered zirconium carbide is analogous to the recorded one for the ordered titanium carbide modification in case of isolation of the trigonal TiC_x structure ordered relative to a cubic matrix in all equivalent positions. The conclusion is reached that the ordered zirconium carbide modification is of trigonal structure, the lattice parameters being as follows: $a=\sqrt{2}a_0=0.6638$ nm; $c=2\sqrt{3}a_0=1.6261$ nm. (8 refs.)

107616 Structures of $Pb_3GeGa_{10}O_{20}$ and $Ba_3SnFe_{10}O_{20}$. M.C.Cadee, G.C.Verschoor, D.J.W.Ijdo (Gorlaeus Labs., Leiden State Univ., Leiden, Netherlands).
Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.8, p.921-5 (15 Aug. 1983).
$Pb_3GeGa_{10}O_{20}$: $M_r=1711.3$, $I2/m$, $a=14.751$ (5), $b=11.695$ (5), $c=5.106$ (3) Å, $\beta=90.23$ (3)°, $V=881$ (1) $Å^3$, $Z=2$, $D_x=6.45$ Mg m^{-3}, λ(Mo$K\alpha$)=0.71069 Å, T=291K, single-crystal X-ray diffraction, $R=0.031$ for 1161 observed reflections. The compound is isostructural with $Pb_3GeAl_{10}O_{20}$ and $Ba_3TiAl_{10}O_{20}$. The crystal structure of the also isostructural $Ba_3SnFe_{10}O_{20}$ was determined by a Rietveld refinement of neutron powder diffraction data collected at 873K, with the results of the structure determination of $Pb_3GeGa_{10}O_{20}$ as starting parameters: $M_r=1409.2$, $I2/m$, $a=15.4430$ (5), $b=11.9068$ (4), $c=5.2473$ (2) Å, $\beta=90.945$ (2)°, $V=964.7$ (1) $Å^3$, $Z=2$, $D_x=4.85$ Mg m^{-3}, $R_I=0.051$ for 208 measured reflections, $\mu R=0.275$. The structure consists of a framework of six-membered rings of tetrahedra, which form a ribbed plane. These planes are connected by a string of octahedra and by an M^{2+} ion in octahedral coordination. The other M^{2+} ion is situated inside the rib of the ribbed plane and has irregular seven or eight coordination, which is best described as a mono- or bicapped trigonal prism (M^{2+} is Pb^{2+} or Ba^{2+}). (14 refs.)

107617 A neutron diffraction determination of the structure of deuterated aluminium nitrate nonahydrate, $Al(NO_3)_3.9D_2O$. K.Hermansson (Inst. of Chem., Univ. of Uppsala, Uppsala, Sweden).
Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.8, p.925-30 (15 Aug. 1983).
$M_r=393.26$, monoclinic, $P2_1/c$, $a=13.8937$ (14), $b=9.6258$ (7), $c=10.9127$ (7) Å, $\beta=95.66$ (1)°, $V=1452.3$ (2) $Å^3$, T=295K [the cell parameters were determined from the refinement of 39 θ values from a Guinier-Hagg X-ray powder film (Cr$K\alpha$ radiation, λ=2.28975 Å, using a CoP_3 standard: $a=7.70778$ Å)], $Z=4$, $D_x=1.80$ Mg m^{-3}, final $R_w(F^2)=0.069$ for all 4480 independent reflections collected out to sinθ/λ=0.69 $Å^{-1}$. The crystal structure of $Al(NO_3)_3.9D_2O$ has been studied by three-dimensional neutron diffraction data collected at 295K. The asymmetric unit contains $Al(D_2O)_6{}^{3+}$ octahedra, $NO_3{}^-$ ions and three D_2O molecules which are not coordinated to Al^{3+} ions. All nine water molecules in the formula unit are crystallographically independent and the 19 hydrogen bonds donated have O...O distances in the range 2.650 (2)-3.054 (2) Å. The hydrogen bonds donated by the D_2O molecules which are coordinated to Al^{3+} ions are shorter than the other hydrogen bonds. A distinct correlation exists between the O-D and D...O distances. (13 refs.)

107618 The structure and electron deformation density of $LiNO_2.H_2O$ at 295K. K.Hermansson, J.O.Thomas (Inst. of Chem., Univ. of Uppsala, Uppsala, Sweden).
Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.8, p.930-6 (15 Aug. 1983).
$M_r=70.959$, monoclinic, $P2_1/c$, $Z=4$, $a=3.3387$ (3), $b=14.2980$ (10), $c=6.3961$ (5) Å, $\beta=105.10$ (1)°, $V=294.79$ (4) $Å^3$, $D_x=1.60$ Mg m^{-3}, Mo$K\alpha$, λ=0.71069 Å, $\mu_{calc}=0.154$ mm^{-1}, T=295 K, $F(000)=144$. Two data sets were collected out to sinθ/λ=0.91 $Å^{-1}$: one on a twinned crystal, the other on a single crystal. Positional and thermal parameters from the two data sets show only random deviations. Somewhat high $R_w(F^2)$ values of 0.084 and 0.081, respectively, resulted from the refinement of a spherical-atom model. This reflects the inadequacies of such a model. Introduction of multipolar deformation functions for the single-crystal data set brought the $R_w(F^2)$ value down to 0.029. The crystal contains one independent Li^+ ion with fivefold coordination, a tetrahedrally coordinated H_2O molecule and an $NO_2{}^-$ ion which accepts two medium-strength hydrogen bonds [O-H...O 2.755 (1); O-H...N 2.890 (1) Å] and has three Li^+-O contacts. The static deformation density for the $NO_2{}^-$ ion shows N-O bond maxima of 0.50 e $Å^{-3}$; O lone-pair maxima of 0.20-0.30 e $Å^{-3}$ are situated in the molecular planes at approximately 90° to the N-O bonds. The lone-pair density associated with the water O is markedly asymmetric; no support for this effect has been found in theoretical model calculations, however. (27 refs.)

107619 Structure of the triple orthophosphate of magnesium and sodium, $NaMg_4(PO_4)_3$. M.Ben Amara, M.Vlasse, R.Olazcuaga, G.Le Flem, P.Hagenmuller (Lab. de Chimie du Solide, Univ. de Bordeaux I, Talence, France).
Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.8, p.936-9 (15 Aug. 1983). In French.
$M_r=405.2$, orthorhombic, $Pnma$, $a=9.883$ (2), $b=6.345$ (2), $c=15.240$ (3) Å, $V=955.7$ $Å^3$, $Z=4$, $D_m=2.84\pm0.05$, $D_x=2.82$ Mg m^{-3}, room temperature, λ(Mo$K\alpha_1$)=0.70942 Å, $\mu=10.16$ cm^{-1}, $F(000)=800$. The structure has been refined with 1325 single-crystal diffractometer data to $R=0.053$. The three-dimensional lattice is made up of isolated $[PO_4]$ tetrahedra linked together by Mg and Na atoms. A strong $[MgO_5]$ polyhedral sublattice appears with voids occupied by the Na atoms. (11 refs.)

107620 Tetraaquatrinitratoneodymium(III) dihydrate, $[Nd(NO_3)_3(H_2O)_4].2H_2O$ [crystal structure]. D.J.Rogers, N.J.Taylor, G.E.Toogood (Dept. of Chem., Univ. of Waterloo, Waterloo, Ontario, Canada).
Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.8, p.939-41 (15 Aug. 1983).
$M_r=438.35$, triclinic, $P\bar{1}$, $a=9.307$ (1), $b=11.747$ (1), $c=6.776$ (1) Å, $\alpha=91.11$ (1), $\beta=112.24$ (1), $\gamma=109.15$ (1)°, $V=639.0$ (2) $Å^3$, $Z=2$, $D_m=2.27$, $D_x=2.278$ Mg m^{-3}, λ(Mo$K\alpha$)=0.71069 Å, $\mu=4.192$ mm^{-1}, $F(000)=426$, T=298K. Final $R=0.020$ (including H atoms) for 3311 observed reflections. Three symmetrically bidentate nitrates and four coordinated water molecules produce a formally ten-coordinate neodymium. However, the structure is best visualized as a tetragonal base-trigonal base seven-coordinate arrangement, with each nitrate considered as occupying only

one coordination site. Two additional water molecules per unit are hydrogen-bonded, both inter- and intramolecularly, but are not directly coordinated to the metal. The overall arrangement is very nearly mirror-symmetrical. (15 refs.)

107621 Calcium cesium triazide monohydrate, $CaCs(N_3)_3.H_2O$ [crystal structure]. H.Krischner, F.A.Mautner (Inst. fur Phys. und Theoretische Chem., Tech. Univ. Graz, Graz, Austria), C.Kratky.
Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.8, p.941-3 (15 Aug. 1983).
$M_r=317.06$, triclinic, $P\bar{1}$, $a=6.846$ (1), $b=7.557$ (1), $c=8.810$ (1) Å, $\alpha=71.59$ (1), $\beta=82.80$ (1), $\gamma=81.09$ (1)°, $V=425.82$ Å^3, $Z=2$, $D_x=2.47$ Mg m^{-3}, $F(000)=304.01$, Mo$K\alpha$, $\lambda=0.71069$ Å (graphite monochromator), $\mu=4.9$ mm^{-1}, $T=298$K. The crystal structure was solved by Patterson and Fourier methods and refined to $R=0.034$ for 1475 independent counter reflections. Ca is seven-coordinated to six N atoms of azide groups and to one water molecule. The polyhedra around Ca are pentagonal bipyramids sharing one edge. Cs is nine-coordinated to eight azide groups and one water molecule. The mean N-N distance is 1.17 (2) Å. (9 refs.)

107622 Structure of the octachloride of tricadmium calcium 8.5-hydrate, $2[Ca(H_2O)_7].[Cd_6Cl_{16}(H_2O)_2]\infty.H_2O$. H.Leligny, J.C.Monier (Lab. de Cristallographie, Univ. de Caen, Caen, France).
Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.8, p.947-52 (15 Aug. 1983). In French.
$Cd_3CaCl_8.8.5H_2O$, $M_r=814.02$, $P\bar{1}$, $a=12.257$ (2), $b=12.212$ (2), $c=14.790$ (1) Å, $\alpha=83.28$ (1), $\beta=73.75$ (1), $\gamma=78.12$ (1)°, $V=2075.67$ Å^3, $Z=4$, D_m (flotation)$=2.59\pm1$, $D_x=2.606$ Mg m^{-3}, Mo$K\bar{\alpha}$, $\gamma=0.71069$ Å, $\mu=4.29$ mm^{-1}, $T=293$K, $F(000)=1540$. The structure was refined by least-squares calculations to a final $R=0.022$ for 4300 measured independent reflections with $I>4\sigma(I)$. Crystals were obtained from an evaporated aqueous solution of calcium chloride and cadmium chloride. Cd atoms are octahedrally coordinated to either $CdCl_6$ or $CdCl_5O_w$; Ca atoms are surrounded by seven O atoms of water molecules located on triangular prisms with monocapped tops; one water molecule is not coordinated to cations. The structure is described as infinite octahedra of double $CdCl_6$ chains packed along $[1\bar{1}0]$, connected by cross-bars of two $CdOCl_5$ octahedra making up two-dimensional layers (111) linked by Ca coordination polyhedra via OH...Cl hydrogen bonds. The question of $P1$ or $P1$ symmetry is discussed. (19 refs.)

107623 Structure refinement of strontium nitrate, $Sr(NO_3)_2$, and barium nitrate, $Ba(NO_3)_2$. H.Nowotny (Inst. fur Mineralogie und Kristallographie, Univ. Wien, Wien, Austria), G.Heger.
Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.8, p.952-6 (15 Aug. 1983).
$Sr(NO_3)_2$: $M_r=211.63$, cubic, $Pa3$, $a=7.7813$ (2) Å (McMurdie et al., 1975), $U=471.15$ Å^3, $Z=4$, $D_x=2.98$ Mg m^{-3}, μ[neutrons $\lambda=0.8972$ (2) Å]$=0.002$ mm^{-1}, room temperature. $Ba(NO_3)_2$: $M_r=261.35$, $Pa3$, $a=8.1184$ (2) Å (Swanson et al., 1974), $U=535.07$ Å^3, $Z=4$, $D_x=3.24$ Mg m^{-3}, $\mu=0.002$ mm^{i-1}, room temperature. The atomic arrangements were refined at room temperature with single crystal neutron diffraction data: $Sr(NO_3)_2$ to $R=0.020$ ($R_w=0.019$) for 330 reflections and $Ba(NO_3)_2$ to $R=0.024$ ($R_w=0.022$) for 351 reflections. The N-O bond lengths (uncorrected for thermal vibration) are 1.2467 (5) and 1.2465 (6) Å, the deviations of the N atoms from the planes defined by the O atoms of the nitrate groups are 0.005 (1) and 0.006 (1) Å, respectively. The amplitudes of the thermal vibrations have normal values. (33 refs.)

107624 Calcium sulphate subhydrate, $CaSO_4.0.8H_2O$ [crystal structure]. W.Abriel (Fachbereich Chem., Philipps-Univ., Marburg, Germany).
Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.8, p.956-8 (15 Aug. 1983). In German.
$M_r=150.6$, trigonal, $P3_121$, $a=6.968$ (8), $c=6.410$ (4) Å, $V=269.5$ Å^3, $Z=3$, $D_x=2.63$ g cm^{-3}, λ(Mo$K\alpha$)$=0.7107$ Å, $\mu=20.24$ cm^{-1}, room temperature, $F(000)=228$. Using 286 reflexions with $I>3\sigma(I)$, including Friedel pairs, one of the two possible enantiomorphous space groups could be rejected by statistical methods (final $R=0.05$). Chains of alternating Ca^{2+} and $SO_4{}^{2-}$ ions parallel to the c axis form the framework of a tunnel structure in which four water molecules are randomly distributed over five tunnel positions. The Ca^{2+} ion is surrounded by six $SO_4{}^{2-}$ groups (similar to the arrangement in anhydrite) and one water molecule, counting the nine nearest O atoms (distances 2.45-2.66 Å). (19 refs.)

107625 Dithallium trisulphur trinitride-tetrasulphur pentanitride, $Tl_2S_7N_8$ [crystal structure data]. H.Martan, J.Weiss (Anorganisch-Chem. Inst., Univ. Heidelberg, Heidelberg, Germany).
Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.8, p.959-60 (15 Aug. 1983). In German.
$M_r=745.2$, orthorhombic, $Pmnb$, $a=9.281$ (2), $b=11.380$ (2), $c=11.714$ (2) Å, $V=1237$ Å^3, $Z=4$, $D_x=4.00$ g cm^{-3}, Mo$K\alpha$ radiation, $\lambda=0.71096$ Å, $\mu=274$ cm^{-1}, room temperature, $F(000)=1320$, final $R=0.047$ for 1225 unique reflections. The structure consists of Tl^+ cations and $(S_3N_3)^-$ and $(S_4N_5)^-$ anions. (12 refs.)

107626 Structure of cesium fac-trichlorotrioxorhenate(VII), $Cs_2[ReCl_3O_3]$. T.Lis (Inst. of Chem., Wroclaw Univ., Wroclaw, Poland).
Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.8, p.961-2 (15 Aug. 1983).
$M_r=604.4$, orthorhombic, $Pnam$, $a=10.499$ (9), $b=12.57$ (1), $c=7.000$ (6) Å, $V=923.8$ Å^3, $Z=4$, $D_x=4.36$ Mg m^{-3}, λ(Mo$K\alpha$)$=0.71069$ Å, $\mu=22.6$ mm^{-1}, $F(000)=1040$, $T=296$ (2)K. Final $R=0.066$ for 1378 non-zero reflexions. The $[ReCl_3O_3]^{2-}$ anion has crystallographic point symmetry m (C_s) but approximates closely to $3m$ (C_{3v}) symmetry. The average bond lengths and bond angles are: Re-Cl 2.50 (1), Re-O 1.70 (2) Å, Cl-Re-Cl 81.5 (3), O-Re-O 103.1 (9)°. (9 refs.)

107627 Structure of solid carbon diselenide (CSe_2) at 17.5, 50 and 200K. B.M.Powell (Chalk River Nuclear Labs., AECL, Chalk River, Ontario, Canada), B.H.Torrie.
Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.8, p.963-5 (15 Aug. 1983).
$M_r=169.9$, orthorhombic, $Cmca$, $Z=4$. At 17.5K: $a=6.5021$ (4), $b=5.7599$ (4), $c=8.9907$ (7) Å, $V=336.71$ (9) Å^3, $D_x=3.35$ Mg m^{-3}, $R_{wp}=9.7\%$. The crystal structure of CSe_2 has been determined at 17.5, 50 and 200K using neutron powder profile refinement with a wavelength of 1.9887 Å. The C-Se bond length is 1.689 (3) Å, oriented at 41.60 (10)° to the b axis in the bc plane. The structure is similar to that of CS_2 and the lattice parameter c shows the same anomalous temperature dependence. (7 refs.)

107628 Structure of monoclinic nickel sulphate hexadeuterate, $NiSO_4.6D_2O$. H.Ptasiewicz-Bak, G.J.McIntyre, I.Olovsson (Inst. of Chem., Univ. of Uppsala, Uppsala, Sweden).
Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.8, p.966-8 (15 Aug. 1983).
$M_r=274.92$, monoclinic, $C2/a$, $c=9.880$ (3), $b=7.248$ (4), $c=24.171$ (9) Å, $\beta=98.46$ (3)°, $V=1712.0$ Å^3, $Z=8$, $D_x=2.133$ g cm^{-3}, Mo$K\alpha$, $\lambda=0.71069$ Å, $\mu=25.4$ cm^{-1}, $T=295$K, $F(000)=1088$, final $R=0.061$ for 354 reflections. The structure was solved using constrained refinement of the orientations of the NiO_6 and SO_4 groups. Eleven of the twelve crystallographically independent hydrogen bonds are between water and sulphate O atoms; the twelfth is between two water O atoms. (9 refs.)

107629 Structure of the ordered phase of gallium sesquiselenide, Ga_2Se_3. G.Ghemard, S.Jaulmes, J.Etienne, J.Flahaut (Lab. de Chimie Minerale Structurale, Faculte des Sci., Paris, France).
Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.8, p.968-71 (15 Aug. 1983). In French.
$M_r=376.32$, monoclinic, Bb, $a=b=6.66$ (1), $c=11.65$ (1) Å, $\gamma=108.12$ (1)°, $V=491.1$ Å^3, $Z=4$, D_m(flotation)$=4.95$ (2), $D_x=5.09$ g cm^{-3}, λ(Mo$K\bar{\alpha}$)$=0.7107$ Å, μ(Mo$K\bar{\alpha}$)$=328$ cm^{-1}, $F(000)=656$, room temperature. The entirely ordered monoclinic phase of Ga_2Se_3 is a superstructure of the basic distorted sphalerite-type. The structure has been solved by Fourier methods and refined by full-matrix least-squares calculations, to a final $R=0.067$, for 804 observed reflexions collected with a four-circle diffractometer. Ordering of metal vacancies involves two different Se-atom surroundings, infinite chains of vacancies, running in the **b** direction, and the particular stacking sequence *abca′b′c′* derived from *ABC* cubic close packing, for Ga atoms. (9 refs.)

107630 On III-V-VI compounds: structural study of thallium antimony disulphide, $TlSbS_2$. N.Rey, J.C.Jumas, J.Oliveier-Fourcade, E.Philippot (Lab. de Chimie Minerale C, Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.8, p.971-4 (15 Aug. 1983). In French.
$M_r=390.2$, triclinic, $P\bar{1}$, $a=6.123$ (6), $b=6.293$ (10), $c=11.838$ (13) Å, $\alpha=101.34$ (7), $\beta=98.39$ (5), $\gamma=103.21$ (19)°, $Z=4$, $V=427$ Å^3, D_m(pycnometry)$=6.09$, $D_x=6.07$ Mg m^{-3}, λ(Mo$K\alpha$)$=0.71069$ Å, μ(Mo$K\alpha$)$=45.17$ mm^{-1}, $F(000)=1000$. The crystal structure was solved by the symbolic addition method and refined by least squares to a final $R=0.064$, $R_w=0.097$ (1160 observed reflections). The structure is built up from sheets, parallel to the (010) plane, formed by SbS_4E trigonal bipyramids which are linked together. Sb atoms have four bonds to S atoms of 2.41-2.96 Å. The Sb lone pair of electrons (E) is stereochemically active. These sheets are linked together by weak Tl...S (3.50-3.66 Å), Tl...Sb (3.60-3.73 Å) and Tl...Tl (3.62 Å) interactions. (19 refs.)

107631 New compounds with the structure of tetragonal potassium-tungsten bronze. Z.V.Bondarenko, V.S.Filip'ev, V.G.Kryshtop, R.U.Devlikanova, E.G.Fesenko (Rostov-on-Don State Univ., Rostov, USSR).
Inorg. Mater. (USA), vol.18, no.8, p.1116-18 (Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.,* vol.18, no.8, p.1320-2 (Aug. 1982).
Sixteen new compounds have been synthesized for the first time and their unit cell parameters have been determined. Anomalies were found in the behaviour of ϵ and tan δ with temperature in the compounds $Ba_6Nb_8Sn_2O_{30}$, $Ba_6Nb_9InO_{30}$, and $Ag_2Pb_4Nb_{10}O_{30}$. It was established that $Ag_2Pb_4Nb_{10}O_{30}$ is ferroelectric. The difficulties in the synthesis of ternary strontium-containing niobates with a tetragonal potassium tungsten bronze structure are due to the formation of stable phases based on $Sr_2Nb_2O_7$ and $SrNb_2O_6$ in the first step of the synthesis. The structure can be stabilised in this case by introducing more electropositive elements into the A-positions. (5 refs.)

107632 Predicting cation distribution in spinels by the potential-function method. V.M.Talanov, L.A.Frolova (Sergo Ordzhonikidze Novocherkassk Polytech. Inst., USSR).
Inorg. Mater. (USA), vol.18, no.8, p.1171-3 (Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.,* vol.18, no.8, p.1380-2 (Aug. 1982).
The possibility of predicting cation distribution in AB_2O_4 spinels with the potential-function method has been demonstrated. (6 refs.)

107633 Investigation of the structure of hematite on the basis of an analysis of the physical broadening of X-ray lines. V.I.Fadeeva, L.A.Panchenko (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
Inorg. Mater. (USA), vol.18, no.8, p.1193-6 (Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.,* vol.18, no.8, p.1399-401 (Aug. 1982).
The mean Fourier coefficients of the broadening of X-ray lines for each compound with a similar structure are expressed by the formula $K_{hkil}=[d_{hkil}(a'\alpha_1+b'\alpha_2+c'\beta).\ |l|]/c^2$, where α_1, α_2, and β are the probabilities of the formation of packing defects due to half- and quarter-dislocations and twins; a', b', and c' are the coefficients of the contribution of each type of packing defect taken from the total Fourier coefficients; c is the lattice constant; and d_{hkil} is the interplanar distance. The values of K_{hkil} for some diffraction reflections of hematite powders with the constants of the hexagonal cell $a=5.034\pm0.001$ Å and $c=13.744\pm0.001$ Å are given. The $(01\bar{1}2)$, $(11\bar{2}3)$, $(02\bar{2}4)$, $(30\bar{3}0)$, and $(22\bar{4}6)$ lines were selected for the differentiated determination of the parameters of the fine crystal structure. The procedure for calculating the parameters of the substructure was experimentally tested on hematite powders known to contain nonequilibrium defects. (6 refs.)

107634 Crystal chemistry of rare-earth phosphates. K.K.Palkina (N.S. Kurchatov Inst. of General & Inorganic Chem., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.9, p.1199-22 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.,* vol.18, no.9, p.1413-36 (Sept. 1982). [received: Sept. 1983]
In the series of simple rare-earth phosphates, with an increase in the degree of condensation of the anion the author observes a degree of connectedness of the cation polyhedra, ranging from complete connectedness in orthophosphates to discreteness in ultraphosphates. In compounds of the type $M^IM^{III}(PO_3)_4$, with an increase in the difference between the sizes of the cations of the alkali metal and the trivalent metal (in favor of a relative decrease in the size of M^{III}), the possibility arises for complication of the shape of the polyphosphate chains and formation of rings. Thus, from the sizes of the cations one may also predict the probability that the phosphate anions will appear in the form of large rings. The author has pointed out promising systems with an increased alkali metal content for possibly obtaining compounds which contain large rings. A correlation between the structural characteristics and the luminescent properties of double poly- and cyclophosphates of Nd and alkali metals has been found. (49 refs.)

107635 A neutron diffraction study of the zeolite edingtonite. A.Kvick (Dept. of Chem., Brookhaven National Lab., Upton, NY, USA), J.V.Smith.
J. Chem. Phys. (USA), vol.79, no.5, p.2356-62 (1 Sept. 1983).
A neutron diffraction study at 294K of a single crystal of edingtonite ($Ba_2Al_4Si_6O_{20}.7H_2O$; **a** 9.537(3) **b** 9.651(2) **c** 6.509(2) A; $P2_12_12$) utilized 1876 diffraction intensities from the Brookhaven National Laboratory high-flux beam reactor. The agreement factor $R(F^2)=0.055$ for conventional anisotropic refinement was reduced to 0.045 for a Gram-Charlier expansion up to fourth order for the thermal factors of the water atoms. The Si-O and Al-O distances correlate inversely with the Si-O-Al angle as in scolecite. There is no indication of substitutional disorder. The barium atom is coordinated to three pairs of framework oxygens (2.89, 2.96, and 3.04 Å) and two pairs of water oxygens (2.79 and 2.79 Å). Two framework oxygens have weak hydrogen bonds to both water molecules [0(4)−OW(1) 2.87, −OW(2) 2.96; O(5) −OW(1) 3.02, −OW (2) 3.02 Å] and the other three framework oxygens are each bonded to a Ba atom. The OW−H...O angles (163.5°, 165.1°, 173.9°, and 178.0°) are fairly close to 180°, the H...O distances are long (1.91, 2.02, 2.09, and 2.10 Å) and the observed uncorrected OW−H

distances range from 0.928(6) to 0.959(4) Å. Only seven out of the eight water positions are occupied [W(1) 84% occupancy; W(2) 91%]. The average r.m.s. displacement of each hydrogen (0.32, 0.29, 0.27, and 0.24 Å) correlates approximately with the hydrogen bond length (2.09, 2.10, 2.02, and 1.91 Å). Third- and fourth-order tensor components in the displacements of the water molecules may result from anharmonic or curvilinear vibrations; however, the effect of the static displacements of the center-of-motion from interaction with unoccupied water sites may also be important. (29 refs.)

107636 X-ray diffraction study of monoclinic RbD_2PO_4. S.Suzuki, K.Arai (Dept. of Appl. Phys., Sci. Univ. of Tokyo, Tokyo, Japan), M.Sumita, Y.Makita.

J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2394-400 (July 1983).

The crystal structure of monoclinic RbD_2PO_4 at room temperature was determined by use of an automatic four-circle X-ray diffractometer, and the superlattice structure was examined. The crystal, which undergoes phase transitions at 44°C and 104°C, belongs to the space group $P2_1$ in the lowest (III) phase and $P2_1/m$ in the highest (I) phase. The former space group is consistent with the recent result that the crystal in the phase III is approximately antiferroelectric, but weakly polar along the *b* axis. There are two kinds of hydrogen (deuterium)-bond chains: one along the *b* axis and the other along the *c* axis. It is suggested that the deuterium atoms in the former chains along the *b* axis are ordered in the phase III and disordered in the phases I and II, while those along the *c* axis are ordered even in the phase I. The space group of the intermediate (II) phase is suggested to be $P2_1/n$.

107637 A model for in-plane structure of high-stage alkali-metal graphite intercalation compounds. M.Suzuki (Dept. of Phys., Ochanomizu Univ., Tokyo, Japan), H.Suematsu.

J. Phys. Soc. Jpn. (Japan), vol.52, no.8 p.2761-8 (Aug. 1983).

The authors propose a unified picture for the intercalant-layer ordered structure of the high-stage alkali-metal graphite intercalation compounds; the in-plane structure is described in terms of a $(\sqrt{7}\times\sqrt{7})R19.11°$ superlattice which is modulated by honeycomb-like domains (discommensuration structure). In this model, the domain size and the rotation angle of the domain structure relative to the graphite lattice are uniquely determined by the magnitude of the fundamental reciprocal lattice vector of the intercalant layer.

107638 Three crystalline polymorphs of $KFeSiO_4$, potassium ferrisilicate. J.J.Bentzen (Inst. of Ceramics, Tech. Univ. of Denmark, Lyngby, Denmark).

J. Am. Ceram. Soc. (USA), vol.66, no.7, p.475-9 (July 1983).

Orthorhombic α-$KFeSiO_4$ ($a=0.5478$, $b=0.9192$, $c=0.8580$ nm), hexagonal β-$KFeSiO_4$ ($a=0.5309$, $c=0.8873$ nm), and hexagonal γ-$KFeSiO_4$ ($a=0.5319$, $c=0.8815$ nm) were synthesized by devitrification of $KFeSiO_4$ glass. Powder X-ray diffraction data are given for all three polymorphs. Alpha $KFeSiO_4$, the high-temperature polymorph, melts congruently at 1197°±2°C. Mossbauer spectroscopy of the α phase indicates that Fe^{3+} occupies two tetrahedral sites in the lattice. Beta $KFeSiO_4$, the low-temperature polymorph, and γ-$KFeSiO_4$, a metastable polymorph, appear to be isomorphous with kalsilite, $KAlSiO_4$, and synthetic kaliophilite, $KAlSiO_4$, respectively, and it is proposed that β- and γ-$KFeSiO_4$ are linked by Si-Fe order-disorder. Beta $KFeSiO_4$ transforms slowly into α-$KFeSiO_4$ above 910°C but the transformation was not shown to be reversible in the present dry-heating experiments. (16 refs.)

107639 The crystal structure of $Ba_2Ti_9O_{20}$: a hollandite related compound. G.D.Fallon, B.M.Gatehouse (Chem. Dept., Monash Univ., Clayton, Victoria, Australia).

J. Solid State Chem. (USA), vol.49, no.1, p.59-64 (Aug. 1983).

$Ba_2Ti_9O_{20}$ crystallizes in the triclinic system with unit cell dimensions (from single crystal data) $a=14.358(4)$, $b=14.095(4)$, $c=7.477(1)$ Å, $\alpha=95.53(3)$, $\beta=100.55(3)$, $\gamma=89.95(2)°$, and space group $P\bar{1}$, $z=4$. The structure was solved using Patterson ('P1' method) and Fourier techniques. Of the 8625 unique reflections measured by counter techniques, 3767 with $I\geq 3\sigma(I)$ were used in the least-squares refinement of the model to a conventional R of 0.057 ($R\omega=0.054$). The structure of $Ba_2Ti_9O_{20}$ is very similar to that of hollandite except that additional barium ions replace oxygen ions and disrupt the tunnel walls resulting in the formation of cavities, rather than tunnels, that contain two barium ions per cavity. (24 refs.)

107640 A neutron powder diffraction study of the κ phase in the Fe-W-C system. A.Harsta, S.Rundqvist, J.O.Thomas (Inst. of Chem., Univ. of Uppsala, Uppsala, Sweden).

J. Solid State Chem. (USA), vol.49, no.1, p.118-22 (Aug. 1983).

The crystal structure of the κ-carbide in the Fe-W-C system has been refined from neutron powder diffraction data using the Rjetveld profile analysis method. κ-(Fe-W-C) is isostructural with κ-(Co-W-C); space group $P6_3/mmc$; unit cell dimensions $a=7.7982(2)$ Å, $c=7.8298(4)$ Å. The structure refinement indicates Fe/W substitution at two of the tungsten sites, and 46% vacancies at one of the carbon sites. The composition corresponds to the formula $Fe_{3+x}W_{10-x}C_{4-y}$, with $x=0.57(3)$ and $y=0.46(1)$. (17 refs.)

107641 A study on the morphological changes due to reduction of WO_3 to α-W. Chae Gyoo Chang (Seoul Nat. Univ., Seoul, Korea), Hyong Yong Ra.

J. Korean Inst. Met., vol.21, no.5, p.489-99 (May 1983). In Korean.

Morphological changes of intermediate tungstic oxide particles, prepared by reducing WO_3 with hydrogen and a mixture of hydrogen and nitrogen over the temperature range from 800°C to 1000°C, were studied using a scanning electron microscope. Two different morphologies of $W_{18}O_{49}$, bundles of needle crystals and short pole-type particles, were obtained at 800°C, whereas $W_{18}O_{49}$, obtained at 900°C and above, consisted of pole-type particles and fine whiskers. The growth of $W_{18}O_{49}$ particles was faster in length than width with increasing reduction temperature. The size and morphologies of $W_{18}O_{49}$ particles were greatly influenced by those of WO_3 particles. Transformation of $W_{18}O_{49}$ to WO_2 and WO_2 to α-W was accompanied by the rounding of $W_{18}O_{49}$ particles and the recrystallization of α-W in spherical shape respectively. Extremely fine α-W powder was obtained by reduction of WO_3 powder at 500°c for 4 hrs in hydrogen followed by immediate reduction at 650°C for 1 hr. (21 refs.)

107642 Microstructure and stability of iron chloride graphites. R.Schlogl, P.Bowen, G.R.Millward, W.Jones (Dept. of Phys. Chem., Univ. of Cambridge, Cambridge, England), H.P.Boehm.

J. Chem. Soc. Faraday Trans. I (GB), vol.79, pt.8, p.1793-818 (Aug. 1983).

Two methods have been used to prepare iron chloride intercalates of natural graphite. Ferric chloride intercalates are demonstrated to be both extremely air sensitive and also to undergo gradual physical and chemical changes upon storage, solvent treatment, heating and washing. Gradual interconversion to higher staging or direct deintercalation are the two observed reaction pathways. The ferrous chloride intercalates (obtained by H_2 reduction) are found to be even more air sensitive than their ferric precursors, decomposing to yield disordered graphite and crystalline iron chloride hydrates and oxyhydrates. The limitations of different techniques to the study of graphite intercalates (including Mossbauer spectroscopy, X-ray powder diffraction, thermogravimetric analysis, weight-uptake measurements and electron microscopy) are discussed. (43 refs.)

107643 Structural properties of HNO_3-graphite intercalation compounds studied by neutron diffraction and high energy nuclear photon scattering. H.Pinto, M.Melamud, O.Shahal (Phys. Dept., Nuclear Res. Center-Negev, Beer Sheva, Israel), R.Moreh, H.Shaked.

Physica B & C (Netherlands), vol.121B+C, no.1-2, p.121-6 (1983).

The results of a study of the orientation of the NO_3^- planes in a second and third stage normal HNO_3 intercalate in highly oriented pyrolytic graphite are reported. Two different techniques were used: (i) Neutron diffraction and (ii) high energy nuclear resonance photon scattering. The latter is a novel technique, developed recently, which utilizes the ^{15}N isotope. It senses the anisotropy in the molecular vibrations of ^{15}N through the Doppler broadening of the 6.324 MeV nuclear level. Using a second stage sample, at room temperature, the two techniques yielded the unambiguous result that the NO_3^- planes are perpendicular to the graphite planes. Another sample consisting of a third stage intercalate together with a second stage admixture was studied using the photon scattering technique and was found to have essentially the same perpendicular configuration. (11 refs.)

107644 X-ray diffraction study of the crystal structures of K_2CuF_4 and $K_2Cu_xZn_{1-x}F_4$. M.Hidaka, K.Inoue (Dept. of Phys., Kyushu Univ., Fukuoka, Japan), I.Yamada, P.J.Walker.

Physica B & C (Netherlands), vol.121B+C, no.3, p.343-50 (Aug. 1983).

The investigation of the crystal structures of K_2CuF_4 and its diluted system $K_2Cu_xZn_{1-x}F_4$ has been made by means of an X-ray camera and counter method. Both the pure ($x=1$) and the diluted compounds were found to have two kinds of structures, an ordered and a disordered type. The ordered K_2CuF_4 generally shows a multi-domain structure, which means that a single domain sample is orthorhombic, $D_{2h}{}^{18}$-Bbcm. On the contrary, the ordered $K_2Cu_xZn_{1-x}F_4$ with $x<\approx 0.9$ has a tetragonal symmetry due to the absence of a correlation between the displacement of F^- ions around the body-centered Cu^{2+} ion with respect to those in the basal plane. Some comments concerning the magnetic structures of the pure and the diluted systems are given on the basis of the present crystallographic analyses. (12 refs.)

107645 X-ray- and neutron-diffraction measurements on $BaMnF_4$. D.E.Cox, S.M.Shapiro (Brookhaven Nat. Lab., Upton, NY, USA), R.J.Nelmes, T.W.Ryan, H.J.Bleif, R.A.Cowley, M.Eibschutz, H.J.Guggenheim.

Phys. Rev. B (USA), vol.28, no.3, p.1640-3 (1 Aug. 1983).

X-ray- and neutron-diffraction measurements on powder and single-crystal samples of $BaMnF_4$ have failed to show any evidence for the distortion with wave vector, in reciprocal-lattice units, $\vec{q}=(0.4, 0, 0.5)$ recently reported by Scott, Habbal, and Hidaka. The distorted phase which is observed below 247K is described by a wave vector $\vec{q}=(\zeta, 0.5, 0.5)$ with ζ incommensurate. There is a small (~1%) increase in the magnitude of ζ as the temperature is lowered to 100K, and the detailed temperature dependence of ζ is found to be different on heating and on cooling. The low-temperature distortion is characterized by a single wave vector $\vec{q}=(\zeta, 0.5, 0.5)$ rather than by a pair of wave vectors $(\zeta, 0.5, 0.5)$ and $(\zeta, -0.5, 0.5)$. (9 refs.)

107646 Structure of synthetic alkali yttrium silicates. B.V.Merinov, B.A.Maksimov, L.N.Dem'yanets, V.A.Timofeeva, N.V.Belov (Inst. of Crystallography, Acad. of Sci., USSR).

Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.92-4 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.166-9 (Jan.-Feb. 1983). [received: Sept. 1983]

By varying the $Na_2O:Y_2O_3:SiO_2$ ratios and by an appropriate choice of method, a number of alkali silicates have been synthesized with increasing Na_2O/Y_2O_3 ratios (1:1, 3:1, 5:1 (moles)) with various values of Y_2O_3/SiO_2 (1:2, 1:4, 1:6): $NaYSiO_4$, $Na_3YSi_2O_7$, $Na_5YSi_4O_{12}$, $NaYSiO_4.0.25NaF$, and $Na_3YSi_3O_9$. The first three compounds were first synthesized by the hydrothermal method, and the last two by crystallization from solution in a melt. The preparation of a number of silicates with various Na/Y and Y/Si ratios enabled the authors to follow the changes of structure with composition in the Y phases. (12 refs.)

107647 The crystal structure of fedorite. G.V.Sokolova, A.A.Kashaev, V.A.Drits, V.V.Ilyukhin (Geological Inst. Acad. of Sci., USSR).

Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.95-6 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.170-2 (Jan.-Feb. 1983). [received: Sept. 1983]

The parameters of the triclinic unit cell of fedorite are: $a=9.676(2)$; $b=16.706(1)$; $c=13.233(2)$ Å; $\alpha=93.35$; $\beta=114.96$; $\gamma=90.03°$; space group $C\bar{1}$ ($\rho_{exp}=2.43$ g/cm^3); they were measured in a Syntex diffractometer, and permitted the chemical analysis to be transformed to a structural formula. All the calculations in the structural determination were made with the aid of the RENTGEN-75 program. (5 refs.)

107648 Structure of α-GeTe-based solid solutions in the GeTe-InTe system. G.V.Gorne, A.A.Koz'ma, A.N.Melikhova, E.I.Rogacheva (Polytech. Inst., Khar'kov, Ukrainian SSR).

Sov. Phys.-Crystallogr. (USA), vol.28, no.2, p.225-6 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.385 (March-April 1983). [received: Sept. 1983]

The authors have made a detailed X-ray diffraction investigation of the structure of the α-solid solution. On the basis of an analysis of the relative integral intensities of the lines, they have established that addition of InTe or GeTe leads to a decrease in the displacement of the cations from their ideal positions in the NaCl-type structure, and also stimulates the process of filling of tetrahedral gaps by cations. The reduction in unit-cell parameter observed when up to 12 mole % of InTe is added is due to a decrease in the rhombohedral distortion of the lattice with increasing InTe concentration. (3 refs.)

107649 Pentavalent iron stabilized for the first time in sixfold coordination in an oxide. B.Buffat, G.Demazeau, M.Pouchard, P.Hagenmuller (Univ. of Bordeaux, Talence, France).

Silikaty (Czechoslovakia), vol.27, no.3, p.253-6 (1983). In Czech.

It might be expected that iron (V), which probably adopts an isotropic electronic configuration $(t_2{}^3{}_g e_g{}^0)$, could be stabilized in a small site of O_h symmetry. The perovskite structure stable under pressure with octahedral sites occupied by small cations appeared to be suitable for such stabilization. For this reason the authors attempted to prepare the compound La_2LiFeO_6 for which the covalency of the σ (Fe-O) bonds is supported by the absence of antibonding σ^* electrons and by the existence of Li-O bonds with prevailing ionic contribution. The preparation of La_2LiFeO_6 was done in two steps. The starting mixture of nitrates was at first calcinated at 700°C and then annealed under the pressure of oxygen 60 kbar at 900°C. The existence of Fe+V in La_2LiFeO_6, possessing slightly rhomboelectrically distorted perovskite structure ($a_R=5371$ Å, $\alpha=60,66°$), was confirmed by the determination of the oxidation state of iron by chemical analysis, magnetic susceptibility measurement and study of Mossbauer spectra and EPR. (13 refs.)

107650 A new bismuth containing $Bi_{14}B_4O_{31}$ crystal. T.V.Panchenko, V.F.Katkov, V.Kh.Kostyuk, N.A.Truseeva, A.V.Shmal'k.

Ukr. Fiz. Zh. (USSR), vol.28, no.7, p.1091-3 (July 1983). In Russian.

The authors have obtained macroscopically perfect monocrystals in the Bi_2O_3-V_2O_5 system with a formula of $BI_{14}V_4O_{31}$. The crystals possess a monoclinic structure with the following unit cell parameters: $a=19.720$ Å, $b=11.459$ Å, $c=80.160$ Å, $\beta=90.5°$. Structural phase transitions in the temperature interval 373 to 1273K are not observed. The crystals are optically transparent in the wavelengths interval 0.42 to 6 μm, do not have a domain structure and are characterised by large refractive indices: $n_x=2.2641$, $n_y=2.4902$, $n_2=2.4585$. (11 refs.) *V.G.P.*

107651 Refinement of the structure of ikaite, $CaCO_3.6H_2O$. K.-F.Hesse, H.Kuppers (Mineralogisches Inst., Univ. Kiel, Kiel, Germany), E.Suess.
Z. Kristallogr. (Germany), vol.163, no.3-4, p.227-31 (1983).
Ikaite, $CaCO_3.6H_2O$, is monoclinic, *C2/c*, with $a=8.792(2)$, $b=8.310(2)$, $c=11.021(2)$Å, $\beta=110.53(5)°$, $Z=4$. With 2205 independent reflections taken at −25°C of a naturally grown crystal specimen the structure was refined to a weighted $R_w=0.028$. The CO_3 group is planar with C-O distances 1.279(2) and 1.290(1)(2×) Å. The hydrogen bond network is determined. The optical behaviour is explained by structural characteristics. (17 refs.)

107652 X-ray study on polymorphism of ilvaite, $HCaFe_2^{2+}Fe^{3+}O_2[Si_2O_7]$. Y.Takeuchi, N.Haga (Mineralogical Inst., Univ. of Tokyo, Tokyo, Japan), M.Bunno.
Z. Kristallogr. (Germany), vol.163, no.3-4, p.267-83 (1983).
The crystal structure of the monoclinic form of ilvaite has been investigated. A crystal from Tsumo, Japan, was characterized by space group $P2_1/a$, with $a=13.009(1)$ Å, $b=8.8008(3)$ Å, $c=5.8589(2)$ Å, $\beta=90.324(9)°$, whereas a crystal from Techukhe, Siberia, had $P2_1/a$, $a=13.013(3)$ Å, $b=8.8197(6)$ Å, $c=5.8424(5)$ Å, $\beta=90.03(1)°$. In the structure, the octahedra formed by oxygen atoms about Fe(11) and those about Fe(12) are alternately linked together, sharing edges to form a chain of octahedra parallel to *c*. The monoclinic symmetry of ilvaite is characterized by ordering of Fe^{2+} and Fe^{3+} which are distributed over these two Fe sites with a ratio of 1:1. The atomic contents in the Fe(11) site, estimated from mean Fe(11)-O length, are: Tsumo ilvaite 0.85 Fe^{2+} and 0.15 Fe^{3+}, and Techukhe ilvaite 0.53 Fe^{2+} and 0.47 Fe^{3+}. From these atomic occupancies, the order parameter, σ, of Tsumo ilvaite is calculated to be 75%, while that of Techukhe ilvaite 6%. From the two cases of monoclinic ilvaites, a relation between β and σ has been deduced; the result permits predicting $\beta\approx90.45°$ for an ilvaite crystal having $\sigma=100\%$. The orthorhombic form of ilvaite may be defined as a form of ilvaite having $\sigma=0$. (19 refs.)

107653 The structural properties of synthetic Sr-akermanite, $Sr_2MgSi_2O_7$. M.Kimata (Inst. of Geosci., Univ, of Tsukuba, Ibaraki, Japan).
Z. Kristallogr. (Germany), vol.163, no.3-4, p.295-304 (1983).
The crystal structure of $Sr_2MgSi_2O_7$ with tetragonal, $a=7.9957(10)$, $c=5.1521(9)$ Å, $Z=2$, space group $P\bar{4}2_1m$ has been refined to $R=4.3\%$ from three-dimensional single-crystal, X-ray diffraction data by full-matrix least-squares calculations, This compound is completely isomorphous with akermanite, $Ca_2MgSi_2O_7$, and the mg and Si atoms are distributed respectively in the T(1) and T(2) sites of the melilite structure. The tetrahedral Mg-O bond length (1.942 Å) is clearly longer than that in $Ca_2MgSi_2O_7$ (1.915 Å), which exhibits the flexibility of T(1) site in melilite structures. In the system $Ca_2MgSi_2O_7$-$Sr_2MgSi_2O_7$ the tetragonal parameters of the solid solutions are linear functions of molar compositions, which implies that this solid solution is continuous. All of the rare silicates with tetrahedrally coordinated Mg cations contain alkali or alkali-earth cations in their structures and the ratios Mg:Si are below one. (35 refs.)

61.65 SPECIFIC STRUCTURE OF ORGANIC COMPOUNDS

107654 Symmetry in N-H...N bonding, the structure of β-iminoamines and their salts. S.Brownstein, E.J.Gabe, L.Prasad (Div. of Chem., Nat. Res. Council of Canada, Ottawa, Ontario, Canada).
Can. J. Chem. (Canada), vol.61, no.7, p.1410-13 (July 1983).
Crystals of 2-*N*-phenylamino-4-*N*-phenylimino-2-pentene are orthorhombic, $a=8.7283(6)$, $b=8.8369(5)$, $c=18.8798(8)$ Å, $Z=4$, space group $P2_1ab$. It is resolved to $R_F=0.053$ for 684 observed reflections. Crystals of 2-*N*-phenylamino-4-*N*-phenylimino-2-pentene hydrochloride are monoclinic, $a=14.6120(9)$, $b=5.2736(7)$, $c=20.708(1)$ Å, $\beta=102.287(5)°$, $Z=4$, space group $P2_1/c$. The final residual is 0.054 for 1255 reflections. Crystals of 2-*N*-methylamino-4-*N*-methylimino-2-pentene hydrochloride are trigonal, $a=7.1666(7)$, $c=15.3299(8)$ Å, $Z=3$, space group $P3_121$. The final residual is 0.044 for 343 observed reflections. The free base exists, in the solid, as the amino-imino form and not as a symmetrical structure. The N-H bond distances in the six-membered ring of the free base are equal as are the N-H bond distances in the infinite chains of the hydrochloride salts. (16 refs.)

107655 The structure and conformation of cis-2-phenylcyclobutanecarboxylic acid and cis-3-(p-fluorophenyl)cyclobutanecarboxylic acid. G.M.Reisner, J.D.Korp, I.Bernal, R.Fuchs (Dept. of Chem., Univ. of Houston, Houston, TX, USA).
Can. J. Chem. (Canada), vol.61, no.7, p.1422-7 (July 1983).
The structure of *cis*-2-phenylcyclobutanecarboxylic acid (**1**) and *cis*-3-(*p*-fluorophenyl)cyclobutanecarboxylic acid (**2**) have been determined by X-ray diffraction methods. Crystals of **1** are monoclinic, space group *C2/c* with $a=15.420(8)$, $b=11.687(6)$, $c=11.226(5)$ Å, $\beta=112.45(4)°$, and eight molecules in the unit cell. Crystals of **2** are monoclinic, space group $P2_1/n$, $a=8.038(5)$, $b=5.405(4)$, $c=22.69(1)$ Å, and $\beta=97.30(4)°$, with four molecules in the unit cell. In both compounds the cyclobutane ring is puckered, with dihedral angles of 27° and 31°. The bond joining the substituted ring atoms in **1** is significantly longer (1.581(2) Å) than the other three (average 1.535(2) Å), due to crowding of substituents. In **2** both the carboxyl and phenyl substituents are close to the bisecting geometry, whereas in **1** both substituents deviate from this conformation, the carboxyl more than the phenyl. (18 refs.)

107656 Crystal structures of two methylmercury complexes with 1-methylimidazoline-2-thione. A.R.Norris, S.E.Taylor, E.Buncel (Dept. of Chem., Queen's Univ., Kingston, Ontario, Canada), F.Belanger-Gariepy, A.L.Beauchamp.
Can. J. Chem. (Canada), vol.61, no.7, p.1536-41 (July 1983).
$[CH_3Hg(C_4H_6N_2S)]NO_3$ belongs to space group $P\bar{1}$, $a=7.146(2)$, $b=7.783(3)$, $c=10.184(5)$ Å, $\alpha=72.95(3)$, $\beta=71.09(3)$, $\gamma=81.83(2)°$, and $Z=2$. The structure was refined to $R=0.039$ (1850 nonzero reflections). The crystal contains complex cations in which the CH_3Hg^+ ion is bonded to the exocyclic sulfur atom by a Hg-S bond of 2.382(2) Å. The nitrate ions form secondary bonds to mercury and hydrogen bonds to the acidic proton attached to N(3). $[CH_3Hg(C_4H_5N_2S)]$ is monoclinic, space group *Cc*, $a=7.734(1)$, $b=17.125(3)$, $c=6.061(3)$ Å, $\beta=99.66(3)°$, and $Z=4$. Refinement converged to $R=0.039$ (678 nonzero reflections). The crystal consists of individual monomeric molecules in which the CH_3Hg^+ ion forms a Hg-S bond of 2.338(7) Å. The molecular packing is considered as unusual, since Hg forms no intermolecular secondary bonds in the equatorial plane, even though N(3) has an available lone pair. (29 refs.)

107657 The crystal and molecular structures of 1,2,7,9-tetrathia-3,6,8,10-tetra-aza-cyclohept(e)indene, a novel tricyclic carbon-sulphur-nitrogen ring system. P.W.Codding, H.Koenig, R.T.Oakley (Dept. of Chem., Univ. of Calgary, Calgary, Alberta, Canada).
Can. J. Chem. (Canada), vol.61, no.7, p.1562-6 (July 1983).
The crystal and molecular structures of 1,2,7,9-tetrathia-3,6,8,10-tetra-aza-cyclohept(*e*)indene, a novel carbon-sulphur-nitrogen heterocycle based on the phenazulene ring system, are reported. Crystals of the compound are orthorhombic, space group *Pbca*, $a=7.1334(8)$, $b=14.761(2)$, $c=16.677(2)$ Å, $V=1756.0(3)$ Å^3, $Z=8$. The structure was solved by direct methods and refined by full-matrix least-squares procedures to a final $R=0.044$ and $R_w=0.027$. Molecules of the title compound consist of a five-membered ring and a seven-membered C ring fused to a benzene ring. Internal structural parameters and the cell packing pattern suggest a dipolar charge distribution. The molecules are stacked in parallel planes in a head-to-tail fashion; the interplanar separation is 3.39 Å and the angle between the molecular planes and the *a* axis is 18°. (23 refs.)

107658 The crystal and molecular structure of 2,3,12,13-tetrathia[4,4]metacyclophane. K.A.Beveridge, G.W.Bushnell, R.H.Mitchell (Dept. of Chem., Univ. of Victoria, Victoria, BC, Canada).
Can. J. Chem. (Canada), vol.61, no.7, p.1603-7 (July 1983).
Conformations in a variety of cyclophane structures are discussed, as determined by X-ray diffraction in crystals and by ^1H NMR in solution. Established nomenclature is brought forward (syn/anti and synclinal/anticlinal) and used to deal with an intermediate case which has been examined by both techniques. The crystal and molecular structure of $C_{16}H_{16}S_4$ is determined and refined to $R=0.0497$. The crystal is orthorhombic, space group *Pbca*, $a=16.593(2)$, $b=10.018(2)$, $c=19.407(3)$ Å at 25(2)°C, $Z=8$, $D_{calc}=1.386$ g cm^{-3}. The molecular conformation in the crystal is anticlinal with a dihedral angle between the benzene rings of 101°. The benzene rings are displaced laterally by 0.727 Å and the sequence of torsion angles is similar in the two bridging chains. (18 refs.)

107659 Crystalline conformation and structure of lichenan and barley β-glucan. I.Tvaroska, K.Ogawa, Y.Deslandes, R.H.Marchessault (Dept. of Chem., Univ. de Montreal, Montreal, Quebec, Canada).
Can. J. Chem. (Canada), vol.61, no.7, p.1608-16 (July 1983).
An investigation based on X-ray fiber diffraction and conformational analysis methods has provided a proposed chain conformation and crystalline structure for lichenan, a poly $\beta(1\rightarrow3)$ cellotriose. The analysis of the fiber diagram of the hydrated form of lichenan led to a trigonal unit cell of dimension $a=b=9.92$ Å and *c* (fiber axis)=42.03 Å, with cellotriose as the asymmetric unit and six cellotriose residues per unit cell. A unit cell of the dry form is also trigonal with $a=b=9.36$ Å and $c=42.03$ Å. A right-handed threefold helix made up of three cellotriose residues was derived. A virtual bond approach was also used to arrive at the proposed conformation which is stabilized by intramolecular hydrogen bonds between all carbohydrate units. The refinement of geometrical and packing parameters produced results consistent with an antiparallel arrangement of the two chains corresponding to a space group symmetry of $P3_1$. (27 refs.)

107660 Alkylammonium hexachlorostannates(IV), $(R_nNH_{4-n})_2SnCl_6$: crystal structure, infrared spectrum and hydrogen bonding. O.Knop, T.S.Cameron, M.A.James (Dept. of Chem., Dalhousie Univ., Halifax, NS, Canada), M.Falk.
Can. J. Chem. (Canada), vol.61, no.7, p.1620-46 (July 1983).
The authors have determined the room-temperature crystal structures of $(Me_2NH_2)_2SnCl_6$ and $(Me_3NH)_2SnCl_6$ (variants of the antifluorite structure); $(EtNH_3)_2SnCl_6$ and $(n\text{-}PrNH_3)_2SnCl_6$ (anti-CdI_2 type, with orientational disorder in the Et compound); and $(n\text{-}Pr_3NH)_2SnCl_6$. They have also studied the infrared spectra in the regions of the NH and ND stretching fundamentals between 10 and 293K, of these five compounds and of $(MeNH_3)_2SnCl_6$, $(Me_3NH)_2SnBr_6$, $(Et_2NH_2)_2SnCl_6$, $(n\text{-}Bu_3NH)_2SnCl_6$ and, in less detail, the mixed-anion salt $(n\text{-}Pr_2NH_2)_3(SnCl_6)Cl$. The specific results for the ten compounds studied are discussed in detail. The discussion also includes the limits of usefulness of the isotopic dilution technique; symmetry aspects of the

cation-anion packing in alkylammonium hexahalometallates(IV); symmetries of the arrangements of the $SnCl_6$ octahedra; the geometry of hydrogen bonding in $(R_nNH_{4-n})_2SnCl_6$; and the possibility of detection of the presence of hydrogen bonding from molecular volume trends. (62 refs.)

107661 X-ray diffuse scattering in Wolffram's red salt. S.Iida, T.Iwazumi, H.Terauchi (School of Sci., Kwansei-Gakuin Univ., Hyogo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2769-71 (Aug. 1983).
X-ray diffuse scattering passing through $(00\ L+1/2)$ and extended perpendicularly to the c*-direction is observed in the ground state of the Wolffram's red salt at room temperature. The chain structure $\text{-Pt}^{4+}\text{-Cl-Pt}^{2+}\text{-Cl-}$ is confirmed, however, it is not long range. The short range correlation shows the one-dimensional character. (6 refs.)

107662 Structural analysis of β-form poly(p-xylylene) starting from a high-resolution image. S.Isoda, M.Tsuji, M.Ohara, A.Kawaguchi, K.Katayama (Inst. for Chem. Res., Kyoto Univ., Kyoto, Japan).
Polymer (GB), vol.24, no.9, p.1155-61 (Sept. 1983).
The crystal structure of β-form poly(p-xylylene) is analysed starting from a high-resolution image of a single crystal of this polymer. The high-resolution image corresponding to the projection of molecules onto the *ab*-plane along the chain axis shows clearly the mutual position of each molecule in a unit cell. The molecules are aligned wavily in the direction along the *a*-axis and the rough positions of their centres in a unit cell can be determined from the image. The refinement of the structure is carried out by the usual least-squares method using the intensities of electron and X-ray diffractions. The space group of the β-form is trigonal, P3, and the lattice dimensions are $a=2.052$ nm, $c=0.655$ nm and $\gamma=120°$. The unit cell contains 16 molecules and one of them is considered to occupy statistically one of three equivalent orientations so as to satisfy the P3 symmetry. (10 refs.)

107663 Determination of the spin-Peierls distortion in N-methyl-N-ethyl-morpholinium ditetracyanoquinodimethanide [MEM(TCNQ)$_2$]: neutron diffraction study at 6K. R.J.J.Visser, S.Oostra (Labs. of Chem. Phys., Univ. of Groningen, Groningen, Netherlands), C.Vettier, J.Voiron.
Phys. Rev. B (USA), vol.28, no.4, p.2074-7 (15 Aug. 1983).
The authors have carried out a crystallographic study of the spin-Peierls distorted phase ($T_c=17.4$K) of N-methyl-N-ethyl-morpholinium ditetracyanoquinodimethanide [MEM(TCNQ)$_2$]. Neutron-diffraction data were collected at 6K from a deuterated sample. At the transition the unit cell axis along the dimerized TCNQ stack is doubled, hence giving rise to tetramers. Refinement of rigid molecules converged on $R=0.162$ for 340 super-reflections. The structural change consists of a transverse shift $\Delta\vec{v}=0.17\vec{L}+0.10\vec{M}$ of every second dimer in the stack. Calculations of transfer integrals confirmed the significance of the distortion. (17 refs.)

107664 Improving the resolution of electron density maps of proteins by refining the model structure. I. Numerical experiments. V.Yu.Lunin, A.G.Urzhumtsev (Sci.-Res. Computing Center, Acad. of Sci., USSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.2, p.181-4 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.310-15 (March-April 1983). [received: Sept. 1983]
The authors describe numerical experiments to extend and refine the set of phases determined in X-ray structural investigations of proteins. The set of phases is improved by constructing and refining a trial model of the structure. (3 refs.)

107665 The structure of perdeuteronaphthalene $C_{10}D_8$ at 12K by neutron diffraction. I.Natkaniec, A.V.Belushkin (Joint Inst. of Nuclear Res., Dubna, USSR), W.Dyck, H.Fuess, C.M.E.Zeyen.
Z. Kristallogr. (Germany), vol.163, no.3-4, p.285-93 (1983).
The molecular and crystal structure of perdeuteronaphthalene was refined from neutron diffraction data collected at 12K on an automatic four-circle diffractometer. The monoclinic space group $P2_1/a$ remains unchanged, lattice constants at 12K are: $a=8.096(7)$, $b=5.941(5)$, $c=8.648(7)$ Å, $\beta=124.63(5)°$, $Z=2$, $\mu(\lambda=1.26\ Å)=0.095\ cm^{-1}$. 907 symmetry-independent reflections up to $\sin\theta/\lambda=0.72\ Å^{-1}$ refined to $R_w(F)=0.044$. The $C_{10}D_8$ molecule is planar with a maximum distance of atoms from a least-squares plane of 0.008 Å. Mean distances are $C-C=1.371-1.432$ Å, $C-D=1.091-1.095$ Å. The refined structure is compared to a structure calculated from atom pair potentials. (18 refs.)

61.70 DEFECTS IN CRYSTALS

(see also 61.80 Radiation damage, 62. Mechanical and acoustic properties, 71.55 Impurity and defect levels, 76.30M EPR of colour centres and other defects, 78.50 Impurity and defect absorption in solids, 81.40 Treatment of materials)

107666 Observation of defects in an InSb single crystal by neutron topography. B.Chalupa, R.Michalec, B.Haskova, J.Vavra (Nuclear Phys. Inst., Czechoslovak Acad. of Sci., Rez, Czechoslovakia).
Cryst. Res. & Technol. (Germany), vol.18, no.7, p.K65-7 (1983).
Neutron diffraction topography (NDT) is a promising method for nondestructive investigations of nearly perfect crystals. A small neutron absorption in most materials is of interest when working with thick samples. However, it is possible to observe defects in samples having absorption coefficient of the order of $10^2\ m^{-1}$. Such a situation is met in the case of an InSb crystal. Its absorption coefficient is about $2\times10^2\ m^{-1}$ for neutron wavelength of 0.16 nm. In this case a suitable pattern may be obtained for a sufficiently long exposure time. As compared to some other materials investigated (e.g. Fe, Si, etc.) a strong radioactivity is induced in this sample. (4 refs.)

107667 New morphological types of CuSi precipitates in silicon and their electrical effects. R.Gleichmann, H.Blumtritt, J.Heydenreich (Inst. fur Festkorperphys. & Elektronenmikroskopie, Akad. der Wissenschaften, Halle (Saale),, Germany).
Phys. Status Solidi a (Germany), vol.78, no.2, p.527-38 (16 Aug. 1983).
By combined SEM/EBIC and TEM observations the defect structure of long-time processed copper-contaminated floating zone silicon is investigated. Besides the dominant compact precipitates of CuSi, different types of extended planar precipitates are found, which occur in form of large defect complexes with extremely low density. The observations indicate the different defect types to represent stages of a common transformation process of the metastable CuSi phase. The analysis of the EBIC contrasts shows all defects to be electrically active but with strong qualitative and quantitative differences. (11 refs.)

61.70B Interstitials and vacancies

(exc. colour centres)

107668 Kinetics of interstitial supersaturation during oxidation of silicon. S.M.Hu (IBM General Technol. Div., East Fishkill Facility, Hopewell Junction, NY, USA).
Appl. Phys. Lett. (USA), vol.43, no.5, p.449-51 (1 Sept. 1983).
The kinetics of the supersaturation of self-interstitials during the thermal oxidation of silicon is reexamined by considering a finite diffusivity of these interstitials. The rate of interstitial generation is assumed to be proportional to the rate of oxidation, and the rate of surface annihilation is assumed to be a first order reaction. The result from an analytical solution shows that within a reasonable oxidation time span, a suitable power-law kinetics is obtained, with an exponent that falls within the range of most of the reported experimental values. (33 refs.)

107669 Vacancy formation enthalpies in $A^IB^{III}C_2^{VI}$ chalcopyrite semiconductors. H.Neumann (Sektion Phys., Karl-Marx-Univ., Leipzig, Germany).
Cryst. Res. & Technol. (Germany), vol.18, no.7, p.901-6 (1983).
Formation enthalpies ΔH_v of single vacancies in all $A^IB^{III}C_2^{VI}$ chalcopyrite structure compounds are estimated using the macroscopic cavity model. A comparison with atomic sublimation enthalpies ΔH_{sub} of the B^{III} and C^{VI} atoms derived from existing partial vapour pressure data shows that within the accuracy of this data and the theoretical calculations the relation $\Delta H_v \lesssim \Delta H_{sub}$ is fulfilled as expected from general considerations. (21 refs.)

107670 Interaction of an interstitial impurity with a divacancy. M.P.Shetbaeva, V.V.Kirsanov, N.S.Okhrimenko (Inst. of Nuclear Phys., Acad. of Sci., Alma-Ata, Kazakh SSR).
Fiz. Met. & Metalloved. (USSR), vol.56, no.1, p.14-17 (July 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
The method of dynamic modeling on a computer is used to study the reactions of interstitial helium with divacancies in an α-Fe crystal. The analysis is applied to a microcrystallite (micrograin) consisting of 855 elastically coupled iron atoms. Consideration is given to reactions between interstitial helium and three different divacancies with components at the lattice sites in the positions of the first-, second-, and third-nearest neighbours. The binding energies of these divacancies are found to be 0.21, 0.47, and 0.10 eV, respectively. The zone of spontaneous interaction of an (He+2 V) complex is found for each divacancy. The most stable divacancy of the ⟨100⟩ type corresponds to a zone of 63 unstable positions of a helium atom. In the case of the ⟨111⟩ and ⟨110⟩ divacancies these zones consist of 69 and 71 unstable helium positions, respectively. Three types of mechanism of the interaction of helium with a divacancy are established. (5 refs.) *A.T.*

107671 Dynamics of absorption of host interstitial atoms by vacancy pores. S.I.Golubov, A.M.Minashin.
Fiz. Met. & Metalloved. (USSR), vol.56, no.1, p.47-52 (July 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
An analysis is made of the dynamics of the process of absorption of host interstitial atoms with the [100] dumb-bell configuration in a metal with a face-centred cubic lattice by pores which are bounded by (100) and (111) planes. It is shown that the capture of interstitial atoms occurs by a chain of substitutions along the [110] close-packed direction. This increases the efficiency of the capture of interstitial atoms by pores. (9 refs.) *A.T.*

107672 Volume changes and dipole tensors for point defects in crystals. A.M.Stoneham (Theoretical Phys. Div., AERE, Harwell, England).
J. Phys. C (GB), vol.16, no.25, p.L925-8 (10 Sept. 1983).
Results for the volume change and dipole tensors for point defects are derived using a generalisation of the Betti reciprocity theorem. These results incorporate the correction terms derived by Flynn (1971) by Lidiard (1981) and by Gillan (1983) in a simpler way, and allow some more general results to be obtained straightforwardly. (10 refs.)

107673 Interstitial type defects in ion implanted silicon. N.I.Berezhnov, V.F.Stelmakh, A.R.Chelyadinskii (Dept. of Phys., Belorussian State Univ., Minsk, Belorussian SSR).
Phys. Status Solidi a (Germany), vol.78, no.2, p.K121-5 (16 Aug. 1983).
To determine the temperature intervals of interstitial type defect annealing and to estimate their concentration, ion implanted Si crystals heavily doped during growth with boron ($\rho_0=0.005\ \Omega$ cm) were investigated by the X-ray diffraction method by measuring the lattice period. The results indicate that the concentrations of the stable interstitial type defects generated by ion implantation are comparable with the concentration of vacancy type defects. The preponderated interstitial type complexes are annealed at ≈140 and $\approx500°C$ when Si crystals were implanted with boron ions (implantation with light mass ions). The annealing stages are shifted up to ≈180 and $\approx560°C$ in case of the medium mass ion implantation (phosphorus ions). (14 refs.)

107674 Total energy of isolated point defects in solids. G.A.Baraff, M.Schluter (Bell Labs., Murray Hill, NJ, USA).
Phys. Rev. B (USA), vol.28, no.4, p.2296-8 (15 Aug. 1983).
Total-configurational-energy calculations have already been very successfully carried out for periodic structures and for isolated molecules, allowing one to study, e.g. crystal structures, reconstructions, and vibrational frequencies. The authors describe for the first time a method for calculating the total energy of isolated, charged, point defects in an infinite crystal. It uses the self-consistent

Green's function technique. They demonstrate its quantitative utility by applying it to two defects in GaP. (19 refs.)

107675 Possibility of antistructural defects in undoped cadmium telluride. V.N.Martynov, S.P.Kobeleva (Inst. of Steel & Alloys, Moscow, USSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.2, p.232-3 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.394 (March-April 1983). [received: Sept. 1983]
The region of homogeneity in CdTe is calculated on the assumption that the main intrinsic point defects in the material are Frenkel pairs in both sublattices. The deviation from stoichiometry δ is $\sim 10^{18}$ cm^{-3}. The neutral centers determining the rather large values of δ at the boundary of the region of homogeneity of CdTe on the side with excess Te are antistructural defects Te_{Cd}. (4 refs.)

107676 Studies of point defects by positrons and positive muons. M.Doyama (Dept. of Metall. & Materials Sci., Univ. of Tokyo, Tokyo, Japan).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.3-10
Positron annihilation and positive muon spin relaxation techniques can be applied to the study of point defects. By positron annihilation the formation energies of a vacancy have been measured in many pure metals and alloys. Positron annihilation is quite sensitive to small vacancy clusters which cannot be observed by electron microscopy. Positive muons can also be used to study vacancy type defects. Quenched-in vacancies in pure aluminum and aluminum dilute alloys have been quantitatively studied. These techniques can be used as one of the nondestructive testing techniques. (24 refs.)

107677 Observation of monovacancies in iron by/ the μSR technique. A.Moslang, H.Graf, E.Recknagel, A.Weidinger, T.Wichert, R.I.Grynszpan (Faultat fur Phys., Univ. of Konstanz, Konstanz, Germany).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.11-14
A muon-spin-rotation (μSR) experiment was performed on electron irradiated iron. A new frequency (30 MHz) was found which is distinctly different from the 50 MHz line observed in unirradiated iron. Symmetry considerations indicate that the new frequency is due to muons trapped at monovacancies. The complete disappearance of this line above stage III is interpreted as evidence for vacancy migration at 220K in Fe. (5 refs.)

107678 PAC study of point defects in metals. T.Wichert (Fakultat fur Phys., Univ. Konstanz, Konstanz, Germany).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.19-26
Recent advances in the study of point defects and small defect clusters by the perturbed angular correlation technique (PAC) are discussed. The formation of impurity defect complexes becomes visible via a defect specific electric field gradient, which allows one to recognize the trapped defect in further experiments and to deduce information about the microscopic structure of the complex. Experimental data on interstitials, vacancies and their agglomerates as obtained in isochronal annealing experiments and by defect-antidefect reactions are presented. (35 refs.)

107679 Nuclear magnetic resonance study of point defects in aluminium and copper. C.Minier, R.Minier (Dept. de Recherche, Centre d'Etudes Nucleaires de Grenoble, Grenoble, France).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.27-32
The principles of nuclear magnetic resonance for the determination of electrical field gradients on successive nuclei shells around a point defect are given. Results in copper and aluminium containing specific impurities or monovacancies are discussed. Measurements in electron irradiated copper shows unambiguously that monovacancies migrate during stage III. (12 refs.)

107680 X-ray studies of interstitials in metals. H.Peisl (Sektion Phys., Ludwig-Maximilians Univ., Munchen, Germany).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.41-6
Interstitial atoms in a crystal lattice cause a distortion field, which can be studied by X-ray or neutron scattering methods. The Bragg peaks are shifted due to an average lattice parameter change, their intensities are attenuated by a static Debye-Waller factor and a diffuse intensity distribution close to the Bragg peaks (Huang scattering) and between the Bragg peaks (Zwischenreflexscattering) occurs. In an X-ray investigation of niobium with interstitial hydrogen all effects have been observed consistently. The defect volume, the long-ranged distortion field, the defect site and structure and the displacements of the nearest neighbours are determined. (9 refs.)

107681 Self-interstitial-atoms and their agglomerates in HCP metals. P.Ehrhart (Inst. fur Festkorperforshung, KFA Julich, Julich, Germany), B.Schonfeld.
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.47-52
After electron irradiation at 4K the defect structures in HCP metals have been investigated by measurement of the diffuse scattering of X-rays (Huang Diffuse Scattering), the change of the lattice parameter and the change of the electrical resistivity. Measurements were performed on metals with a large c/a ratio (Cd, Zn) and with nearly an ideal c/a ratio (Co, Mg, Zr). Large differences were found for the properties of self interstitial atoms (SIA) and their agglomerates in different HCP metals: the relaxation volume of the SIA varies from 0.6 atomic volumes for Zr to 3.5 atomic volumes for Zn; the anisotropies of the long range displacement fields are very different (even different signs !); interstitial mobility is below the irradiation temperature of 4.5K for Cd and Mg. (13 refs.)

107682 Nature of point defects and their interactions revealed by electron-microscope observation of their clusters. M.Kiritani (Dept.of Material Phys., Osaka Univ., Osaka, Japan).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.59-66
Type of defects formed by the aggregation of point defects is discussed. The interaction of interstitials with dislocations is viewed from the growth of dislocation loops. Annihilations process of defect clusters is also discussed. Primary damage process by high energy electrons is analyzed from the localized formation of vacancy clusters. Free migration of vacancies, especially in α-iron, is discussed from interstitial loop growth during high temperature electron irradiation, and the aging experiment of low temperature irradiation induced interstitial clusters indicates the vacancy motion at 220K. Irradiation induced segregation of solute elements in dilute alloys is detected by impurity sensitive nucleation of point clusters. (16 refs.)

107683 Ultrasonic studies of dipolar point defects. A.V.Granato (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.67-72
Dipolar point defects interaction strongly with ultrasonic shear stress. Measurements of ultrasonic attenuation and velocity as a function of polarization, frequency, temperature and defect density display both dielastic and parelastic behaviour. Effects are readily detected for defect densities in the ppm range, where defect interaction effects can be avoided. Measurements have been made in irradiated Al and Cu alloys, and in Nb with H and D. In general, multiple peaks are found. Evidence for the mixed dumbbell configuration is obtained for Al-Zn and Al-Ag. The ultrasonic technique is particularly useful for low temperature peaks showing quantum effects which would not be detectible at lower frequencies. For example, it is found that the mixed dumbbell tunnels between equivalent configuration in Al-Zn, while for Nb/H, the relaxation occurs in an excited state with an enormous isotope effect in the relaxation time. By using specimens containing both weak and strong impurity trapping centers, it can be determined whether the weakly bound complex diffuses or dissociates. (12 refs.)

107684 Unsolved problems concerning point defects. J.S.Koehler (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.143-4
The unsolved problems are as follows: the structure and properties of small vacancy clusters; the structure and properties of self interstitials in body centered and in hexagonal metals; interstitial impurity interactions. (12 refs.)

107685 Computer studies on self-interstitials in magnesium. M.Imafuku, R.Yamamoto, M.Doyama (Dept. of Metall. & Materials Sci., Univ. of Tokyo, Tokyo, Japan).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.145-8
The configurations of self-interstitial atoms (SIA) in magnesium were studied by using the Lennard-Jones (LJ) potential. It was found that a split interstitial along the a-axis and an octahedral interstitial have the smallest formation energies. The dynamic properties of these interstitials were also investigated by the recursion method. (7 refs.)

107686 X-ray diffraction studies on the interstitials in high-purity iron. N.Tsukuda, K.Kitajima (Res. Inst. for Appl. Mech., Kyushu Univ., Fukuoka, Japan).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.171-3
X-ray diffraction studies on interstitials in high-purity iron were performed. Examinations of single crystals were carried out by topography and by double-crystal diffraction techniques. Lattice parameter change $\Delta a/a$ and diffuse scattering intensity (Huang scattering) I_H were measured for electron-irradiated iron at 77K. The volume relaxation of the interstitials $\Delta V/V_c$ was estimated at 1.5. The intensity distributions of I_H against q in double-logarithmic scale show clustering of the interstitials. (12 refs.)

107687 Experimental determinations of the concentration and the mobility of interstitials in pure ice crystals. K.Goto, T.Hondoh, A.Higashi (Dept. of Appl. Phys., Hokkaido Univ., Sapporo, Japan).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.174-6
Improved X-ray diffraction topographic method to determine the equilibrium concentration of interstitials in ice is described. The formation energy and the formation entropy of self-interstitials in ice were determined to be 0.40 eV and 4.2×10^{-4} eV/K, respectively from exact values of the concentration thus determined at various temperatures above -30°C. Auxiliary results of diffusion coefficient of the interstitials and of the calculation of criteria for the formation of secondary defects in ice crystals by cooling are presented. (3 refs.)

107688 Atomic defects in BCC transition metals. H.Schultz (Inst. fur Phys., Max-Planck-Inst. fur Metall., Stuttgart, Germany).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.183-90
New experimental results, obtained by resistivity investigations on BCC transition metals (Nb, Ta, Mo, W, Fe) following low-temperature electron irradiation or quenching in superfluid helium are summarized. Defect properties have characteristic trends related to the position of the element in the periodic table. The low temperature recovery reactions show deviations from the Corbett-Smith-Walker scheme of FCC metals. It is discussed what kind of additional assumptions are necessary to incorporate the new observations into this model. (61 refs.)

107689 Mean-square displacement of an interstitial impurity atom. M.Kaneko, Y.H.Ohashi, M.Fukuchi (Faculty of Sci. & Technol., Keio Univ., Kanagawa, Japan), K.Ohashi.
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.319-21
The dynamics of an interstitial H atom in a FCC Al metal have been investigated by the pseudopotential method and Green function technique. The interionic force constant between a pair of Al ions and the H-Al atom force constant are determined by means of the pseudopotential. The coupling between Al and H is considerably weak, so that one may expect the low frequency resonance which leads to especially large thermal displacement of an interstitial H atom. (11 refs.)

107690 Study of self-interstitial-atom solute-atom-complexes by mechanical relaxation. K.-H.Robrock (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.353-9
The reaction of migrating self-interstitial-atoms with solute-atoms in solid solution leads to the formation of a so-called self-interstitial-atom solute-atom (SIA-SA)-complexes. The complexes may consist either of solute-atoms in interstitial sites or self-interstitial-atoms bound to substitutional solute-atoms. Internal friction experiments have been performed on some dilute Al, Cu and Ni alloys after electron irradiation and subsequent thermal annealing treatments. Internal friction peaks are observed in each of the alloys, which do not exist in the pure solvent material and which appear after self-interstitial atom

migration in stage I. They are therefore attributed to the local reorientation of SIA-SA-complexes. The peak-properties are critically discussed in terms of recent defect-models with particular emphasis on atomic jump modes, configurations, binding- and migration energies of SIA-SA-complexes. (15 refs.)

107691 Channeling studies of defect trapping configurations in aluminum. M.L.Swanson, L.M.Howe (AECL Res. Co., Chalk River Nuclear Labs., Chalk River, Ontario, Canada).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.364-7
In dilute Al alloys, channeling measurements were made as a function of He^+ ion fluence in order to study both self-interstitial and vacancy trapping configurations. It was found that (a) Al self-interstitials were trapped by Ag or Mn atoms, creating simple ⟨100⟩ mixed dumbbells at low fluences; in the case of Ag solute atoms, this configuration was altered at higher fluences where multiple trapping occurred; (b) Al self-interstitials which were trapped by In or Sn atoms did not create mixed dumbbells; (c) vacancies were trapped by In or Sn atoms to form trivacancy-solute, tetravacancy-solute and hexavacancy-solute atom complexes, in which the solute atoms were located at interstitial sites $(1/3, 1/6, 1/6)a_0$, $(1/4, 1/4, 1/4)a_0$ and $(1/2, 1/2, 1/2)a_0$, respectively. (18 refs.)

107692 Vacancies in carbon-doped iron. P.Hautojarvi, J.Johansson (Lab. of Phys., Helsinki Univ. of Technol., Espoo, Finland), P.Moser, L.Pollanen, A.Vehanen.
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.504-7
Electron and neutron irradiated carbon-doped iron is studied by positron lifetime measurements. The results show that stable carbon-vacancy pairs are formed at stage III when migrating vacancies are captured by C atoms. The pairs dissociate at 480K causing a second release of free vacancies. Correlated vacancy migration within collision cascades is shown to take place in neutron-irradiated specimens. (10 refs.)

107693 Two types of F centres in alkaline earth fluoro-halides. I. Superhyperfine interactions and electronic structure. R.U.Bauer, J.R.Niklas, J.-M.Spaeth (Fachbereich Phys., Univ.-GH Paderborn, Paderborn, Germany).
Phys. Status Solidi b (Germany), vol.118, no.2, p.557-66 (1 Aug. 1983).
In the alkaline earth fluoro-halides BaFCl, SrFCl, and SrGBr, two types of F centres with different symmetry are produced, were the electron occupies either an F^- vacancy ($F(F^-)$ centres) or a Cl^- or Br^- vacancy ($F(Cl^-$, $Br^-)$ centres), respectively. Using electron nuclear double resonance the superhyperfine and quadrupole interactions with up to nine shells of neighbour nuclei are determined. The spin density distribution is rather anisotropic. For $F(Cl^-)$ centres it can be explained with an 1s-type centre wave function if the mutual overlap of the lattice ions is taken into account. For the $F(F^-)$ centres as small admixture of a 2p- or a 3d-type orbital to the 1 s function is required. (17 refs.)

107695 The defect structure of crystals grown in large scale industrial crystallizers: Case of ammonium sulphate. W.J.P.van Enckevort, H.J.Boeshaar (Catholic Univ., Nijmegen, Netherlands).
Cryst. Res. & Technol. (Germany), vol.18, no.7, p.K79-83 (1983).
Despite the fact that in industry enormous amounts of crystalline materials are produced, only little work has been done on the investigation of the defect structure of crystals grown in industrial mass crystallisers. Ammonium sulphate crystals collected from a production line of a commercial plant are investigated by the Lang method. The defect configuration of these crystals observed by this X-ray topographic technique is compared with the dislocation structure of high quality, laboratory grown $(NH_4)_2SO_4$ crystals. (10 refs.)

107696 On the theory of X-ray and thermal neutron scattering in strongly distorted crystals containing dislocation loops. R.I.Barabash, M.A.Krivoglaz (Polytech. Inst. & Inst. of Phys. of Metals, Acad. of Sci., Kiev, Ukrainian SSR).
Phys. Met. (GB). Translation of: Metallofizika, Kiev (USSR), vol.4, no.3, p.417-28 (1982). [received: Aug. 1983]
Discusses X-ray and neutron scattering in crystals with a high density of dislocation loops. The width and shift of regular reflection maxima have been investigated. Numerical calculations have been made for prismatic dislocation loops and for glide loops in elastically isotropic crystals. A single system of loops of a given orientation and arbitrarily oriented loops as well as the dependence of quasi-line broadening on the diffraction vector orientation have been studied. (8 refs.)

107697 Dislocations in $Pb_{1-y}Sn_ySe$. A.P.Petukhov.
Inorg. Mater. (USA), vol.18, no.11, p.1543-5 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1798-801 (Nov. 1982).
It has been shown that the overall magnitudes of the damaged layer, and of the region with elevated dislocation density due to electrospark cutting and polishing with ASM-1.0 diamond paste on $Pb_{1-y}Sn_ySe$ single crystals, may be taken as correspondingly 100-300 and 100-200 μm. Annealing of a mechanically polished wafer reduces the dislocation density in the region of elevated density. It has been found that $Pb_{1-y}Sn_ySe$ films grown by liquid phase epitaxy on PbSe substrates usually have a surface dislocation density of 10^4-10^5 cm^{-2}. (3 refs.)

107698 Effect of growth conditions on formation of microdefects in dislocation-free silicon crystals. V.P.Grishin, L.P.Katerushina, L.V.Lainer, O.A.Remizov (State Sci. Res. & Design Inst. of the Rare-Earth-Metal Industry, USSR).
Inorg. Mater. (USA), vol.18, no.9, p.1222-4 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1437-9 (Sept. 1982). [received: Sept. 1983]
The authors have investigated the nature of the microdefect distribution in dislocation-free single crystals of silicon grown by the Czochralski method and by crucible-free zone melting. It has been shown that in crystals obtained by the Czochralski method, a large variety of microdefect distribution patterns is observed. The effect of the atmosphere and the rate of growth on the density and distribution of the microdefects has been determined. A mechanism by which microdefects are formed during the growth of dislocation-free single crystals of silicon has been proposed. (7 refs.)

107699 Cross-slip on the first order pyramidal plane ($10\bar{1}1$) of a-type dislocations ($1\bar{2}10$) in the plastic deformation of α-titanium single crystals. S.Naka, A.Lasalmonie (Office Nat. d'Etudes et de Recherches Aerospatiales, Chatillon-sous-Bagneux, France).
J. Mater. Sci. (GB), vol.18, no.9, p.2613-17 (Sept. 1983).
The nature of the cross-slip plane was determined by electron microscopy observations of α-titanium single crystal specimens, oriented for single prismatic slip ($10\bar{1}0$) [$1\bar{2}10$]. The occurrence of cross slip on the first order pyramidal plane ($10\bar{1}1$) was proved for a-type dislocations [$1\bar{2}10$]. Furthermore, two types of dislocation configuration due to the double cross-slip were observed: edge dislocation dipoles and loops elongated along the Burger's vector. (8 refs.)

107700 A transmission electron microscopy study of hexagonal ice. A.H.Falls, S.T.Wellinghoff (Dept. of Chem. Engng. & Materials Sci., Univ. of Minnesota, Minneapolis, MN, USA), Y.Talmon, E.L.Thomas.
J. Mater. Sci. (GB), vol.18, no.9, p.2752-64 (Sept. 1983).
The morphologies of fast-frozen, thin-film samples of pure and dilute solutions of salts and surfactants in hexagonal ice are investigated with transmission electron microscopy. The cold-stage microscopy technique is described briefly and limitations imposed by the equipment and the sample itself are discussed. Ice grains, grain boundaries, dislocations, and stacking faults are imaged before radiolysis from the electron beam can alter their structures. The technique shows that screw dislocations in the ice basal plane are common, in accord with observations from X-ray topography and etch-replication microscopy. It also makes visible nonbasal dislocations in hexagonal ice, including dislocation in first prismatic planes, nonprismatic dislocation loops, and stacking faults on first pyramidal planes; heretofore, these defects have not been confirmed experimentally. Implications of the work for cold-stage microscopy of microstructured fluids are mentioned. (47 refs.)

107701 Dislocation configurations induced by cyclic deformation in silicon crystals. Y.Nishino (Dept. of Crystalline Materials Sci., Nagoya Univ., Nagoya, Japan), T.Imura.
Phys. Status Solidi a (Germany), vol.78, no.2, p.655-63 (16 Aug. 1983).
Silicon crystals are stressed cyclically in tension and in compression at the stress level of about one-seventh of the upper yield stress at 1073K. Electron microscope observations indicate that edge dislocation bundles and dipoles are common to both cyclic and tensile deformation in the early stages. In cyclic deformation, the majority of dislocations assume the dipole configuration even in the initiation of cycling, and very few primary screw dislocations are found. In the manner as in f.c.c. metals, the dislocation bundles contribute to rapid hardening by providing effective barriers to continued dislocation motion. The present results suggest that the fatigue hardening is possible to take place during cyclic deformation in the elastic region. (18 refs.)

107702 Nucleation and growth process of dislocation loops in electron-irradiated β-Nb-3.1 wt.% Zr alloy. K.Nakai, C.Kinoshita, Y.Muroo, S.Kitajima (Dept. of Nuclear Engng., Kyushu Univ., Fukuoka, Japan).
Philos. Mag. A (GB), vol.48, no.2, p.215-30 (Aug. 1983).
In order to understand the kinetic behaviour of point defects in β-Nb-3.1 wt.% Zr containing small amounts of impurities, the nucleation and growth process of dislocation loops has been examined during electron irradiation in a high-voltage electron microscope. Small dislocation loops of interstitial character are formed during irradiation at temperatures from 300 to 675K. The density of loops saturates at the beginning of irradiation, and loops grow in proportion to the cube root of irradiation time. The temperature dependence of the saturated loop density under a fixed electron flux consists of five stages. These results, together with the dependence of loop density on electron flux, are analysed in terms of the effect of impurities on the nucleation process of loops and the mobility of point defects. Two kinds of impurity, probably oxygen and nitrogen, act as nucleation sites of loops. The binding energies between a Nb interstitial and each of these impurities are estimated to be $(1.1\pm0.1)\times10^{-19}$ J and $(7.2\pm0.8)\times10^{-20}$ J, respectively, and the migration energy of free Nb interstitials is estimated to be $(3.4\pm0.5)\times10^{-20}$ J. (22 refs.)

107703 The isolated partial and dissociated total dislocations in deformed ZnS crystals. A.V.Zaretskii, Yu.A.Osipyan, V.F.Petrenko, G.K.Strukova, I.I.Khodos (Inst. of Solid State Phys., Acad. of Sci., Moscow, USSR).
Philos. Mag. A (GB), vol.48, no.2, p.279-85 (Aug. 1983).
The dislocation structure of plastically deformed ZnS crystals has been studied using transmission electron microscopy. It is shown that both total and partial dislocations are simultaneously available in the crystal. The total dislocations are dissociated into Shockley partials. (12 refs.)

107704 Disordering and enhanced damping in Cu_3Au. K.Miura, T.Yokoyama (Dept. of Mech. Engng., Yokohama Nat. Univ., Yokohama, Japan).
Philos. Mag. A (GB), vol.48, no.2, p.L1-4 (Aug. 1983).
Amplitude-independent dislocation damping in Cu_3Au is measured during disordering. When disordering takes place homogeneously at higher temperatures an enhanced damping is observed. When it occurs at lower temperatures, however, no enhancement is observed. Based on a mechanism of enhanced damping by dissociation of a superdislocation, it is suggested that the disordering in Cu_3Au immediately above the order-disorder transformation temperature may be characterized, to a certain extent, by an inhomogeneous process. (7 refs.)

107705 Direct observations of the effect of hydrogen on the behavior of dislocations in iron. T.Tabata, H.K.Birnbaum (Dept. of Metall. & Mining Engng., Univ. of Illinois, Urbana, IL, USA).
Scr. Metall. (USA), vol.17, no.7, p.947-50 (July 1983).
Investigates the effects of hydrogen on the behavior of dislocations in iron of various purities by using an in situ deformation technique in the environmental cell of a high voltage electron microscope. This method allows the study of the dynamic behavior of dislocations under stress as hydrogen is added or removed from the specimen. This is the first of a series of papers which will describe the effect of hydrogen on the behavior of dislocations in iron. (10 refs.)

107706 Transverse banding in single crystals of $FeGe_2$ and $Fe_{0.99}Co_{0.01}Ge_2$. A.Yu.Bunkin, A.A.Frolov, S.V.Ustelemov (Ural Polytech. Inst., Sverdlovsk, USSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.119-21 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.203-5 (Jan.-Feb. 1983). [received: Sept. 1983]
Regular dislocation structures can occur in crystals of $Fe_{1-x}Co_xGe_2$. The authors detect these structures and examine their causes. After mechanical polishing, sections of the crystals were treated with SR-4 etching agent and studied under the optical microscope. (6 refs.)

107707 Dislocation etching of $KClO_4$ single crystals. V.P.Bhatt, R.M.Patel, C.F.Desai (Phys. Dept., Maharaja Sayajirao Univ., Baroda, India).
Surf. Technol. (Switzerland), vol.19, no.4, p.315-19 (Aug. 1983).
Chemical reagents for revealing dislocations which intersect the cleavage surface of $KClO_4$ single crystals were developed using various dispersing media with H_2SO_4. The etching characteristics of the etchants are discussed. In addition, the apparent activation energies involved in the etching process were determined, and the results are reported. (10 refs.)

107708 Formation of point defect clusters in electron-irradiated dilute FCC alloys. T.Ezawa, Y.Kawamata, M.Suehiro, M.Kiritani (Dept. of Materials Phys., Osaka Univ., Osaka, Japan).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.380-2
In situ electron irradiation experiments in a high voltage electron microscope have been carried out to study the influence of about 500 at. ppm of solutes on the formation of interstitial type dislocation loops. The addition of Sn, Sb and Ge to Au increases the number density and decreases its temperature dependence. The addition of Cu, Ag, Si, Zn and Mg to Al suppresses the formation of loops in each to a different degree. All the observed results are clearly understood from the strength of interaction of interstitial atoms with solutes which is definitely in the series of the volume size factor of solute atoms in the solvent. A possibility of the fast migration of strongly bound vacancy-solute pairs in gold-based alloys is inferred from the observed smaller temperature dependence of the growth speed of the loops. 107709 Energy absorption during deformation of yttrium and zirconium. A.L.Samsonik, G.A.Sirenko (Kharkov Univ., Kharkov, Ukrainian SSR).
Phys. Met. (GB). Translation of: Metallofizika, Kiev (USSR), vol.4, no.3, p.597-600 (1982). [received: Aug. 1983]
Stored strain energy Q_{sto}, i.e. energy accumulated by lattice defects generated by straining, is an important characteristic of plastically deformed crystals. The stored strain energy of hexagonal yttrium and zirconium obtained by the differential pulsed method demonstrates that: (a) the more brittle material (yttrium) stores a greater amount of energy at early deformation states than the more ductile material (zirconium); (b) the dislocation density estimated by stored strain energy is in good agreement with X-ray data. (8 refs.)

107710 $a\langle 100\rangle$ dislocation loops in MgO unusual configurations. G.Kameswara Rao (Advanced Centre for Materials Sci., Indian Inst. of Technol., Kanpur, India).
Phys. Status Solidi a (Germany), vol.78, no.2, p.697-703 (16 Aug. 1983).
A study is made of the formation of dislocation configurations generated at high temperatures as a result of diffused aliovalent impurity in single crystals of magnesium oxide by the gold decoration technique. A number of unusual dislocation loops are observed whose crystallography indicates that new slip sytems, which hitherto are not observed, are activated. The loops are long, narrow, and elongated with spikes developing at right angles to the elongation ([100]-direction). The plane of the loop itself is (100). A mechanism is suggested involving (i) the formation of a long narrow loop elongated along [100]-direction; (ii) spike formation along [010]-direction by the climb of a small portion of the edge dislocation segment constituting the narrow loop. (25 refs.)

107711 Effect of ageing on martensitic transformation during the deformation of metastable austenitic steels. L.S.Malinov, V.I.Konop-Lyashko.
Russ. Metall. (GB), no.3, p.112-15 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.130-3 (1982).
In the given steels, ageing may cause an ambiguous variation of stacking fault energy (SFE). Pinning the dislocations by the solute atoms during ageing or the precipitation of highly disperse particles causes a marked depletion of austenite in carbon and the alloying elements reduces SFE and destabilises austenite. Ageing should be used to control SFE and, consequently, austenite stability. This makes it possible to optimise the development of martensitic transformation in hardening austenite during loading and as a result obtain a high level of strength and ductility characteristics. (6 refs.)

107712 Use of the extinction effect to analyze the dislocation structures of crystals. A.N.Ivanov, P.I.Klimanek, Yu.A.Skakov (Inst. of Steel & Alloys, Moscow, USSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.58-61 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.109-14 (Jan.-Feb. 1983). [received: Sept. 1983]
For the traditional model of a mosaic crystal, the authors propose a method of separating the effects of primary and secondary extinction and simultaneously determining the mean block dimension and the angle of misorientation between blocks. The intensity of a reflection from a real crystal is regarded as the sum of the reflections from regions near a dislocation (calculated from the kinematic theory) and from the rest of the crystal (calculated from the dynamic theory). On the basis of this approach, for the case of a chaotic distribution of dislocations, expressions are obtained which enable the authors to find the dislocation density (provided that it does not exceed 10^7-10^8 cm^{-2}) from the value of the extinction parameter $Y=I_e/I_k$. The proposed approach can be used in structural crystallography to make corrections for extinction in analyzing the reflected intensities from polycrystalline aggregates and small single crystals. (12 refs.)

107713 Effect of ultrasound on the dislocation structure of alkali halide crystals in various orientations. E.P.Belozerova, A.A.Svetashov, N.A.Tyapunina (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.2, p.202-4 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.346-50 (March-April 1983). [received: Sept. 1983]
The dislocation structure in alkali halide crystals in various orientations is investigated by means of a composite piezoelectric oscillator at a frequency of 73 kHz with relative deformation amplitudes of 10^{-7}-10^{-3}. The authors elucidate the motion and multiplication of dislocations in specimens with nonzero orientation, due to differences in the Schmidt factor for planes of type (110) and to the presence of shear stresses in the transverse glide plane. 61.70N Grain and twin boundaries

107714 Energy of special grain boundaries deviating from the coherent positions. L.K.Fionova (Inst. of Steel & Alloys, Moscow, USSR).
Fiz. Met. & Metalloved. (USSR), vol.56, no.1, p.41-6 (July 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A calculation is reported of the additional energy of special boundaries with $\Sigma \leq 17$, associated with the presence of grain-boundary dislocations compensating the deviation of the plane of the boundary from a coherent position. The orientational dependence of this additional energy is obtained for a twin boundary with a symmetric initial orientation of the {111}, {112}, or {110} kind, and also for asymmetric positions. A study is made of the influence of the dislocation component of the grain-boundary energy on the driving force of boundary migration. (9 refs.) *A.T.*

107715 Effects at boundaries of recrystallized twins in overheated FCC crystals. E.S.Kucherenko (Metall. Inst., Dnepropetrovsk, USSR).
Fiz. Met. & Metalloved. (USSR), vol.56, no.1, p.155-9 (July 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
Formation of disperse liquid zones along coherent boundaries in overheated copper-base alloys with the FCC lattice was observed. This effect was due to decoration, by liquid phase centers, of structure defects in near-twin zones of crystals and it was evidence of a high density of defects near coherent boundaries. Melting around noncoherent twin boundaries confirmed the low value of the energies of the various regions of these boundaries. (9 refs.) *A.T.*

107716 Distribution of the atoms on grain boundaries and in the Bravais cell of the coincidence site lattice. N.An, R.Herrmann (Sektion Phys., Humboldt-Univ. zu Berlin, Berlin, Germany).
Phys. Status Solidi b (Germany), vol.118, no.2, p.691-702 (1 Aug. 1983).
The distribution of the atoms on symmetrical and asymmetrical coincidence grain boundaries in s.c., f.c.c., b.c.c., diamond, and zinc blende lattices is calculated. A general method is developed which allows one to detemine the number of atoms and the structure of the two-dimensional lattice of any grain boundary plane and of the planes next to grain boundary. (8 refs.)

107717 The nature of grain boundary sliding and the superplastic flow. R.Z.Valiev, O.A.Kaibyshev, V.V.Astanin, A.K.Emaletdinov (Ufa Aviation Inst., Ufa, USSR).
Phys. Status Solidi a (Germany), vol.78, no.2, p.439-48 (16 Aug. 1983).
Two types of grain boundary sliding are established and investigated during Zn bicrystal deformation: 'pure' grain boundary sliding (GBS) which is not associated with intragranular sliding (IS) and GBS which develops simultaneously with IS. Both types of GBS exhibit greatly similar structural peculiarities but under identical deformation conditions the second type GBS has a much higher rate with a m_{GBS} parameter decreasing from 1 to 0.4. The comparative analysis of GBS regularities in Zn bicrystals and the superplastic Zn-0.4% Al alloy attests to the fact that 'pure' GBS determines the strain hardening at superplastic deformation while GBS of the second type determines the development of the recovery processes. It is shown that these concepts may serve as a basis for the elucidation of many experimentally observed peculiarities of the superplastic flow—the existence of the initial unsteady and steady state stages, decrease of flow stress after short-term deformation at elevated rates, and others. (28 refs.)

107718 Cross-slip of twinning dislocations on crossing domain boundaries in ordered Ni_3V. G.Vanderschaeve, B.Escaig (Univ. des Sci. et Tech. de Lille, Villeneuve d'Ascq, France).
Philos. Mag. A (GB), vol.48, no.2, p.265-77 (Aug. 1983).
Zigzag propagation of deformation microtwins across the domain structure, as observed by electron microscopy in ordered Ni_3V alloy, is shown to be due to cross-slip of partial dislocations via the stair-rod mode (Fleischer 1959). Twin bands change direction to preserve the long-range order inside domains. The peculiarities of the interaction of twinning dislocations with domain boundaries are studied, and an activation energy for such a cross-slip mechanism is evaluated. It is shown that local stress concentration at the microtwin tip makes cross-slip easier. (21 refs.)

61.70P Stacking faults, stacking fault tetrahedra and other planar or extended defects

107719 Two kinds of stacking faults in InSb liquid phase epitaxial layers. Yu Zhenzhong, Ma Kejun, Jin Gang (Shanghai Inst. of Tech. Phys., Acad. Sinica, Beijing, China).
Chin. J. Semicond. (China), vol.4, no.4, p.407-9 (July 1983). In Chinese.
The experiments show that, in InSb liquid phase epitaxial layers, there exist two kinds of stacking faults, namely dumbbell- and pole-shaped faults. The feature and structure of the two faults and the interaction between them have been observed. Analysis indicates that the dumbbell-shaped faults belong to intrinsic faults, with Shockley partial dislocation around, while the pole-shaped ones probably belong to extrinsic faults. The mechanism forming the stacking faults is also discussed. (1 ref.)

107720 Multilayer stacking faults in b.c.c. metals. V.Paidar (Inst. of Phys., Czechoslovak Acad. of Sci., Praha, Czechoslovakia).
Philos. Mag. A (GB), vol.48, no.2, p.231-8 (Aug. 1983).
The symmetry of the unrelaxed energy of multilayer stacking faults on the {112} plane in the b.c.c. lattice is studied. The property that the single-layer fault energy does not depend on the sense of displacement in the ⟨111⟩ direction is generalized for multilayer faults. It is pointed out that the triple-layer fault deduced from the structure of the metastable ω phase may be stable, and furthermore that this fault is related to another fault which may be regarded as a distorted close-packed structure. 61.70T Doping and implantation of impurities

107722 Temperature processing effects in proton-implanted *n*-type GaAs. M.A.Mentzer (Advanced Technol. Div., Westinghouse Electric Corp., Baltimore, MD, USA), R.G.Hunsperger, J.M.Zavada, H.A.Jenkinson, T.J.Gavanis.
Appl. Phys. A (Germany), vol.A32, no.1, p.19-25 (Sept. 1983).
Characterization of the effects of thermal processing on the optical and electronic properties of proton implanted *n*-type GaAs is reported in this paper. The thermal processing includes variations in the substrate temperature during implantation and post-implantation thermal annealing. Infrared reflectivity data indicate that the depths to which the optical changes extend in the as-implanted samples are greatest in the cryogenic implants. Carrier concentration profiles derived from capacitance-voltage measurements are shown to have significant differences depending upon processing history. Existence of *n*-type surface layers are noted in high fluence level implants. (20 refs.)

107723 Sn ion doping during GaAs MBE with field ion gun. Y.Bamba, E.Miyauchi, K.Kuramoto, A.Takamori, T.Furuya (Optoelectronics Joint Res. Lab., Kawasaki, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.6, p.L331-2 (June 1983).
Low energy Sn ion doping of growing MBE GaAs at 550°C was made using a liquid metal field ion gun. From Raman measurements, no disordered structures were detected in the grown films. However, the films showed high resistivity and the activation of Sn differed from that of Zn for p-type ion doping previously reported. A broad and weak emission at around 1.28 eV was observed in a photoluminescence spectrum taken at 4.2K. These suggest that radiation damage caused by Sn ion irradiation remains in the films. (11 refs.)

107724 Formation of p^+-layer in GaAs by dual implantation of Zn and As. J.Kasahara, K.Taira, Y.Kato, M.Arai, N.Watanabe (Sony Corp. Res. Center, Yokohama, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.6, p.L373-5 (June 1983).
Dual implantation of Zn and As in GaAs resulted in a p^+-layer superior to that formed by the implantation of Zn only. Dual implantation improved the electrical activity of Zn significantly. The double-peak often observed in the hole concentration profile of the sample by the implantation of Zn only was

eliminated by equal dose co-implantation of As, in which the hole concentration profile was Gaussian-like with a peak at the projected range (R_p) of Zn. The equal dose coimplantation of As also resulted in lower sheet resistance, suggesting that stoichiometry in the implanted layer is essential for activating implanted impurities in GaAs effectively. (9 refs.)

107725 Doping of germanium telluride with bismuth and copper. N.Kh.Abrikisov, O.G.Karpinskii, T.Sh.Makalatiya, L.E.Shelimova (A.A. Baikov Inst. of Metall., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.9, p.1286-504 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1504-9 (Sept. 1982). [received: Sept. 1983]
It has been shown that double doping of germanium telluride with bismuth an copper produces and increase in the degree of rhombohedral distortion of the lattice of the α phase and in the temperature of the $\alpha \rightarrow \beta$ phase transitions and also an increase in the volume change at the phase transition point for a constant GeTe content as the ratio between the number of bismuth and copper atoms shifts in favor of the latter. It has been shown that the performance of the double doping is determined by the concentration of the copper atoms and by the concentration of the electrically neutral cation vacancies produced in the solid solution matrix by the bismuth tellurides introduced into the GeTe. Differences have been established in the electrophysical properties of the alloys obtained by double doping in relation to the mode of introduction of the copper: as Cu_2Te or as elemental copper. (8 refs.)

107726 Photodoping of Ag into single crystal As_2S_3. T.Imura, K.Kubota, A.Hiraki, K.Tanaka (Dept. of Electrical Engng., Osaka Univ., Osaka, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2459-61 (July 1983).
Photodoping of silver into the cleaved surface of single crystal As_2S_3 (natural orpiment) was observed by electrical resistance measurements and Rutherford backscattering spectrometry. The initial stage of the phenomenon was concluded to be photo-oxidation of silver at the interface between silver and As_2S_3, and was proved to be independent of the amorphous nature like photodarkening observed in amorphous chalcogenides. (9 refs.)

107727 The influence of ion implantation on the thermal oxidation of copper. P.J.Ratcliffe, R.A.Collins (Dept. of Phys., Univ. of Lancaster, Lancaster, England).
Phys. Status Solidi a (Germany), vol.78, no.2, p.547-53 (16 Aug. 1983).
The effect of 31 species of ion implanted impurities on the thermal oxidation of polycrystalline copper, and nine implanted species on the oxidtion of single crystal (110) copper is studied. The majority of these increased the oxidation resistance of the copper, the greatest effect on oxidation being caused by chromium (88% decrease), platinum, and hafnium. An increase in the degree of oxidation is found with increasing ionic radius of the implanted species. A drastic (174%) increase in the oxidation induced by vanadium implantation is associated with changes in the morphology of the oxide. The results generally support a model based on the formation of a p-n junction in the implanted oxide. (35 refs.)

107728 On the effect of ambients on the formation of oxygen-related donors in Cz-Si. K.Schmalz, P.Gaworzewski (Inst. fur Phys. Werkstoffbearbeitung, Akad. der Wissenschaften, Berlin, Germany).
Phys. Status Solidi a (Germany), vol.78, no.2, p.K141-5 (16 Aug. 1983).
In oxygen-rich Si, oxygen-related donors (OD) are introduced due to heat treatment (HT) in the temperature range 600 to 900°C. The authors investigate the effect of ambients on OD formation in Cz-Si. The experimental results show that OD formation can be influenced by the ambient of HT. The OD formation due to HT in oxidizing ambients is retarded compared to HT in inert ambients. In dependence on the temperature of HT the OD formation can even be suppressed due to a preoxidation at high temperatures. (8 refs.)

107729 Calculation of project ion-range distribution moments in compounds and alloys. I. Range distribution moments for heavy ions ($Z_1 > 10$). Xia Yue-yuan (Dept. of Phys., Shandong Univ., China), Yang Hong, Tan Chun-yu, Li Jin-hua.
Acta Phys. Sin. (China), vol.32, no.4, p.423-45 (April 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)* [received: Sept. 1983]
Project range and range distribution moments up to third order for twelve ion species implanted into five different substrates (such as amorphous Al_2O_3, SiO_2, UO_2, $LiNbO_3$ and 20/25/Nb stainless steel) are calculated using an improved nuclear scattering function developed recently. Some results are given for the ions considered with energy range from 5 keV to 1 MeV. The present theoretical results are compared with those published by Gibbons et al. (1975) and Winterbon (1975), and the authors' results are shown to agree with the recent experimental measurements more closely. The calculation method which deals with the range distribution moments in amorphous compounds and alloys is presented in some detail, and a brief discussion on the calculation accuracy is given. (25 refs.)

107730 RBS measurements of the nitrogen concentration in diamonds. A.Katern, E.A.Burgemeister, J.F.M.Westendorp, H.E.Roosendaal (Fakultat fur Phys., Univ. Bielefeld, Bielefeld, Germany).
Mater. Lett. (Netherlands), vol.2, no.1, p.71-3 (July 1983).
The nitrogen content in a depth up to 500 Å of three type IaA, two mixed type and two type IaB diamond plates has been determined by Rutherford backscattering spectroscopy (RBS). The natural concentration of carbon-13 served as an intrinsic reference for an absolute determination of the nitrogen content. The RBS results are compared with the nitrogen concentration, obtained from IR-absorption measurements. (17 refs.)

107731 Measurement of substrate impurity concentration by the use of alpha-particle radiation. C.M.Hsieh, R.R.O'Brien (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.26, no.2, p.632-3 (July 1983).
The impurity concentration of a substrate is determined accurately and conveniently in a nondestructive manner by the use of alpha particle radiation. (no refs.)

107732 Physicochemical investigation of melts and single crystals of lithium tantalate. V.F.Tkachenko, M.B.Kosmyna, T.S.Teplitskaya, L.A.Egorova, N.F.Efremova (All-Union Sci.-Res. Inst. of Single Crystals, Scintillation Materials & High-Purity Chem. Substances, USSR).
Inorg. Mater. (USA), vol.18, no.8, p.1152-5 (Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.8, p.1359-62 (Aug. 1982).
The degree and nature of the contamination of melts and single crystals of lithium tantalate, grown from molybdenum and iridium crucibles, were investigated by X-ray diffractometric, chemical, and optical methods of analysis. It was established that the bulk of the molybdenum impurity is in a lithium tantalate melt in the form of mechanical inclusions, and part (<0.1% by weight) is incorporated into the crystal lattice of lithium tantalate. (2 refs.)

107733 Distribution of Cu between solid CdS and liquid $CdCl_2 + CdS$. M.E.Altosaar, P.L.Kukk (Tallin Polytech. Inst., Tallin, USSR).
Inorg. Mater. (USA), vol.18, no.9, p.1259-62 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1475-8 (Sept. 1982). [received: Sept. 1983]
Analysis of the electrical and luminescence experimental data on the distribution of copper between solid CdS and liquid $CdCl_2 + CdS$ leads to the conclusion that for $[Cl] > [Cu]$ the main defect caused by the copper in the cadmium sulfide is a single copper atom on the cadmium sublattice associated with one or two chlorine atoms on the sulfur sublattice. (18 refs.)

107734 Calculations on the laser-induced diffusion of surface-deposited dopants on silicon. H.S.Tan, C.K.Ong (Dept. of Phys., Nat. Univ. of Singapore, Singapore).
J. Phys. C (GB), vol.16, no.25, p.5063-72 (10 Sept. 1983).
A theoretical method for the calculations of dopant redistribution in pulsed laser annealing is introduced. A loss mechanism that allows an outflow of dopant atoms across the substrate surface is included in this method. The present work also suggests a triangular approximation to the full melt histories employed in the dopant redistribution calculations. The calculated dopant profiles obtained with the full melt histories and the triangular approximations are compared with the dopant profiles measured with Rutherford backscattering, spectroscopy. In the analysis of laser-induced diffusion of surface-deposited antimony on silicon, it is found that the loss mechanism is essential for the theoretical fitting of the measured dopant profile. The variation of the maximum melt depth with laser energy is also briefly discussed. (14 refs.)

107735 Impurity composition and surface-layer state of diphenyl crystals. E.D.Dukova, A.I.Ogloblina, R.M.Myasnikova (Inst. of Crystallography, Acad. of Sci., USSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.86-2 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.146-56 (Jan.-Feb. 1983). [received: Sept. 1983]
On diphenyl crystals formed by recrystallization from powder in an evacuated ampoule, the authors found the distribution of organic impurities by the spectral fluorescence method in the (001) and (111) growth pyramids and in the initial boule. They took the NMR spectrum of the diphenyl powder. They examined the P-T and T-C diagrams for diphenyl and the found impurities (acenapthene and anthracene). On the basis of this investigation they con-

cluded that diphenyl crystals from the vapor phase grow with aid of an intermediate layer of solid and liquid solutions. (14 refs.)

61.70Y Interaction between different crystal structure defects

107737 Trapping of hydrogen by substitutional and interstitial impurities in α-iron. A.I.Shirley, C.K.Hall (Dept. of Chem. Engng., Princeton Univ., Princeton, NJ, USA).
Scr. Metall. (USA), vol.17, no.8, p.1003-8 (Aug. 1983).
The elastic and electronic interactions of hydrogen with substitutional and interstitial impurities in α-iron are calculated. The study of trapping of hydrogen in iron is of practical interest to the iron and steel industry since trapping can suppress hydrogen embrittlement. To understand better the relationship between trapping and embrittlement it is helpful to be able to predict which impurities will trap hydrogen and to quantify the magnitude of this interaction. The results of the calculation on substitutional impurities show that all of the impurities considered here have an elastic interaction with hydrogen in iron which is attractive. The electronic interaction, however, is found to be attractive for impurities which lie to the left of iron in the periodic table but is repulsive for impurities lying to the right. (34 refs.)

107738 Elastic interaction in dislocations with orthorhombic and [001]-monoclinic point defects in HCP crystals. M.M.Savin, V.M.Chernov (Physicoenergetic Inst., Obninsk, USSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.62-5 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.115-22 (Jan.-Feb. 1983). [received: Sept. 1983]
By methods of the anisotropic theory of elasticity the authors calculate the interaction energy of dislocations with all orientations of orthorhombic and [001]-monoclinic point defects (elastic dipoles) in crystals with hexagonal close-packed structure. The following slip systems are considered: basal, $(0001)1/3\langle 11\bar{2}0\rangle$, prismatic $\{10\bar{1}0\}$ $1/3\langle 11\bar{2}0\rangle$ and $\{10\bar{1}0\}$ $\langle 0001\rangle$, second-order pyramidal $\{11\bar{2}2\}$ $1/3\langle 11\bar{2}3\rangle$, and first-order pyramidal $\{10\bar{1}1\}$ $1/3\langle 11\bar{2}0\rangle$ and $\{10\bar{1}1\}$ $1/3\langle 11\bar{2}3\rangle$. Calculations are made for edge and screw dislocations in all these slip systems except for the first-order pyramidal $\{10\bar{1}1\}$ $1/3\langle 11\bar{2}3\rangle$ in which mixed and screw dislocations are considered. The resulting expressions include as a special case the well-known expressions for trigonal and hexagonal point defects. In contrast, orthorhombic defects (four of six orientations) and [001]-monoclinic defects (all 12 orientations) interact with screw dislocations with Burgers vectors $b=1/3\langle 11\bar{2}0\rangle$. Like trigonal and hexagonal point defects, orthorhombic and [001]-monoclinic defects do not interact with screw dislocations with $b=\langle 001\rangle$. (10 refs.)

107739 Calculation of interaction energy between atomic defects in BCC transition metals: vacancy-vacancy, vacancy-vacancy cluster, and vacancy impurity pairs. K.Masuda (Dept. of Materials Sci. & Engng., Tokyo Inst. of Technol., Yokohama, Japan).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.105-8
A tight-binding type electronic theory is used to calculate the atomic relaxations and binding energies E_{bin} of the vacancy-type lattice defects in BCC transition metals. The short-range repulsive energies between neighbouring atomic sites are simulated by a Born-Mayer potential. Binding energies of di-vacancies, small vacancy clusters (up to tetra-vacancies) and vacancy-interstitial impurity pairs are obtained using the direct energy minimization procedure. It is shown that E_{bin} and electronic density of states of d-electrons around the vacancy-type lattice defects (calculated using the recursion method) are very sensitive to the structure of atomic defects (configuration of vacancies). (12 refs.)

107740 Pseudopotential formulation of point defect interactions in metals. O.Takai, M.Doyama, Y.Hisamatsu (Dept. of Metall. & Materials Sci., Univ. of Tokyo, Tokyo, Japan).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.109-12
The electronic interactions between various point defects have been formulated using the pseudopotential theory. The distortions of the lattice around point defects were conventionally neglected because of their great complexity. The authors considered a vacancy, nonsplit interstitials, split interstitials, a substitutional impurity, nonsplit interstitial impurities, and split interstitial impurities as point defects. The formulation has been carried out for twenty-one types of the effective interaction potentials between two point defects denoted above. (9 refs.)

107741 Interactions between point defects in HCP metals. O.Takai, M.Doyama, Y.Hisamatsu (Dept. of Metall. & Materials Sci., Univ. of Tokyo, Tokyo, Japan).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.113-16
The vacancy-vacancy, vacancy-interstitial, interstitial-interstitial, vacancy-impurity (both substitutional and interstitial types), interstitial-impurity, and impurity-impurity interaction potential have been calculated in Mg, Zn, and Cd using the Ashcroft model potentials and the Hubbard-Sham exchange and correlation corrections in the dielectric function of the conduction electrons. The binding energies of a divacancy, sixteen kinds of vacancy-substitutional impurity pairs, and sixteen kinds of substitutional impurity pairs have also been calculated. The interaction potentials have been applied to the study of small point-defect clusters, for which the configurations and the binding energies have been discussed. (6 refs.)

107742 Dipolar point defect interactions with stress fields. Y.Kogure, W.K.B.Ho, A.V.Granato (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.153-5
Elastic dipole-stress interactions are discussed in the light of ultrasonic experiments. Especially examined is the characteristic behavior of quantum dipoles. Experiments on RbCl:OH systems are shown to prove a suitable example, and static bias stress experiments have been developed to obtain information about internal stresses in crystals. (4 refs.)

107743 Interstitial-impurity interactions in aluminum and copper alloys. A.V.Granato (Dept. of Phys. & Materials Res. Lab., Univ. of Illinois, Urbana, IL, USA), J.Holder, K.L.Hultman, D.L.Johnson, G.G.Setser, P.Wallace, H.Wong.
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.360-3
Ultrasonic attenuation and velocity measurements have been made in Al-Mn, Al-Fe, Al-Zn, Al-Ag, Al-Zn-Fe, Al-Mg and Cu-Ag irradiated with 2.5 MeV electrons. Both dielastic and parelastic effects are obtained as well as an ultrasonic determination of the resistivity change for interstitial concentrations of the order of few ppm. Both the dielastic and parelastic effects show strong polarization effects. The frequency and annealing temperature dependence provide information on reorientation, binding and migration enthalpies and frequency factors. In general, several peaks appear which are specific to each impurity. Although Fe and Mn have similar mass and size differences with Al, the results for the two alloys are very different, contrary to expectations from existing theory. Evidence for the caged mixed dumbbell configuration is obtained for Al-Zn and Al-Ag. In Al-Zn, it is found additionally that the mixed dumbbell tunnels between equivalent configurations and disappears near 140K without dissociating. In contrast to Al alloys with undersized impurities, the peaks in Al-Mg and Cu-Ag are smaller and increase with annealing near 130K before disappearing in Stage III. The changes in peak heights correlate well with resistivity changes. (9 refs.)

107744 Molecular dynamics study of interstitial-solute interactions in irradiated Al-based alloys. N.V.Doan (Section de Recherches de Metall. Phys., CENS, Gif sur Yvette, France), N.Q.Lam, L.Dagens, Y.Adda.
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.372-5
The stable configurations and binding energies of interstitial and di-interstitial-solute complexes in Al-Be, Al-Ca, Al-K, Al-Li, Al-Mg and Al-Zn alloys were calculated using the molecular dynamics technique in conjunction with interatomic potentials derived entirely from theoretical considerations and not fitted to any experimental data. All the results reported are thus of a first-principle nature. (11 refs.)

107745 Interaction between self-interstitial and solute atoms in gold. K.Nakata, J.Takamura, K.Furukawa (Dept. of Metal Sci. & Technol., Kyoto Univ., Kyoto, Japan).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.376-9
The interaction between self-interstitial (I) and solute (S) toms has been examined in electron-irradiated gold: (a) The radiation-induced resistivity rapidly increases for solutes that differ from the solvent in atomic size by more than 20%. (b) Undersized solutes such as Cu and Ni interact strongly with self-interstitial atoms, and show two distinct substages connected with a long plateau in stage II, which are responsible for the dissociation of $IS \rightarrow I+S$ and $I_2S \rightarrow I_2+S$, whose energies are about 0.3 and 0.5 eV, respectively. (c) Oversized solutes such as Sb and Sn increase markedly the amount of recovery in stage II, and in particular Pb with an extraordinarily large atomic size has specific trapping configurations different from other oversized solutes. (12 refs.)

107746 Self interstitial atom interactions with point defects and impurities in Cu, Al, Ag matrices. F.Maury, P.Lucasson (Univ. Paris-Sud, Orsay, France), A.Lucasson, P.Vajda, C.Dimitrov, O.Dimitrov, J.Le Hericy, G.Mathieu.
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.383-8
The interaction radii of self interstitial atoms with vacancies and a number of impurities in the pure metals and dilute alloys of Cu, Ag, Al have been determined by electrical measurements and the stage I_d-I_e recovery analysis method. The discussion of the results leads to reassess the well known damage build up method used in the unsaturable trap approximation. It is concluded that this approximation may be inadequate in numerous cases. The methods complement each other and should be used in parallel. (24 refs.)

107747 A method for studying the self-interstitial trapping at impurity atoms in an irradiated metal and the resulting defect distribution as a function of the temperature. F.Maury, P.Lucasson (Univ. Paris XI, Orsay, France).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.389-91
Presents a rapid survey and analysis of the reasons of the discrepancies between the values given by either one of the two methods traditionally used for determining trapping radii, r_t, of self-interstitials by impurities: the recovery method and the damage rate method. The two main factors which are to be taken into account and can lead to wrong estimates if neglected, are the multiple trapping which governs the cluster formation, and the decrease in resistivity which can result from the trapping, especially in the case of mixed dumbbell formation. It is shown that only a combination of the two methods, both involving the same kind of analysis based on a simple chemical rate model, can provide a reliable value of $R_t=(r_t/r_v)$ when nothing is known of the various possible trapping configurations. (13 refs.)

107748 Interaction between vacancies and hydrogen atoms in aluminum. E.Hashimoto, K.Ono, Y.Murakami, T.Kino (Lab. of Crystal Phys., Hiroshima Univ., Hiroshima, Japan).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.496-9
Hydrogen permeation through aluminum was measured by using a quadrupole mass spectrometer, and the hydrogen diffusivity was determined. The diffusivity depends on the concentration of vacancies relative to that of dissolved hydrogen. At high temperatures where the vacancy concentration is much larger than that of hydrogen, the activation energy of hydrogen diffusion is near the migration energy of a vacancy in aluminum. The results suggest a strong interaction between a hydrogen atom and a vacancy. Furthermore, the binding energies between a hydrogen atom and solutes were discussed in a similar experiment on Al-Mg and Al-Si alloys. (11 refs.)

107749 The interactions between gas impurities and defects in Mo studied by the positron annihilation technique. B.Nielsen, A.van Veen, L.M.Caspers, W.Lourens (Lab. of Appl. Phys. II, Tech. Univ. of Denmark, Lyngby, Denmark), W.Wierzchowski, H.E.Hansen, G.Trumpy, K.Petersen.
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.500-3
The interaction between gas impurities and defects in Mo has been studied by the positron annihilation technique. It was possible to observe interaction with vacancy loops, vacancies and voids. Hydrogen was shown to decorate vacancy loops, whereas no interaction with voids was detected. The observed interaction of a gas impurity with voids is most likely due to nitrogen. The presence of nitrogen in interstitial position leads to a strongly enhanced vacancy production by electron irradiation. Isochronal annealing of two nitrogen doped and electron irradiated samples showed nitrogen filling of vacancies at around 160°C, which the authors attribute to interstitial migration of nitrogen. The free migration of vacancies in stage III, i.e. around 240°C, was totally suppressed, i.e. no clustering of vacancies or loss to sinks was observed. (10 refs.)

61.80 RADIATION DAMAGE AND OTHER IRRADIATION EFFECTS

(for techniques of structure determination, see 61.10 to 61.16; for electron and ion impact phenomena, see 79.20)

107750 Investigation of cascade-induced point-defect fluctuations. H.Gurol (Sci. Applications Inc., La Jolla, CA, USA), W.G.Wolfer.
J. Nucl. Mater. (Netherlands), vol.117, p.244-9 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
High energy irradiation produces collision cascades, which occur randomly in space and time. Any given point in the material will therefore be subject to intermittent arrival of interstitials and vacancies, even under steady irradiation. The conventional rate theory formulation of the point-defect concentrations, which contains spatial and time averaging and a uniform production rate, may not always adequately describe processes such as void nucleation and irradiation creep. The author develops a theoretical approach to describe the cascade-induced point-defect fluctuations by their moments. The first moment, giving the average point-defect concentration, is used in the traditional rate theory. However, the second moment provides the variance of the point defect concentration, and it becomes important for processes such as void nucleation, dislocation climb, and loop growth. An approximate analytical expression is given for the second moment. The obtained concentration variances compare well with numerical results. It is demonstrated with the example of climb-induced dislocation glide how the moments can be used to extend rate theory results. Large enhancement in the creep rate due to point defect fluctuations can be obtained if the barrier size and the average climb rate are small and if the cascade size is large. (10 refs.)

107751 The effect of neutron and He-irradiation on the crack modes of type 316 stainless steel. T.Hanamura, W.A.Jesser (Dept. of Materials Sci., Univ. of Virginia, Charlottesville, VA, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.308-19 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
An investigation was carried out in order to determine the crack opening mode (Mode I and Mode II) during in situ HVEM tensile testing and how it is influenced by neutron and helium irradiation, and test temperature. Mode II crack opening was observed as grain boundary sliding initiated by a predominantly Mode I crack steeply intersecting the grain boundary. Mode II crack opening was absent in neutron- or helium-irradiated specimens tested between 400°C and room temperature, but could be restored by a post-irradiation anneal. (8 refs.)

107752 Displacement cascades in polyatomic materials. D.M.Parkin, C.A.Coulter (Los Alamos Nat. Lab., Los Alamos, NM, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.340-4 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
Using a continuous slowing-down, random amorphous material model, the authors have studied displacement cascades in a number of diatomic materials. They review a number of previously obtained results that elucidate the effect of atomic mass, reocil enegy, displacement energy, capture energy and material stoichiometry on the numbers of displacements in a cascade. The displacement cascade reveals a complex structure that is dependent on the type of irradiation and the material properties. Conclusions related to damage analysis for fusion reactors are given. (13 refs.)

107753 Incoherent focused radiation for activation of implanted InP. J.P.Lorenzo, D.E.Davies, K.J.Soda, T.G.Ryan, P.J.McNally (Rome Air Dev. Center, Hanscom AFB, MA, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.683-8
InP layers implanted with Si^+ ions are successfully activated through the use of a focused incoherent energy source. High mobility values and excellent carrier concentrations, both directly comparable to values attained using conventional furnace annealing, are achieved with this technique. Under optimized anneal conditions, electrical evaluation also indicates no surface anomalies such as those encountered with pulsed laser or electron beam annealed InP. (8 refs.)

61.80B Laser beams

107754 Test for nonthermal transient annealing in silicon. J.E.E.Baglin, R.T.Hodgson (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), J.M.Neri, R.Fastow.
Appl. Phys. Lett. (USA), vol.43, no.3, p.299-301 (1 Aug. 1983).
The proposition that nanosecond pulsed laser annealing of implanted silicon is accomplished by electron plasma interactions (below 1700K) has been tested by comparing the threshold energy densities required for epitaxial regrowth, using intense pulsed beams of B^+ and Ba^+ ions. Thresholds for 250-ns pulsed B^+ (210 keV) (90% electronic energy deposition in Si) and Ba^+ (285 keV) (44% electronic, 56% collisional) are identical, indicating that the mode of initial energy coupling to the solid is not important. The results agree with quantitative predictions for a normal thermal melting process. (8 refs.)

107755 CW laser-annealing behavior of Se^+-implanted InP investigated by ellipsometry. M.Mizuta, J.L.Merz (Dept. of Electrical & Computer Engng., Univ. of California, Santa Barbara, CA, USA).
Appl. Phys. Lett. (USA), vol.43, no.4, p.375-7 (15 Aug. 1983).
Damage removal of Se^+-implanted InP after CW Ar^+ laser annealing has been monitored by measurement of the optical extinction coefficient *k*. A gradual decrease in *k* as a function of laser power is observed for room-temperature ion-implanted InP samples, compared to a sharp decrease in *k* for ion-implanted Si. These data and electrical measurements indicate that the ion-implantation damage removal process for InP is more complex than for Si. (16 refs.)

107756 Temperature distribution in CW CO_2 laser annealed silicon samples. L.Nanu, E.Cojocaru, I.N.Mihailescu (Central Inst. of Phys., IPTRA, Magurele, Rumania).
Rev. Roum. Phys. (Rumania), vol.28, no.5, p.425-9 (1983).
A numerical treatment of the thermal phenomena during cw CO_2 laser annealing of implanted semiconductors is presented. The nonlinear heat equation with source term was solved using a Crank-Nicholson implicit method. The temperature distribution in the silicon sample for two values of the incident laser power is comparatively given. (11 refs.)

107757 Transient annealing of ion implanted gallium arsenide. J.S.Williams (JMRC, Faculty of Engng., Royal Melbourne Inst. of Technol., Melbourne, Australia).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.621-32
Provides a brief overview of the application of transient annealing to the removal of ion implantation damage and dopant activation in GaAs. It is shown that both the liquid phase and solid phase annealing processes are more complex in GaAs than those observed in Si. Particular attention is given to observations of damage removal, surface dissociation, dopant redistribution, solubility and the electrical properties of GaAs. The various annealing mechanisms are discussed and areas in need of further investigation are identified. (62 refs.)

107758 Neutron activation measurements of As and Ga loss during transient annealing of GaAs. A.Rose, J.T.A.Pollock, M.D.Scott (Div. of Chem. Phys., CSIRO, Sydney, NSW, Australia), F.M.Adams, J.S.Williams, E.M.Lawson.
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.633-9
Significant dissociation is normally detected under non-optimised transient annealing of GaAs. The authors have utilised neutron activation to measure As and Ga loss from virgin and implanted material annealed under various transient conditions. Complementary RBS data are reported. In particular, surface dissocation has been measured as a function of pulsed ruby laser power and for several combinations of time and surface temperature using an incoherent light source and a vitreous carbon strip heater. The results indicate that neutron activation analysis offers a powerful tool to identify the conditions required to minimise GaAs dissociation during annealing. For example, ruby laser pulses of energy 0.29-1.38 J cm^{-2} caused As loss of 4-90$\times 10^{14}$ cm^{-2}. (13 refs.)

107759 Pulsed UV laser irradiation of ZnS films on Si and GaAs. H.S.Reehal, C.B.Thomas, J.M.Gallego, G.Hawkins (Dept. of Appl. Phys., Univ. of Bradford, Bradford, England), C.B.Edwards.
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.677-82
Pulsed XeCl (308 nm) and XeF (351 nm) laser annealing of undoped and Mn-implanted single crystal and polycrystalline ZnS films deposited upon either Si or GaAs substrates is described. Annealing energy densities in the range ~0.6-2.5 J cm^{-2} have been employed, with the specimens held under an Ar environment at ~100-200 psig pressure. Film thicknesses in the range ~0.2-1.0 μm have been investigated, with the substrates cleaned in various ways prior to deposition. In all the cases investigated, laser annealing results in polycrystalline regrowth of the films as shown by RHEED analysis. Furthermore the RHEED patterns obtained are consistent with the presence of both the cubic and the hexagonal phases of ZnS, except for thin (~0.2 μm thick) films annealed above ~2 J cm^{-2}. These show a purely cubic structure on both Si and GaAs, possibly due to regrowth from the underlying cubic substrates. (10 refs.)

107760 Pulsed laser melting of metallic glasses. A.K.Jain, D.K.Sood (Nuclear Phys. Div., Bhabha Atomic Res. Centre, Bombay, India), G.Battaglin, A.Carnera, G.Della Mea, V.N.Kulkarni, P.Mazzoldi, R.V.Nandedkar.
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.703-8
Studies pulsed ruby laser melting of metallic glasses—Fe40Ni40P14B6 and Fe40Ni40B20. Both amorphous and crystallised samples were used, and some of them were implanted with Ru to serve as a marker species. SEM measurements on surface topography and RBS depth profiling of Ru marker redistribution were used to establish melting above about 1 J/cm^2. Heat flow calculations and liquid phase diffusion analysis of the Ru marker species under a moving melt front have been performed. The flat Ru depth profiles at high energy densities arise from convection effects. Results on crystallised and amorphous samples are similar. TEM measurements of quenched regions on a crystallised sample show an unexpected absence of amorphous phase. (15 refs.)

61.80E Gamma rays

107761 Donor complexes with interstitial indium atoms following low-temperature gamma irradiation of indium antimonide. F.A.Zaitov, O.V.Gorshkova, A.Ya.Polyakov.
Inorg. Mater. (USA), vol.18, no.11, p.1528-30 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1781-3 (Nov. 1982).
From an analysis of data in the literature it is concluded that with low-temperature gamma irradiation of n-InSb, complexes of donor atoms with interstitial indium atoms are formed. These complexes correspond to an acceptor level $E_c = -0.03$ eV. The acceptors at $E_v = +0.04$ eV formed after n-p conversion in n-InSb with low-temperature gamma irradiation are most probably complexes of donor atoms with two interstitial indium atoms. (10 refs.)

107762 Debonding of epoxy from glass in irradiated laminates. C.E.Klabunde, R.R.Coltman,Jr. (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.345-50 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
Glass fabric filled epoxies irradiated at 4.7K and examined at room temperature by 20× stereomicroscopy showed an internal flaw structure which increasingly filled the sample as the γ dose was increased. These flaws were determined to be areas where the plastic had debonded from the glass fibers. The extent of this process correlated well with the dose-dependent loss of mechanical strength. Evidence is reported for a similar mechanism in polyimides although visible flaws have not yet been produced. Possible mechanisms for debonding are suggested. New experiments are also suggested to further clarify the failure mechanism. (5 refs.)

107763 The effect of gamma radiation on the mechanical properties of corundum. V.Brozek (Inst. of Chem. Technol., Prague, Czechoslovakia), M.Matusek, J.Zemlicka.
Silikaty (Czechoslovakia), vol.27, no.3, p.245-51 (1983). In Czech.
Radiation of the ^{60}Co brings about changes in the mechanical properties of corundum within the dose range 0.1-2.0 MGy. Above the statistical 5% significance level, the most pronounced effect is a decrease in microhardness of monocrystals prepared by the Verneuill method, a decrease in the individual strength of corundum polycrystalline grains, and a decrease in the elasticity modulus of the monocrystals. On the other hand, the brittleness of polycrystalline corundum increases together with the values of secondary mechanical characteristics, such as an increasing grinding ability of free and bound corundum abrasives. The respective changes can be explained by the creation of radiation defects which reduce the bond strength in the corundum crystal structure. (8 refs.)

61.80F Electrons and positrons

107764 Large area electron beam annealing. C.A.Moore, J.J.Rocca, T.Johnson, G.J.Collins (Colorado State Univ., Fort Collins, CO, USA), P.E.Russell.
Appl. Phys. Lett. (USA), vol.43, no.3, p.290-2 (1 Aug. 1983).
The authors have achieved wide area (38 cm^2) electron beam annealing of ion implanted silicon wafers using a glow discharge electron beam with electron energies between 3 and 7 keV. A continuous beam 7 cm in diameter with a power density up to 90 W/cm^2 was used to anneal the 7-cm-diameter central portion of boron-implanted (30 keV, 5$\times 10^{15}$ atoms/cm^2) *n*-type ⟨100⟩ silicon wafers 10 cm in diameter. Annealing was obtained without redistribution of the original dopant profile using a 15-s electron beam exposure. Due to the high electron beam power density achieved over a large area, one can uniformly anneal an entire wafer in a single exposure without sample or beam scanning. (7 refs.)

107765 Investigation of localized annealing by electron beams. H.T.Sun, R.A.McMahon, H.Ahmed (Dept. of Engng., Cambridge Univ., Cambridge, England).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.827-31 (July-Sept. 1983).
An improved method of localized annealing with electron beams—selective repeat electron beam scanning (SREBS)—is described. The annealed region better delineated than with single scan localized annealing. Three characteristic types of cross sections, perpendicular to an annealed line have been investigated to determine the extent of e-beam induced damage in the ion implanted layer and the substrate. The resolution of the annealed region is limited by edge phenomena caused by the local temperature gradient. (6 refs.)

107766 Radiation-induced defect formation in InSb doped with Gd, Ge, Cu, Ag, Zn, and Cd. F.A.Zaitov, O.V.Gorshkova, A.Ya.Polyakov, A.I.Popkov, M.D.Khlystovskaya.
Inorg. Mater. (USA), vol.18, no.11, p.1525-8 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1777-80 (Nov. 1982).
The electrical properties of indium antimonide strongly doped with gadolinium are determined at low temperatures by acceptors with E_v=0.012-0.014 eV, as probably being complexes of indium vacancies with oxygen. The effect on these properties of 25 MeV electron irradiation is also studied. In p-InSb crystals weakly doped with Gd a major role is played by uncontrolled contaminant impurities (copper). The concentration of holes in p-InSb crystals doped with Gd changes significantly more slowly than in the case of the other impurities. (17 refs.)

107767 The kinetics of electron-beam dispersion of polymers when obtaining coatings. A.V.Rogachev, V.V.Kharitonov (Inst. of Railroad Transport Engrs., Gomel, USSR).
J. Eng. Phys. (USA), vol.44, no.1, p.88-90 (Jan. 1983). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.44, no.1, p.105-8 (Jan. 1983). [received: Sept. 1983]
The kinetics of the variation in surface charge is considered, taking into account its destruction when acted upon by a beam of electrons. The experimentally established features of dispersion kinetics can be explained by the presence of a surface charge. (4 refs.)

107768 Electron beam processing of semiconductors. H.Ahmed, R.A.McMahon (Engng. Dept., Cambridge Univ., Cambridge, England).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.653-64
Electron beams can transfer energy very efficiently to semiconductors. Systems have been developed for rapid heating to temperature around 1000°C under a variety of conditions from adiabatic to isothermal. Pulsed, focused, line and synthesized shaped beams are used to obtain a wide range of thermal cycles. The following applications are described: the annealing of ion-implanted Si, particularly the activation of As implants and shallow implants ($R_p < 150$Å), the annealing of Si and Se in GaAs, the e-beam processing of implanted silicon devices and the improvement of SOS substrate quality. Localized annealing by a computer controlled e-beam and the recrystallization of deposited films on insulators are also considered. (33 refs.)

107769 Metastable Fe(Pd) alloys formed by pulsed electron beam melting. D.M.Follstaedt, J.A.Knapp (Ion Solid Interactions, Sandia Nat. Lab., Albuquerque, NM, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.745-50
Fe(Pd) surface alloys formed by either ion implanting Pd into Fe or by vapor depositing Pd on Fe have been examined after pulsed ($\sim$70 nsec) electron beam melting. TEM and ion backscattering/channeling showed that the implanted alloys with up to 9.6 at.% Pd were BCC and epitaxial with the substrate, in spite of predictions of initial solidification to the FCC phase by the Fe-Pd phase diagram. The resolidified Pd films, however, were FCC as predicted by the diagram. The defect structures observed in these alloys are discussed. (7 refs.)

107770 Amorphous Al(Ni) alloy formation by pulsed electron beam quenching. S.T.Picraux, D.M.Follstaedt (Sandia Nat. Lab., Albuquerque, NM, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.751-6
The microstructural transition from the epitaxial crystalline to amorphous state as a function of Ni concentration is examined in Al(Ni) alloys formed by ion implantation and e-beam melt quenching. The evolution from epitaxial crystalline Al at $\lesssim$3.5 at.% Ni to amorphous phase formation at 15-30 at.% Ni is characterized in detail for 8, 10 and 12% Ni uniform concentration samples by ion channeling and transmission electron microscopy. The transition occurs via complete loss of epitaxial regrowth at 9 at.% and the formation of a fine-grained polycrystalline Al, with grain size decreasing with increasing Ni from 20-100 Å at 10% Ni concentration to $\lesssim$ $\lesssim$0-50 Å at 12% Ni. (8 refs.)

107771 Paraelasticity in electron-irradiated molybdenum. B.Beuneu, Y.Quere (SESI, CEN, Fontenay-aux-Roses, France).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.156-8
The relaxation of a radiation-induced point defect—most probably the rotation of a $\langle 110 \rangle$ dumbbell—is observed during isothermal anneals of irradiated molybdenum, by resistivity measurements. The recovery of close pairs is not affected, in first analysis, by the presence of a uniaxial stress. (14 refs.)

107772 The low temperature recovery in electron-irradiated BCC transition metals. H.Kugler, I.A.Schwirtlich (Inst. fur Phys., Max-Planck-Inst. fur Metall., Stuttgart, Germany), S.Takaki, U.Ziebart, H.Schultz.
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.191-4
New results are reported on the isochronal recovery of the electrical resistivity of ultra-high-purity Mo, Fe, Nb, and Ta following low temperature electron irradiation. (10 refs.)

107773 Stage III recovery in electron-irradiated BCC transition metals. H.Kugler, I.A.Schwirtlich (Inst. fur Theoretische und Angewandte Phys., Univ. Stuttgart, Stuttgart, Germany), S.Takaki, K.Yamakawa, U.Ziebart, J.Petzold, H.Schultz.
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.520-2
New results are reported on ultra-high purity and impurity doped materials. Characteristic impurity influences on stage III are observed, due to metallic solute atoms, impurity interstitials as C, O, N, and by H solute atoms. (13 refs.)

107774 Effect of irradiation on the parameters of neutron-transmutation-doped silicon. L.S.Berman, I.N.Voronov, I.V.Grekhov, P.M.Grinshtein, M.A.Morokhovets, A.D.Remenyuk (A.F. Ioffe Physicotech. Inst., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.8, p.1052-6 (Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.8, p.1249-52 (Aug. 1982).
Reduction of the fast neutron component in the neutron flux allows higher parameters to be obtained for neutron-transmutation-doped (NTD) silicon (smaller spread in ρ, higher values of τ, lack of deep centres with a complex energy spectrum, more perfect structure). Differences in the spectra are observed for samples of neutron-transmutation-doped silicon obtained under various irradiation conditions when the samples are subjected to heat treatment at 1170K. High-temperature heat treatment during preparation of diode structures ensures complete annealing of radiation defects, but causes the appearance of new deep centres. (13 refs.)

107775 Effects of 14 MeV neutron irradiation on creep of nickel and niobium. W.Barmore, A.Ruotola, E.Raymond (Materials Sci. Div., Lawrence Livermore Nat. Lab., Livermore, CA, USA), A.Mukherjee.
J. Nucl. Mater. (Netherlands), vol.117, p.258-63 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
Flux, stress and temperature effects on the creep strength of nickel and niobium were observed in situ at the RTNS-II 14 MeV neutron source at Lawrence Livermore National Laboratory. Creep tests were done on Ni and Nb near 0.3 T_m with stresses to 280 MPa in a high vacuum test unit using a digital computer for control and data acquisition. Cyclic flux tests produced dramatic changes in creep rate. This creep behaviour is attributed to the point defect fluctuations in the crystal structure. Analysis of creep and stress relaxation under steady state flux indicates that an intermediate temperature, thermally activated deformation mechanism is rate controlling. (16 refs.)

107776 Crack propagation characteristics in neutron irradiated type 316 stainless steel microspecimens. R.D.Gerke, W.A.Jesser (Dept. of Materials Sci., Univ. of Virginia, Charlottesville, VA, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.320-6 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
In order to better relate the macroscopic mechanical behaviour of irradiated alloys to their associated microstructural condition, unirradiated and neutron irradiated microspecimens were tensile tested at 25-600°C in a quantitative load elongation stage while under continuous observation in a high voltage electron microscope (HVEM). The microtensile specimens, 40 μm thick, of type 316 stainless steel were irradiated at ambient temperature to a fluence of 1×10^{22} n/m^2 with 14 MeV neutrons in the Lawrence Livermore Rotating Target Neutron Source II (RTNS) facility. Crack angles, directions and length plotted against total specimen elongation were used to describe the manner in which a crack progressed through each specimen. Rapid crack propagation is accompanied by rapidly changing crack angles and direction and conversely slow propagation corresponds to slowly changing variables. A graph of cumulative crack length plotted against total elongation exhibits a slope which increases as specimen ductility decreases. This graph reflects changes due to the effect of neutron irradiation. (11 refs.)

107777 Mechanical, thermal, and microstructural properties of neutron-irradiated SiC. J.C.Corelli, J.Hoole, J.Lazzaro, C.W.Lee (Dept. of Nuclear Engng., Rensselaer Polytech. Inst., Troy, NY, USA).
J. Am. Ceram. Soc. (USA), vol.66, no.7, p.529-37 (July 1983).
The thermal and electrical conductivities, fracture strength, swelling, and microstructure of sintered alpha-phase SiC and siliconized reaction-bonded SiC materials were studied before and after irradiation with reactor neutrons. The effects of helium gas on the properties were studied using boron enriched in ^{10}B to produce helium from ^{10}B(n, α)^{7}Li. The decrease in thermal conductivity after irradiation is due to enhanced phonon scattering by radiation-induced defects. Electrical, mechanical, and thermal properties exhibit partia recovery after heat treatment to 1000 to 1500K. An overall consistency is observed in radiation-produced property changes and annealing and a mode is presented to explain the changes. (28 refs.)

107778 A two-function α-particle model for radiation damage caused by 14-MeV neutrons. I.Yu.Abdrashitov, S.P.Vagin, V.F.Reutov, A.V.Yushkov R.R.Yanke (Inst. of Nuclear Phys., Acad. of Sci., Alma-Ata, Kazakh SSR).
Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.226-30 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.369-76 (Feb. 1983). [received Sept. 1983]
It is shown by comparing radiation damage in terms of two critical correlation functions, the primary ejected atom (PEA) energy spectrum and th nuclear reaction product (NRP) mass spectrum, that damage to structura materials caused by 14-MeV neutrons can be stimulated using α particles o energy between 20 and 30 MeV. Alpha particles are much more efficient i

producing radiation-induced defects than the 17-MeV protons usually used to simulate neutron-induced damage. Findings from an experimental investigation of correlations in damage to molybdenum caused by 17-MeV protons and 28-MeV α particles are reported. (28 refs.)

107779 Recovery of lattice spacing in HCP metals after fast-neutron irradiation at 5K. H.Maeta (Div. of Phys., JAERI, Ibaraki, Japan).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.149-52
Recovery of the c-axis and a-axis spacing in Cd, Zn, and Mg after fast neutron irradiation at 5K was measured in the range from 5 to 300K by the X-ray diffraction method. The ratio of a fractional change of the c-axis spacing to that of the a-axis spacing by fast-neutron irradiation, $(\Delta c/c_0)/(\Delta a/a_0)$, was found to be 3.4 for Cd, 2.1 for Zn and -0.3 for Mg, respectively. Recovery mechanisms of defects in HCP metals are discussed. (10 refs.)

107780 Effect of beam energy and anneal history on trivalently bonded silicon defect centers induced by ion beam etching. R.Singh, S.J.Fonash (Engng. Sci. Program, Pennsylvania State Univ., University Park, PA, USA), P.J.Caplan, E.H.Poindexter.
Appl. Phys. Lett. (USA), vol.43, no.5, p.502-4 (1 Sept. 1983).
Ion beam etching produces a modified layer at the surface of silicon which subsequently affects the electrical characteristics of devices fabricated on these surfaces. In this investigation it is shown that the modified layer resulting from low-energy ion beam processing contains a fundamental defect which has the signature of a trivalently bonded, silicon defect center. The evolution of the signature of this defect with ion beam energy and anneal history correlates with the evolution of the current-voltage characteristics of metal contacts made to the modified layer. (11 refs.)

107781 Depth profiling of helium irradiation damage in niobium. I.Nashiyama, T.Nishijima.
Bull. Electrotech. Lab. (Japan), vol.47, no.6, p.433-40 (1983). In Japanese.
A depth damage profile is measured by ⟨111⟩ and ⟨110⟩ axial proton channeling backscattering with incident energy of 0.8, 1.0 and 1.3 MeV at room temperature. Irradiation damages are introduced by 0.8 MeV helium ion bombardment with a fluence of 4.42×10^{17} ions/cm^2. An almost flat damage profile with a slight peak at its edge is observed to extend within the whole penetration area of helium implants. This profile differs remarkably from a theoretical damage-introduction profile given by Brice (1975), suggesting strong migration of primary defects towards the specimen surface. An anisotropy of the damage is found: damage concentrations measured by ⟨111⟩ axial channeling are almost twice as high as those measured by ⟨110⟩ channeling. (18 refs.)

107782 First stage of agglomeration or irradiated helium in refractory metals. N.Kobayashi.
Bull. Electrotech. Lab. (Japan), vol.47, no.6, p.469-78 (1983). In Japanese.
Thermal desorption spectrometry has been applied to the study of the agglomeration of irradiated helium in refractory metals—vanadium, niobium, molybdenum and tungsten. After single crystals are irradiated with 100 keV helium ions with fluences of 2×10^{13} to 2×10^{15} ions/cm^2 at room temperature, thermal desorption spectra and absolute partial pressure of reemitted helium are measured with a calibrated quadrupole mass filter. Values of helium dissociation energy are calculated by a computer-simulation method in the case of vanadium. Using the values of dissociation energy, desorption peaks are assigned to the trapped modes of irradiated helium. (29 refs.)

107783 Surface damage and crystallization in amorphous alloys by helium ion bombardment. N.Hayashi, T.Takahashi, I.Sakamoto, H.Sekiguchi.
Bull. Electrotech. Lab. (Japan), vol.47, no.6, p.479-88 (1983). In Japanese.
The effects of 40 keV helium ion irradiation on amorphous alloys and stainless steel have been studied by topographical examination of their surface with a scanning electron microscope and measurement of the surface magnetism by conversion electron Mossbauer spectroscopy. In amorphous alloy $Fe_{40}Ni_{40}P_{14}B_6$ surface blistering is observed after irradiation at ~400°C with a total dose of 1×10^{18} ions/cm^2. The surface damages are found to be associated with a crystallization in the alloy. Mossbauer spectra taken from the damaged region reveal the existence of paramagnetic phases and ferromagnetic phases with small internal fields. The surface damage is not observed for amorphous alloy $Fe_{80}B_{20}$ irradiated with 40 keV helium ions to a dose of 3×10^{18} ions/cm^2. The Mossbauer spectra, on the other hand, show that α-iron phases appear in the near surface region without formation of crystalline iron borides. The critical dose for the crystallization is 5×10^{17} ions/cm^2. Results of investigation into ferromagnetic layer formation on the surface of type 304 stainless steel irradiated with helium ions are also given. Magnetically split peaks are detected in the Mossbauer spectrum of the bombarded surface. (35 refs.)

107784 Surface damage of Cu/Ni alloys by low energy noble gas ion bombardment. H.Shimizu, M.Ono, K.Nakayama.
Bull. Electrotech. Lab. (Japan), vol.47, no.6, p.505-24 (1983). In Japanese.
Compositional changes of the surface and near-surface layers in Cu/Ni alloys during noble gas ion bombardment from room temperature to 873K have been studied by means of microprobe Auger spectroscopy (μ-AES), X-ray microanalysis (XMA) and scanning electron microscopy (SEM). After sputtering at room temperature, the surface is enriched with nickel by the selective sputtering of copper. With the increase in the specimen temperature sputtering at a high dose rate results in further nickel enrichment. On the other hand copper segregation is observed at a low dose rate. A long range depletion of copper in the order of 100 nm in thickness is observed depending on the sputtering time, specimen temperature and ion beam density. From the depth profile of the copper depleted region, the enhanced diffusion coefficients of copper in the ion-damaged layer are measured. The apparent activation energy calculated, assuming an Arrhenius type equation, is 5 to 6 kcal/mol. It is suggested that an interstitial type diffusion mechanism is predominant in the damage layer. The depletion of copper is of the order of a few μm along the grain boundary for the sputtering at 873K. (64 refs.)

107785 The development of surface morphological features on crystalline materials by 30 keV Ar$^+$ ion bombardment. D.Ghose, D.Basu, S.B.Karmohapatro (Saha Inst. of Nuclear Phys., Calcutta, India).
Indian J. Phys. Part B, vol.57B, no.2, p.133-48 (April 1983). [received: Sept. 1983]
The development of conical protrusions, a frequently appearing phenomenon in sputtering experiments, is studied on Cu, Ni and Ag metals as a function of ion dose and crystal orientation. The results are discussed in the light of different physical mechanisms proposed for their formation. (28 refs.)

107786 Void formation and solute segregation in ion-irradiated niobium-base alloys. B.A.Loomis, S.B.Gerber (Materials Sci. & Technol. Div., Argonne Nat. Lab., Argonne, IL, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.224-33 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
The void-volume fraction is in unalloyed Nb and Nb-base binary alloys containing either ~2.4 a/o Mo,Ti,Zr,Hf,Ni,Fe,V or Ta has been determined from observations of specimens by transmission electron microscopy following 3.0-MeV $^{58}Ni^+$ ion irradiation at 1225K to ~50 d.p.a. Also, the thermal- and irradiation-induced segregation of these substitutional-atom solutes to the specimen surface and within the irradiation-damaged layer have been determined by us of the Auger Electron Spectroscopy technique. In addition, the segregation of the intrinsic, interstitial-O impurity (~0.06 a/o) in these irradiated or annealed materials has been determined. The void-volume fraction and the segregation of solutes have been shown to be correlated by the solute diffusivity and the relative chemical affinity of the substitutional solutes for O. The correlated diffusion of vacancy defects and O atoms is postulated to explain the experimental results. (30 refs.)

107787 Effect of microstructure on light ion irradiation creep in nickel. C.H.Henager,Jr., E.P.Simonen, E.R.Bradley (Pacific Northwest Lab., Richland, WA, USA), R.G.Stang.
J. Nucl. Mater. (Netherlands), vol.117, p.250-7 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
The concept of inhomogeneous slip or localized deformation is introduced to account for a weak dependence of irradiation creep on initial microstructure. Specimens of pure nickel (Ni) with three different microstructures were irradiated at 473K with 15-17 MeV deuterons in the Pacific Northwest Laboratory (PNL) light ion irradiation creep apparatus. A dispersed barrier model for climb-glide (CG) creep was unable to account for the observed creep rates and creep strains. The weak dependence on microstructure was consistent with the stress induced preferential absorption (SIPA) creep mechanism but a high stress enhanced bias had to be assumed to account for the creep rates. Also, SIPA was unable to account for the observed creep strains. The CG and SIPA modeling utilized rate theory calculations of point defect fluxes and transmission electron microscopy for sink sizes and densities. (23 refs.)

107788 Pulsed proton beam annealing of Co-Si thin film systems. L.J.Chen (Dept. of Materials Sci. & Engng., Nat. Tsing Univ., Hsinchu, Taiwan), L.S.Hung, J.W.Mayer, J.E.E.Baglin.
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.709-14
Cobalt (~300 Å) and $CoSi_2$ (~1000 Å) thin films on Si have been annealed by intense proton beams. RBS and TEM are performed to study ion beam annealing effects. For ion beam energy densities above about 1 J/cm^2, epitaxial $CoSi_2$ layers were formed for both Co and polycrystalline $CoSi_2$ on Si. At low energy densities, Co_2Si was found to coexist with Co. The results are discussed in terms of eutectic melting processes. (7 refs.)

107789 Pulsed ion beam interface melting of PtCr and CrTa alloys on Si structures. C.J.Palmstrom, R.Fastow (Dept. of Materials Sci. & Engng., Cornell Univ., Ithaca, NY, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.715-20
Composition profiles of thermal and pulsed ion beam annealed PtCr/Si and CrTa/Si have been determined using Rutherford backscattering analysis. Thermal annealing resulted in layered phase separation with Pt-silicide in the PtCr/Si case, and $CrSi_2$ in the CrTa/Si case, forming at the Si surface. Pulsed ion beam annealing, 300-380 keV protons at energy densities ~0.75-1.6 J/cm^2, produced interface melting with no layered phase separation. (16 refs.)

107790 Dechanneling anomalies of high-energy ions at the charge-density-wave transition in 1*T*-TaS$_2$. T.Haga, Y.Abe (Dept. of Nuclear Engng., Hokkaido Univ., Sapporo, Japan), Y.Okwamoto.
Phys. Rev. Lett. (USA), vol.51, no.8, p.678-81 (22 Aug. 1983).
Backscattering yields of 1.00-MeV He$^+$ ions on 1*T*-TaS$_2$ are reported from room temperature to 120K. The temperature dependence of the backscattering yield exhibits the softening of an acoustic mode and an optical mode. An anomalously large peak in the backscattering yield with large hysteresis was observed around the nearly commensurate to commensurate transition temperature, indicating existence of a disordered state. A small peak around 280K was observed on heating, indicating existence of a new transition in this material. (12 refs.)

107791 Radiation at planar channeling of relativistic electrons in thick crystals. V.N.Baier, V.M.Katkov, V.M.Strakhovenko (Inst. of Nuclear Phys., Novosibirsk, USSR).
Phys. Status Solidi b (Germany), vol.118, no.2, p.499-509 (1 Aug. 1983).
The distribution kinetics with respect to the transverse energy at electron channeling is discussed. The asymptotic expressions for the radiation intensity into a given collimator at electron channeling in thick crystals are derived. An optimal thickness at which the radiation output is maximal is found. The spectral distribution of the radiation intensity is analysed for the case of a single diamond crystal. (10 refs.)

107792 Position-dependent stopping power for channeled ions. O.H.Crawford, C.W.Nestor,Jr. (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1260-6 (Sept. 1983).
A method is developed for predicting the stopping power of crystals toward swift channeled ions, based on a semiempirical treatment of the dielectric response of the medium. Random stopping power is also obtained. Theoretical results are compared with the experimental channeled stopping power of gold as a function of ion velocity and position within channels. It is shown that the theory is accurate when the velocity of the ion equals at least twice the root-mean-square velocity (estimated from binding energies) of most of the electrons near its path. (30 refs.)

107793 Ion channeling investigations of the interactions between irradiation-produced defects and solute atoms in metals. L.M.Howe (Chalk River Nuclear Labs., AECL Res. Co., Chalk River, Ontario, Canada).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.53-8
Ion channelling investigations in various metals have shown that small solute atoms trap self-interstitial atoms to form the mixed dumbbell configuration, in which a solute atom and a host atom straddle a lattice site. Recent data are presented concerning the production of mixed dumbbells and the nature of the trapping configurations resulting from irradiation of dilute Al alloys with He and Kr ions. The channeling technique is also now providing information on the trapping of vacancies by solute atoms. The growth of trivacancy-solute atom, tetravacancy-solute atom and hexavacancy-solute atom complexes caused by vacancy trapping at large solute atoms in the FCC metals Al and Cu during annealing in stage III following low temperature irradiations is discussed and evidence is presented for trapping of vacancies at large solute atoms in BCC Fe. 107794 Viscoelastic properties of liquid pentachlorobiphenyl under pressure using depolarized light scattering. P.Bezot, C.Hesse-Bezot (Lab. de Phys. de la Matiere Condensee, Univ. de Nice, Nice, France), P.Pruzan.
Can. J. Phys. (Canada), vol.61, no.9, p.1291-6 (Sept. 1983).
A study of the depolarized light scattering spectra of high pressure supercooled pentachlorobiphenyl is presented. From the analysis of the propagative shear doublet, the infinite shear modulus G_∞ is measured over a large pressure range, at various temperatures, up to a pressure where the liquid is in a glassy state. $G_\infty(P)$ is found to vary linearly at each temperature. From values of G_∞ (P=0.1 MPa) together with those obtained in a previous paper at P=0.1 MPa as a function of T, it is concluded that $G_\infty(T)$ is linear over 70°C, contrary to what is generally obtained in most of the supercooled molecular liquids. (15 refs.)

107795 Density and viscosity of melts in the system Pb-Sn-Te and critical rates of growing Pb$_{1-x}$Sn$_x$Te single crystals by the Czochralski method. V.F.Mikhailov, A.M.Sokolov, E.B.Sokolov, O.V.Pelevin (Moscow Inst. of Electronic Engng., Moscow, USSR).
Inorg. Mater. (USA), vol.18, no.8, p.1078-80 (Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.8, p.1278-80 (Aug. 1982).
The viscosity and density of liquid solutions have been determined in the system Pb-PbTe-SnTe-Sn with solidus isoconcentrates for Pb$_{1-x}$Sn$_x$Te (x=0.20) single crystals. Diffusion coefficients and the thickness of the diffusion layer have been calculated for the melt compositions investigated. The critical growth rates of Pb$_{1-x}$Sn$_x$Te single crystals have been calculated for the whole range in which solid solutions exist, as well as of Pb$_{0.8}$Sn$_{0.2}$Te single crystals grown from solution and melts in the Pb-PbTe-SnTe-Sn system for certain temperature gradients. (8 refs.)

The constant volume piezometer method is used to obtain P, ρ, T data for propanol-1 at temperatures of 150-370K and pressures of 0.1-80 MPa. (5 refs.)

107797 Model of elastic deformation in describing the stretching of polymer solutions. A.N.Prokunin (Inst. of Problems of Mech., Acad. of Sci., Moscow, USSR).
J. Eng. Phys. (USA), vol.44, no.1, p.35-41 (Jan. 1983). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.44, no.1, p.44-51 (Jan. 1983). [received: Sept. 1983]
The tension of solutions in the case of large elastic strains can be described by means of rheological equations for cross-linked rubber. (9 refs.)

107798 Determination of the first and second normal stress differences in the truncated-cone-and-plate apparatus. I. Measurements on a polyisobutylene/decalin solution. G.A.Alvarez, A.S.Lodge, H.-J.Cantow (Inst. fur Makromolekulare Chem., Univ. Freiburg, Freiburg, Germany).
Polym. Bull. (Germany), vol.10, no.5-6, p.256-63 (Aug. 1983).
The steady state radial pressure distribution in the truncated cone-and-plate (TCP) apparatus has been measured for a highly elastic polyisobutylene solution in cis-trans decalin (M_W=4300 kgmol^{-1} M_W/M_n=2) at eight shear rates from 1 to 270 s^{-1} and temperatures of 3.0, 20.0, 30.0 and 46.0°C. The slope of pressure, corrected for inertia by the classical formula, versus the logarithm of radius provides a combination of normal stress differences N_1+2N_2 with a typical experimental scatter of 1% at all measured temperatures and shear rates. The plots of N_1+2N_2 versus shear rate can be shifted, without loss of accuracy, by means of the time-temperature superposition principle, the shift factors strictly adhering to a WLF equation. Extrapolated rim pressures, when corrected for elastic hole pressure with a theoretical equation, give values to the second normal stress difference with typically less than 10% of experimental scatter. Contrary to previous analyses of the TCP apparatus, the center-hole pressure is found to give a useful estimate of the second normal stress difference, although there are insufficient data at present to perform the differentiation of a nonlinear function required in the analysis of the data. (9 refs.)

107799 Elastic deformation of nematic liquid-crystal media. A.N.Bulygin, L.G.Shaltyko.
Sov. Phys.-Crystallogr. (USA), vol.28, no.2, p.240-2 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.405-8 (March-April 1983). [received: Sept. 1983]
In a magnetic field H, elastic deformations of nematic liquid crystals (NLC) are realized: 'twist', and longitudinal and transverse 'bend'. The initial orientations of a uniformly oriented NLC are planar and homeotropic; a measure of the deformation is the angle of rotation of the axes of anisotropy ϕ. The dependence of ϕ on z and H is found from the equations of the continuum theory. The authors' aim was to find and investigate the exact solutions of these equations. (2 refs.)

62.20 MECHANICAL PROPERTIES OF SOLIDS (RELATED TO MICROSCOPIC STRUCTURE)

(see also 81.40 Treatment of materials and its effects on microstructures and properties, 81.70 Materials testing)

107800 Statistical evaluation of the mechanical strength of insulators. V.Cerny, J.Chmelicek.
Energetika (Czechoslovakia), vol.33, no.6, p.247-9 (June 1983). In Czech.
The author presents statistical evaluation data of Spirelec insulators, gathered over a period from 1977 to 1982. The type L 100 BH 550 insulator is characterised by a spiral-shaped hood and internal cementing. During piece tests, these insulators are subjected to stressing by 100 kN for 1 minute, this being the nominal tensile strength of the insulator. The test led to the scrapping of a considerable number of insulators. After complete assessment by means of Weibulls' division, a new test value in the range below 100 kN was estimated on the basis of the earlier measurements. Suitability of employing the described statistical method for assessing acceptance of type L 100 BH 550 insulators was thus verified. (5 refs.)

107801 Restoration of components of diesel-electric locomotives. V.A.Babenko, V.A.Vetrennikova, A.P.Nefedov.
Elektr. & Teplovoznaya Tyaga (USSR), no.5, p.26-8 (May 1983). In Russian.
Restoration of worn components of diesel-electric locomotives by building up by the electrolytic deposition of iron is a process widely used in the USSR. The cathode is the workpiece, the anode is a rod or disc of low-carbon steel and a hot chloride electrolyte is used. Details of the process and the mechanical properties (micro-hardness, wear resistance, porosity, etc.) of the built-up layer are given. (no refs.) *H.E.G.*

62.20D Elastic constants

(see also 03.40D Mathematical theory of elasticity, 81.40J Elasticity and anelasticity)

107802 Static and dynamical elastic behaviour of squaric acid around its phase transition. W.Rehwald, A.Vonlanthen (Labs. RCA Ltd., Zurich, Switzerland).
Z. Phys. B (Germany), vol.52, no.2, p.139-44 (1983).
Ultrasonic velocity measurements could be performed on a good quality single crystal of squaric acid close to its transition temperature around 373K. The behaviour of the stiffness components c_{33} and c_{44} clearly demonstrates a first-order transition. The temperature variation of c_{11} and c_{66} can be fitted to a formula obtained from the Landau theory and assuming a strictive-type coupling between order parameter and strain. From attenuation measurements characteristic times for the order-parameter dynamics can be estimated, ranging from 10^{-11} to several 10^{-10} s in a temperature range of about 12K on either side of the transition. (21 refs.)

107803 A simple method for determining of the elastic coefficient A_{11}-$2A_{21}>0$ of smectic C liquid crystals. H.P.Hinov (Inst. of Solid State Phys., Bulgarian Acad. of Sci., Sofia, Bulgaria).
C.R. Acad. Bulg. Sci. (Bulgaria), vol.36, no.5, p.611-14 (1983).
Although some have dealt with a possible Freedericksz transition in a Sm*C*LC the experiments, performed in this direction, are very rare and up to now they give only the value of the characteristic tilt and its temperature dependence. No information has been given about the possible values of the elastic Sm*C* coefficients entering in the elastic energy expression. The measurement of the elastic coefficients A_{11}, A_{12} and A_{21}, related to the curvature of the Sm*C* layers, is more complicated since the utilization of electric or magnetic fields cannot ensure the eventual determination of these coefficients due to the very weak non-observable deformation of the Sm*C* planes. Another useful way for determining of these coefficients is connected with a measurement of the periodicity of Sm*C* layer undulations, investigated for the first time by Johnson and Saupe (1977) and by other authors. However, these measurements cannot give the difference between the elastic coefficients A_{11} and A_{21}. The aim of the communication is to propose a simple method for possible measurements of the difference between the elastic coefficients A_{11} and $2A_{21}$ when $A_{12}-A_{21}>0$. (10 refs.)

107804 Elastic constants of GaS and GaSe layered crystals determined by Brillouin scattering. Y.Honma, M.Yamada, K.Yamamoto, K.Abe (Dept. of Electronics, Kobe Univ., Kobe, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2777-83 (Aug. 1983).
The five independent elastic constants of GaS and GaSe have been precisely determined at room temperature from high-resolution Brillouin spectra in various scattering geometries. The results are: $c_{11}=12.16$, $c_{12}=3.52$, $c_{13}=1.14$, $c_{33}=3.79$, $c_{44}=0.95$, $c_{66}={}^1/_2(c_{11}-c_{12})=4.30$ for GaS, and $c_{11}=10.50$, $c_{12}=2.97$, $c_{13}=1.22$, $c_{33}=3.51$, $c_{44}=1.00$, $c_{66}={}^1/_2(c_{11}-c_{12})$ for GaSe, in units of 10^{10} Nm^{-2}. The authors found a relatively low elastic anisotropy, associating with the layered structure of GaS and GaSe crystals. (16 refs.)

107805 The elastic properties of some phosphate/vanadate glasses. C.F.Drake (Standard Telecommunications Labs. Ltd., Harlow, England), B.W.James, H.Kheyrandish, B.Yates.
J. Non-Cryst. Solids (Netherlands), vol.57, no.2, p.305-25 (1 Sept. 1983).
The elastic constants of 7 phosphate/vanadate glasses, containing TiO_2, Na_2O and a range of concentrations of CuO, have been measured from 4.2 to 300K. The pressure variation of the elastic constants has also been measured and has been used to calculate the low temperature value of the Gruneisen parameter γ_0 for these glasses. Analysis of the results and other data has been used to show how TiO_2, Na_2O and CuO may be incorporated in the structure of these P_2O_5/V_2O_5 glasses. (42 refs.)

107806 Compression effect on the bulk modulus of Al. T.Soma, Y.Konno, H.-M.Kagaya (Dept. of Appl. Phys. & Maths., Mining Coll., Akita Univ., Akita, Japan).
Phys. Status Solidi b (Germany), vol.118, no.2, p.K155-7 (1 Aug. 1983).
The local Heine-Abarenkov model potential of Al with volume-dependent parameters is applied to the calculation of bulk modulus and the compression effect on the bulk modulus of Al. The bulk modulus B is obtained from the second derivative of the crystal energy E with respect to the crystal volume Ω as $B=\Omega d^2E/d\Omega^2$. (3 refs.)

107807 Dependence of the elastic constants of zinc sulfide on the wurtzite/sphalerite phase composition. S.Yu.Davydov, I.B.Kobyakov (A.V. Shubnikov Inst. of Crystallography, Acad. of Sci., Moscow, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.231-2 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.377-9 (Feb. 1983). [received: Sept. 1983]
Many compounds crystallize with two or more polymorphic crystal structures. In particular, zinc sulfide (ZnS) crystallizes to give sphalerite (T_d) and wurtzite (C_{6V}) crystal structures, with the wurtzite structure being metastable under ordinary conditions. Both crystal modifications consist of the same type of structural units (tetrahedra), so that their lattice sites have identical environments up to and including the second-nearest neighbors (the authors take wurtzite to have the ideal structure with $c/a=1.633$). However, in the sphalerite all the tetrahedra have the same orientation, whereas in wurtzite two orientations differing by a 60° rotation are possible. The tensors describing the various physical properties of these structures also depend on the rotation angle. (8 refs.)

107808 Moduli of elasticity and stability of strongly anisotropic crystal with vacancies. D.M.Bercha, M.I.Maryan.
Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1221-6 (Aug. 1983). In Russian.
The stability conditions of a strongly anisotropic crystal with vacancies at high temperatures in the pseudoharmonic approximation of self-consistent phonons are considered for a simple hexagonal lattice of layer structure with allowance for central and non-central interactions between the neighbouring atoms. It is shown that formation of vacancies leads to a decrease in the temperature instability of the layered crystal corresponding to rupture of the weak interlayer forces. (9 refs.)

62.20F Deformation and plasticity

(inc. yield, ductility and superplasticity; see also 81.40L Deformation, plasticity and creep)

107809 Mesoscopic and microscopic aspects of the PSB formation mechanism in fatigued FCC monocrystals. C.Blochwitz, H.-J.Burmeister, U.Kremling (Sektion Phys., Padagogische Hochschule Dresden, Dresden, Germany).
Cryst. Res. & Technol. (Germany), vol.18, no.7, p.859-72 (1983).
Persistent zones of plastic strain localisation (PSBs) can be observed in fatigued FCC monocrystals above the 'nucleation cycle number' N_n and the 'nucleation stress' amplitude τ_n, respectively. They follow after temporary strain localisations existing at $N<N_n$ and being discernible by oscillations of the relative shape of the hysteresis loops (V_H) or by strain bursts. Using a simple rheological model the frequency of internal stresses of mesoscopic wave length ('mesoscopic stresses') was determined for Ni monocrystals fatigued at four different plastic strain amplitudes up to N_n. A 'mesoscopic threshold stress' τ^* has been found to be exceeded within the whole volume of the dislocation-dense regions (DRs) at $N \geq N_n$. By comparison of τ^* with the stress for the operation of Frank-Read sources of the segment lengths l_0 at the border of the DRs, it might be assumed that above N_n and τ_n respectively a mechanism of dislocation sources acts, compensating the high annihilation rate of moveable dislocations in the zones of strain localisation. In so doing the formation of persistent zones of strain localisation becomes possible, in which the 'ladder-like' dislocation structure of the final PSBs develops successively. (20 refs.)

107810 Theory for saturation stress difference in torsion versus other types of deformation at low temperatures. J.Weertman, S.S.Hecker (Center for Materials Sci., Los Alamos Nat. Lab., Los Alamos, NM, USA).
Mech. Mater. (Netherlands), vol.2, no.2, p.89-101 (Aug. 1983).
Torsion tests carried out to large plastic strains typically exhibit a leveling out (saturation) of the flow stress. On the other hand, saturation is usually not observed for other modes of deformation such as wire drawing or rolling. In iron and other body-centered cubic materials linear hardening persists to strains of ≈ 10. For face-centered cubic materials the behavior is mixed, with saturation not being achieved for most impure metals. The authors propose an explanation for the difference in flow stress at large strains between torsion and other modes of deformation. The explanation is based on Holt's dislocation cell wall formation theory and on the fact that apparently dislocations of only one Burgers vector are required to be active in torsion at large strains, whereas several are required for other deformation modes. Consequently, at the same dislocation density and applied stress level dislocations of opposite character but of the same kind are closer together in torsion. The dislocations have a stronger force of attraction between them and a faster rate of mutual annihilation through pipe diffusion controlled climb. The saturation stress is larger the larger is the number of different Burgers vectors of the dislocations involved in the deformation. Shear band instabilities are explained as a conse-

quence of material locally reducing the number of active slip systems. (35 refs.)

107811 Comments on 'Mechanical strengthening and impurity precipitation behaviour for divalent cation-doped alkali halides'. G.Berg, P.Grau, F.Frohlich.
J. Mater. Sci. (GB), vol.18, no.9, p.2844-5 (Sept. 1983).
Comments are made on a paper by Zaldo et al. (see ibid., vol.17, p.1465, 1982) reporting the influence of the clustering of divalent metal impurity-cation vacancy dipoles on the critical yield stress of alkali halide crystals. The present authors have examined measurements by other workers. These agree with the experimental results of Zaldo et al., but differences exist with respect to their interpretation, originating especially from the information of other simultaneously applied methods used in addition to the mechanical one. (no refs.)

107812 The surface dislocation and its relationship to the boundary-integral equation. M.J.Marcinkowski (Dept. of Mech. Engng., Univ. of Maryland, College Park, MD, USA).
Phys. Status Solidi a (Germany), vol.78, no.2, p.401-14 (16 Aug. 1983).
The classic Somigliana identity allows the deformation within a body to be uniquely determined if the surface tractions or displacements associated with that body are prescribed. The physics associated with this method are described in detail, and it is shown that the Somigliana approach is equivalent to the surface dislocation approach. The method of surface dislocations, however, allows for greater physical insight, as well as a more straightforward numerical solution to complex problems involving the deformation of solids. 62.20H Creep

(see also 81.40L Deformation, plasticity and creep)

107813 Creep in transforming polycrystalline materials. M.S.Paterson (UER des Sci. Phys. de la Terre, Univ. Paris VII, Paris, France).
Mech. Mater. (Netherlands), vol.2, no.2, p.103-9 (Aug. 1983).
An extension, taking recovery into account, has been made of Poirier's (1982) theory of transformation plasticity, that is, the acceleration of creep due to the introduction of accommodation dislocations in the plastic relaxation of the misfit of domains of new phase formed during phase transformation. This enables more realistic distinctions to be made between situations where transformation plasticity may be a significant effect in the Earth and where it may not. (5 refs.)

107814 The role of grain boundaries in deformation and fracture at high temperatures. V.Sklenicka, I.Saxl, J.Cadek (CSAV, Brno, Czechoslovakia).
Kovove Mater. (Czechoslovakia), vol.21, no.4, p.364-82 (1983). In Czech.
Some experimental results are summarized demonstrating the role of grain boundaries and expecially the role of grain boundary sliding in deformation and fracture at high temperatures (i.e. homologous temperatures above about 0.4). Only the simplest case of deformation under invariable external conditions (stress, temperature) is considered i.e. creep under uniaxial load. The first part of the paper concerns the active role of grain boundary sliding in plastic deformation of metallic polycrystals. The second part concerns the role of grain boundaries in intergranular fracture. All the three stages of intergranular fracture—cavity nucleation, cavity growth and macroscopic crack growth are briefly discussed in relation to grain boundary sliding. Also the propagation of an a priori crack (the crack developed in the body prior to creep) is briefly discussed. (45 refs.)

107815 Creep of aluminium single crystals under high pressure. O.V.Presnyakova, V.I.Zaitsev, V.A.Fomchenko (Phys.-Tech. Inst., Acad. of Sci., Donetsk, Ukrainian SSR).
Phys. Status Solidi a (Germany), vol.78, no.2, p.377-83 (16 Aug. 1983).
A study of a high hydrostatic pressure effect on creep regularity and evolution of the dislocation structure in Al single crystals, oriented for single slip is carried out. It is found that the high pressure effect leads to an essential creep deceleration and to a quality change of a curve form to the sigmoidal one at $P \geq 750$ MPa. At $P=750$ MPa an essential decrease in density of slip lines and dislocations during the initial stage of a deformation process is observed. The results obtained are discussed using the Webster (1966) creep theory and explained by the higher pressure effect on the multiplication of mobile dislocations than on their environment. (12 refs.)

107816 Inverse primary creep. B.Burton (Berkeley Nuclear Labs., CEGB, Berkeley, England).
Philos. Mag. A (GB), vol.48, no.2, p.299-310 (Aug. 1983).
The transient behaviour which arises when the initial dislocation density is less than that which is to be achieved during subsequent steady-state creep is described in terms of the relative rates of creation and annihilation of dislocations. It is shown that the inverse primary creep of certain alloys in which the creep rate increases towards the steady value can be explained. The total inverse primary strain is shown to be proportional to the difference in the initial dislocation spacing and the equilibrium spacing at steady state, and also to the square of the stress. Predictions of the model are compared with reported results on the alloy Zircaloy 4. (4 refs.)

62.20M Fatigue, brittleness, fracture, and cracks

(inc. hardness; see also 81.40N Fatigue, embrittlement and fracture)

107817 Elastomer friction. M.Barquins (LCPC, CNRS, Paris, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.20, p.1567-70 (6 June 1983). In French.
It is shown that the energy dissipated by friction with Schallamach's waves is closely related to the propagation speed of these waves, and it can be interpreted in terms of peeling. (9 refs.)

107818 A proposed criterion for fatigue threshold dislocation substructure approach. J.P.Lucas (Sandia Nat. Lab., Albuquerque, NM, USA), W.W.Gerberich.
Fatigue Eng. Mater. & Struct. (GB), vol.6, no.3, p.271-80 (1983).
A model for fatigue threshold has been proposed based on the dislocation subgrain cell structure that evolves at the crack tip in steels during the fatigue deformation process. The stabilized subgrain cells that develop in the material act as impenetrable barriers to dislocations in slip band pile-ups that emanate from the fatigue crack tip. The blocking of these dislocations tends to limit crack growth that occurs by crack tip emission of dislocations, thereby leading ultimately to the fatigue threshold conditions. The grain size effect on threshold is deduced to be an indirect effect as it is proposed that the subgrain cell size is the controlling substructural parameter at the threshold stress intensity level. The subgrain cell size is shown to be proportional to the one-third power of the initial grain size. (26 refs.)

107819 On the theory of axial-symmetric ductile fracture. P.Stanek, J.Pokluda.
Kovove Mater. (Czechoslovakia), vol.21, no.4, p.383-96 (1983). In Czech.
The authors' previously introduced theory of plastic deformation kinetics in the instability region of the tensile test has shown the connection between macroscopic and microscopic parameters of the ductile fracture process. On this basis, undirect measurements of the mean microvoid growth characteristics of steels 12010, 14109 and 14331 containing carbide particles as the main void nucleators have been performed. The results of these measurements together with measurements of carbide size distribution have been applied to prove the fracture strain prediction possibilities of some void coalescence models. The best theoretical estimations of fracture strain were obtained using the Brown-Emburry model (1973). Satisfactory, slightly conservative results provide the percolation model submitted by the authors, while the application of McClintock's concept (1968) gives too high values of predicted fracture strain. (30 refs.)

107820 Steady state vacancy concentration around a plastic crack. K.Jagannadham (Dept. of Engng. Sci. & Mech., Tennessee Technol. Univ., Cookeville, TN, USA).
Metall. Trans. A (USA), vol.14A, no.8, p.1615-24 (Aug. 1983).
The vacancy chemical potential associated with the crack region and with the lattice dislocations representing the plastic zone are identified in terms of the energy of the dislocation configuration. In order to determine the steady state vacancy concentration, the configuration is considered as made up of several internal sources of stress. The diffusion equation under steady state is solved for a crystal containing each source of stress. Further, superposition of the concentration of vacancies around each source is used to determine the total concentration of vacancies for small scale deformation at the crack tip. On the other hand, for large scale deformation at the tip, matching boundary conditions are applied to determine the concentration in each region containing an internal source. Both the discrete dislocation and the single lattice dislocation representations of the crack are employed to determine the crack growth rate. The results are used to emphasize the influence of the plastic zone on the crack growth rate by vacancy diffusion mechanism. (20 refs.)

(see also 81.40P Friction, lubrication and wear)

107821 On prediction of wear coefficients in sliding wear. N.P.Suh, H.-C.Sin (MIT, Cambridge, MA, USA).
ASLE Trans. (USA), vol.26, no.3, p.360-6 (July 1983).
The wear rates and wear coefficients of metals are analytically predicted based on the delamination theory of wear when the wear rates are controlled by the subsurface crack propagation rate. The wear rate and the wear coefficient are predicted to be directly proportional to the depth of crack location and the crack growth rate. The numerical values of wear coefficients are obtained through finite element analysis of crack propagation in elastoplastic solids. The agreement between typical experimental results and theoretical prediction is excellent. (21 refs.)

107822 Water on ice; influence on friction. D.Slotfeldt-Ellingsen, L.Torgersen (Central Inst. for Industrial Res., Oslo, Norway).
J. Phys. D (GB), vol.16, no.9, p.1715-19 (14 Sept. 1983).
The dynamic friction between polyethylene and a mixture of crushed ice and small amounts of a very dilute solution of H_2SO_4 in water was measured at temperature from 0°C to -20°C. The liquid has only a moderate 'lubricating' effect which indicates that the generally low friction between polyethylene and ice and snow cannot be explained simply by a liquid or liquid-like layer on the ice. Larger amounts of liquid ($\geq 1\%$) lead to an increase in friction, due probably to viscous drag. Contrary to what is commonly stated, the increase in friction, which is observed as the temperature approaches 0°C, is not caused by viscous drag. (11 refs.)

107823 Thermoelastic wave generation by resistive heating in silicon. S.E.Deggendorf, R.M.White (Dept. of Electrical Engng. & Computer Sci., Univ. of California, Berkeley, CA, USA).
Appl. Phys. Lett. (USA), vol.43, no.4, p.350-1 (15 Aug. 1983).
Reports the piezoelectric detection and thermoelastic signals resulting from resistive heating within a diffused resistor and commercial packaged transistor. CW and pulse experiments at 5 V and 300 kHz, as well as 5-V 10-MHz mixing experiments, result in transducer outputs in the 25 μV-1 mV range. Theoretical values are in good agreement with experimental findings. (16 refs.)

62.40 ANELASTICITY, INTERNAL FRICTION, AND DAMPING

(see also 81.40J Elasticity and anelasticity)

107824 Anomalous amplitude-dependence effect observed in Al-0.5 wt.% Cu alloy when the internal friction is extremely low. Zhang Jin-xiu (Dept. of Phys., Zhongshan Univ., China), Pan Zheng-liang, Ge Ting-sui.
Acta Phys. Sin. (China), vol.32, no.4, p.530-3 (April 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)* [received: Sept. 1983]
Free decay curves of slightly cold-worked Al-0.5 wt.% Cu specimen aged at room temperature (20°C) for 24 hrs were determined by an automatic inverted torsion pendulum with computer control. A series of amplitude internal friction peaks were observed as the low excitation amplitude was increased successively even when the internal friction was very low. (7 refs.)

107825 Internal friction of alkaline-earth-iron-metaphosphate glasses. W.Chomka, D.Samatowicz (Inst. of Phys., Tech. Univ. of Gdansk, Gdansk, Poland).
J. Non-Cryst. Solids (Netherlands), vol.57, no.2, p.327-37 (1 Sept. 1983).
The internal frictions of Mg, Ca, Ba iron-metaphosphate glasses were studied from 120 to 700K using the low-frequency torsion pendulum technique. The internal friction as a function of temperature revealed two distinct peaks. The low-temperature peak was absent in glass without iron oxide. Its activation energy compared favourably with that for dielectric loss and DC conductivity in similar glasses. This suggests the same mechanism for all three processes, probably connected with electron transfer between iron ions of different valence. (14 refs.)

107826 Internal friction and point defects in ordered β Cu-Zn and β Cu-Zn-Al. A.Ghilarducci, M.Ahlers (Centro Atomico Bariloche, Bariloche, Argentina).
J. Phys. F (GB), vol.13, no.9, p.1757-71 (Sept. 1983).
The internal friction and the torsion modulus have been measured in an inverted torsion pendulum using quenched β Cu-Zn and β Cu-Zn-Al alloys. Peaks observed at −50°C for the B2 ordered alloys and at −15°C for the DO_3 ordered alloys have been associated with ⟨111⟩ nearest neighbour vacancy-Cu atom pairs. Peaks found at 100°C and 200°C have been interpreted as being due to next nearest neighbour Cu pairs on the Zn rich sublattice. From the results a vacancy formation energy of 52 kJ mol^{-1} is deduced. Comparisons with existing diffusion data are presented. (24 refs.)

107827 Internal friction peaks and structural relaxation on some electroless deposited amorphous alloys. E.Bonetti, E.Evangelista, A.Cavallini, C.Patuelli (Istituto di Fisica, Univ. di Bologna, Bologna, Italy).
Phys. Status Solidi a (Germany), vol.78, no.2, p.615-21 (16 Aug. 1983).
Internal friction and dynamic modulus measurements are carried out on amorphous electroless deposited Ni-B and Ni-P alloys with different metalloid concentration from room temperature up to the starting temperature of the crystallization processes. In this temperature range, characterized by 'structural relaxation', one or two anelastic peaks depending on the alloy composition are observed. The influence of annealing and quenching on these peaks is studied together with the evaluation of the activation energies and of the relaxation times. Some possible elementary mechanisms at the origin of these peaks are discussed, also in connection with models recently proposed to explain the nature of the anelastic and magnetic relaxation peaks observed by other authors, in the same temperature range, on different amorphous alloys obtained with other techniques. The correlation of the peaks observed with the structural relaxation processes is also examined. (19 refs.)

107828 Estimation of strain dipole tensor due to interstitials in hexagonal close packed metals. B.Purniah, S.Srinivasan, K.Krishan (Reactor Res. Centre, Kalpakkam, India).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.322-4
The strain dipole tensor is an important quantity for the study of anelastic relaxation due to point defects. The authors estimate this tensor, using the computer simulation technique, for small interstitials carbon, nitrogen and oxygen in HCP metals Zr and Hf. The polynomial host-host and host-impurity interatomic potentials have been evaluated using various experimentally measured physical quantities. Results for the octahedral position of the interstitial are presented. The formation energy and volume are also obtained along with the dipole tensor. (8 refs.)

62.50 HIGH-PRESSURE AND SHOCK-WAVE EFFECTS IN SOLIDS

107829 Analysis of plane elastic-plastic shock-waves from the fourth-order anharmonic theory. G.Perrin (Dept. de Math. et Informatique, Univ. de Rennes I, Rennes, France), M.Delannoy-Coutris.
Mech. Mater. (Netherlands), vol.2, no.2, p.139-53 (Aug. 1983).
A finite strain elastic-plastic formalism developed in the literature and a generalization of the Mie-Gruneisen equation for nonhydrostatic stresses are used to calculate Hugoniot states for macroscopically isotropic materials. The general form of the free energy function resulting from the fourth-order anharmonic theory can be combined with the Hugoniot law of conservation of energy to obtain temperature-stress-strain relations for the uniaxial shock loading. In the third-order approximation the parameters entering these relations may be found from ultrasonic data by means of a suitable averaging procedure. With the work-hardening model proposed, it is shown that the determination of the Hugoniot curve does not require a description of the shock structure. The theoretical Hugoniot stress-strain curve for copper and aluminium is calculated in the special case of ideal plasticity for stresses up to 150 kbar. A comparative study of the results with those derived from the hydrodynamic approximation is also made. (27 refs.)

107830 Phase transformation under intense shock pressure loading. D.E.Grady (Sandia Nat. Labs., Albuquerque, NM, USA).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.377-81
Solids subjected to high velocity impact or explosive loading may undergo polymorphic phase transformation or melting within time periods appreciably less than 10^{-8} s due to the intense shock-pressure evironment. Although criteria for equilibrium phase transformation on the Hugoniot are satisfied, other nonequilibrium features unique to the shock-wave environment have been identified in the shock transformation process. These features include shear and heterogeneous deformation effects which control the transformation kinetics and microstructure of the transformed material. Transformation under shock loading leads to unusual microstructure in the recovered materials and can result in interesting and useful changes in physical and mechanical properties. (23 refs.)

107831 Acoustic emission transformation ratio during irreversible crystal deformation. V.V.Bovenko.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.8, p.42-5 (1983). In Ukrainian.
The acoustic emission transformation ratio is theoretically calculated and compared with experimental data. The conclusion reached is that it may be used to determine dimensions of moving sources and the ratio of particle velocity in a wave to sound velocity. The research is of great significance for identification of acoustic emission signals and for creation of the predestruction state theory. (12 refs.)

107832 Behavior of sodium near melting point found by measurement of sound velocity. H.Kamioka (Dept. of Phys., Gifu Univ., Gifu, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2433-9 (July 1983).
The sound velocity of sodium was measured in the solid phase and the liquid phase near the melting point by ultrasonic pulse transmission method. The temperature range of the experiment was from 19°C to 160°C, and the frequency of sound used was 1 MHz. The sound velocity and its temperature coefficient in the solid phase just below the melting point (97.8°C) were 3180 m/s and −1.23 m/s.deg, respectively; and those in the liquid phase just above the melting point were 2512 m/s and −0.52 m/s.deg, respectively. By combining the present results with the existing data of thermal expansivity and specific heat, the elastic properties of sodium at and around the melting temperature were presented and discussed. (29 refs.)

107833 Change of ultrasonic wave velocity in indium near the melting point. H.Kamioka (Dept. of Phys., Gifu Univ., Gifu, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2784-9 (Aug. 1983).
The ultrasonic wave velocity of indium was precisely measured in the temperature range from 120 to 183°C including the melting point. An ultrasonic pulse transmission method was used and the adopted sound frequency was 1 MHz. The melting point of the specimen was 156.4°C. The sound velocities were 2504 m/s in the solid phase just below the melting point and 2297 m/s in the liquid phase just above the melting point. The temperature coefficients of the sound velocity were 0.191 m/s.deg in the solid phase and 0.254 m/s.deg in the liquid phase. By combining the present results with existing data of thermal expansivity and specific heat, the elastic properties of indium at and around the melting temperature were reduced, and discussion was made on the obtained results. 62.80 ULTRASONIC RELAXATION

(see also 74.30G Ultrasonic attenuation in superconductors, 43.35 Ultrasonics)

107834 Pressure dependence of sound absorption in an aqueous solution of $CaSO_4$. C.C.Hsu, F.H.Fisher (Marine Phys. Lab., Univ. of California, San Diego, CA, UA).
J. Phys. Chem. (USA), vol.87, no.14, p.2581-4 (7 July 1983).
Sound adsorption has been measured in a 0.001 M aqueous solution of $CaSO_4$ at 25°C. The values of maximum absorption per wavelength 10^6 $(a\lambda)_{max}$, are 10.3 ± 0.1 at 1 atm and 7.7 ± 0.1 at 307 atm. The relaxation frequency is 177 ± 9 kHz at 1 atm and, within experimental error, is independent of pressure. This corresponds to an inner coordination sphere substitution rate of about 10^6, 2 orders below that of 2×10^8 quoted by M. Eigen and K.Z. Tamm (1962). At 1 atm, the $CaSO_4$ absorption is about 30% that of the same concentration of $MgSO_4$. (15 refs.)

63.10 GENERAL THEORY

107835 Classfication of the vibrational spectrum of a crystal for irreducible co-representation. A method of secular equation train. O.V.Kovalev.
Ukr. Fiz. Zh. (USSR), vol.28, no.7, p.1103-5 (July 1983). In Russian.
The author expresses the energy as a sum of invariant coordinate combinations realising irreducible co-representation taking into account symmetry. A method is proposed to calculate frequencies in the complex case of some similar irreducible co-representations of the second type that cannot be analysed using usual methods. (1 ref.) *V.G.P.*

63.20 PHONONS AND VIBRATIONS IN CRYSTAL LATTICES

107836 Topological singularities and phonon focusing. D.Armbruster, G.Dangelmayr (Inst. fur Informationsverarbeitung, Univ. of Tubingen, Tubingen, Germany).
Z. Phys. B (Germany), vol.52, no.2, p.87-94 (1983).
The focusing directions of phonon images generated by the anisotropic propagation of ballistic phonons are interpreted as singularities of the Gauss map of the energy surface. While a linear dispersion produces only folds and cusps, a nonlinear dispersion relation generically induces singular events for critical values of the frequency. These events are classified by means of catastrophe theory and the local topology on the energy surfaces is elucidated. On reflection planes or symmetry axes new types of singularities occur. The consequences of Morse singularities in the dispersion relation for the focusing directions are discussed. (17 refs.)

107837 Systematic experimental and theoretical studies of the lattice vibrations of host atoms and substitutional Sn impurities in III-V semiconductors. O.H.Nielsen (Inst. of Phys., Univ. of Aarhus, Aarhus, Denmark), F.K.Larsen, S.Damgaard.
Z. Phys. B (Germany), vol.52, no.2, p.99-109 (1983).
The lattice vibrations of the two constituent atoms in the III-V semiconductors GaP, GaAs, GaSb, InP, InAs, and InSb have been studied experimentally by neutron diffraction and theoretically by calculations within the framework of various phonon models proposed in the literature for these compounds. The mean-square amplitudes (measured at 295K) show a general increase with increasing lattice constant and seem furthermore to reflect the partial ionicity of the compounds. The different phonon models for the lattice dynamics are compared with each other and tested critically against the experimental data. Several models are found to be insufficient. The most satisfactory ones are some shell models. ^{119}Sn Mossbauer impurity atoms have been implanted site-selectively on the two different substitutional lattice sites and their Debye temperatures have been determined. A rigorous result relating Debye temperatures of host and impurity atoms permits a simplified interpretation of the experimental results in terms of 'Einstein-Debye force constants'. (73 refs.)

107838 Dynamics and thermodynamics of anharmonic crystals near the instability point. C.Malinowska-Adamska (Inst. of Phys., Tech. Univ. of Lodz, Lodz, Poland).
Phys. Status Solidi b (Germany), vol.118, no.2, p.535-9 (1 Aug. 1983).
Using the self-consistent phonon theory based on the thermodynamic double-time Green's function method, the dynamics of the crystal lattice and the thermodynamics of anharmonic cubic crystals in the vicinity of the instability point are investigated. The results of calculations for the instability temperature T_s, relative displacements of atoms, anharmonic contributions to the free energy, and free Gibbs energy as well as the isothermal elastic constants are given and compared with experimental and other theoretical data for potassium, sodium, and rubidium. 63.20D Phonon states and bands, normal modes, and phonon dispersion

107839 X-ray diffraction determination of the mean-square static and dynamic displacements of atoms from the equilibrium position in solid solutions of the Fe-Ni system. A.G.Mikolaichuk, D.I.Vadets, V.D.Martynyuk, Ya.I.Fedyshin (Iv. Franko L'vov State Univ., L'vov, Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.8, p.1108-12 (Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.8, p.1312-15 (Aug. 1982).
With an increase in temperature, the mean-square static displacements of atoms decrease for alloys of the Fe-Ni system containing 35, 44, 73, 80, and 90 at.% Ni. For the alloy with 50 at.% Ni, the mean-square static displacements of atoms do not vary in the temperature range from room temperature to 473K. The mean-square static displacements of atoms in Invar alloys decrease with an increase in temperature from room temperature to 973K. (8 refs.)

107840 Mode instability in NaCl structure under pressure. B.Okai (Nat. Inst. for Res. in Inorganic Materials, Ibaraki, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2289-92 (July 1983).
Mode instability is shown to occur in two models of NaCl structure as the applied pressure increases. One is Kellermann's model which neglects the field polarizability of the ions. In the other, this factor is taken into account along with distortion polarizability. In both of them, the transverse acoustic mode in the symmetric [100] direction becomes unstable; in the former, at the Γ point and in the latter, at the X point. With further increase of pressure, the longitudinal acoustic [100] mode becomes unstable at the X point in both cases.

107841 Infrared investigation of lattice vibration in black phosphorus. S.Terada, T.Hattori, M.Kobayashi, Y.Akahama, S.Endo (Dept. of Material Phys., Osaka Univ., Osaka, Japan), S.Narita.
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2630-3 (Aug. 1983).
The lattice vibrations in black phosphorus single crystals prepared under high pressure have been studied. The transmission spectra at various temperatures in a frequency range of 100-1000 cm^{-1} have been measured. The authors have found in the spectra at 1.5K sharp absorption peaks at 110, 132 and 474 cm^{-1}. By measuring the temperature, magnetic field and light-polarization dependences of the spectra and also by examining the correspondence of the observed several peaks in the spectra with the combinations of the single phonon modes, one can determine the energies of the two single infrared active phonon modes: B_{1u} and B_{2u}. (6 refs.)

107842 Phonon spectrum of boron nitride with wurtzite structure. T.D.Sokolovskii (Inst. of Phys. of Solids & Semiconductors, Acad. of Sci., Minsk, Belorussian SSR).
Phys. Status Solidi b (Germany), vol.118, no.2, p.493-8 (1 Aug. 1983).
Using quantum mechanics methods the interatomic force constants for the rigid-ion model of boron nitride with wurtzite structure are calculated. An analysis of the asymmetry of the fundamental vibrations of the lattice is performed by construction of the projection operators. Calculations of the phonon dispersion relations along seven directions of high symmetry of this lattice are carried out in the harmonic approximation. In terms of this model the phonon state density and the specific heat temperature dependence are determined for boron nitride with the wurtzite structure, the results being in good agreement with the experimental data on the specific heat. (18 refs.)

107843 On the translation mode of the kink lattice of a quasi-one-dimensional Peierls-Frohlich system with a nearly half-filled band. H.J.Fischbeck (Zentralinst. fur Elektronenphys., Akad. der Wissenschaften, Berlin, Germany).
Phys. Status Solidi b (Germany), vol.118, no.2, p.595-603 (1 Aug. 1983).
The translation mode of the kink lattice of a quasi-one-dimensional Peierls-Frohlich system in the continuum limit is investigated by means of the Landau expansion of the thermodynamic potential. An expression for the sound velocity is given and numerically evaluated. (9 refs.)

107844 Determination of the phonon density of states from the thermodynamic functions of a crystal (scandium and yttrium). V.A.Korshunov.
Russ. Metall. (GB), no.2, p.113-16 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.2, p.128-30 (1982).
For the group IIIA transition metals scandium and yttrium Tikhonov's regularisation method (see Dokl. AN SSSR, vol.151, no.3, p.501, 1963) provides a solution to the incorrectly formulated problem of determining the densities of states from the temperature dependence of the heat capacity of the phonons. The structures of the phonon densities of states found for Sc and Y are in good agreement with neutron-diffraction results. (23 refs.)

107845 Longwave optical phonons in $ZnTe_{1-x}S_x/_2Se_x/_2$ solid solutions. A.P.Litvinchuk, M.Ya.Valakh, G.G.Tarasov.
Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1194-8 (Aug. 1983). In Russian.
Phonon spectra of ternary $ZnTe_{1-x}S_{x/2}Se_{x/2}$ solid solutions are studied by Raman light scattering. The experimentally observed dependences of the long-wave optical phonon frequencies are compared with theoretical ones obtained on the basis of the isodisplacement model. The theoretical and experimental data are in good agreement. (9 refs.)

63.20M Phonon-defect interactions

107847 Solitons in a linear lattice with defects. V.Narisimha Iyer (Dept. of Phys., Mahatma Gandhi Coll., Trivandrum, India), K.S.Viswanathan.
Pramana (India), vol.20, no.5, p.415-27 (May 1983).
Solitons are generated in an anharmonic linear lattice in which neighbouring atoms interact through a Morse potential by giving either a strong initial impulse or a large displacement to an end atom. Studies on the variation of the characteristic properties of the soliton with the strength of the initial pulse show that the velocity and the amplitude of the soliton increase with the strength of the initial impulse, but below a certain critical value for the initial impulse, only an oscillatory tail is generated. It is shown that when a defect is present in the lattice, a localised mode appears at the site of the defect and additional solitons travelling forward or even backwards, are generated. When two solitons collide at a defect region, they reemerge but leave a localised mode at the site of the defect. If an initial velocity is imparted to a particular particle, synchronously with the crossing of the particle by the soliton, a localised mode emerges at the site of the particle and additional solitons are also generated. When a soliton moves from a denser to a rarer medium, a strong localised pulse is created near the region of the density discontinuity and additional solitons appear; and further a weak oscillatory tail is left behind in the denser medium. On the other hand, if a soliton moves from a rarer to a denser medium, it is reflected back and a small localised mode is generated at the site of the density discontinuity. The variation of amplitude of the soliton with the velocity of propagation is also studied. (9 refs.)

107848 Lattice vibrations around a vacancy and vacancy clusters in metals. R.Yamamoto (Dept. of Metall. & Materials Sci., Univ. of Tokyo, Tokyo, Japan).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.120-5
The local vibrational densities of states of the neighbor atoms of a vacancy and vacancy-clusters in Cu, Fe and Ti were calculated by the recursion method. Broad resonant mode was found in the local frequency spectra of the first nearest neighbors. The influence of vacancy-type defects on the vibrations of the neighboring atoms is rather short range. (12 refs.)

107849 Computer simulations on the atomic vibration around a vacancy in refractory metals, V, Mo, Ta, and W. A.Suzuki, R.Yamamoto, M.Doyama (Dept. of Metall. & Materials Sci., Univ. of Tokyo, Tokyo, Japan).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.126-9
The local vibrational densities of states (LDS) around a vacancy in V, Mo, Ta and W were computed using the recursion method. The stage III temperatures (T_{III}) in radiation damage were estimated from these LDSs. (10 refs.)

107850 Lattice vibrations around point defects in cubic transition metals. K.Masuda (Dept. of Materials Sci. & Engng., Tokyo, Inst. of Technol., Yokohama, Japan).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.130-2
A (self-consistent) tight-binding type electronic theory and Born-Mayer repulsive potential are used to calculate the local vibrational spectra $g_i(\omega)$ and Debye parameters for the atoms near the vacancy-type lattice defects in cubic transition metals: $g_i(\omega)$ is determined by employing the recursion method. The so-called stage III temperature is also estimated using the calculated vibrational spectra. It is shown that inclusion of electronic effects (d-band narrowing and atomic relaxations) is important for the atomic vibrations near the defects. (12 refs.)

107851 Theory of the lattice vibration behaviour near point defects. I.Kanazawa, H.Murakami (Dept. of Phys., Tokyo Gakugei Univ., Tokyo, Japan), M.Doyama.
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.133-5
A new theory about the vibration behaviour near point defects is introduced by the application of the Matsubara Green's function. This theory have a wide range of application rather than the formality by Dederichs and Zeller. The effect on interaction between the resonance mode and electrons was also discussed. (3 refs.)

63.50 VIBRATIONAL STATES IN DISORDERED SYSTEMS

107852 Theoretical description of photochemical hole burning in soft glasses. B.Jackson, R.Silbey (Dept. of Chem., MIT, Cambridge, MA, USA).
Chem. Phys. Lett. (Netherlands), vol.99, no.4, p.331-4 (12 Aug. 1983).
The temperature dependence of the photochemical hole widths of molecules in soft glasses (T^α, $\alpha \approx 1.3$-1.5) is explained by a combination of two dephasing mechanisms. The narrow distribution of two-level systems in such glasses gives rise to one contribution, and the dephasing of localized librational modes by long-wavelength phonons provides a second contribution. The authors show that in the range $T \leq 25$K, the theoretical temperature dependence agrees with the experiment. (18 refs.)

107853 Vibrational spectra of hydrogen in silicon and germanium. M.Cardona (Xerox Palo Alto Res. Center, Palo Alto, CA, USA).
Phys. Status Solidi b (Germany), vol.118, no.2, p.463-81 (1 Aug. 1983).
Aims to give a comprehensive discussion of the vibrational spectra of hydrogen (or deuterium) in a-Si, c-Si, and c-Si surfaces and in a-Ge. A simple valence force field model for the vibrational frequencies of Si-H bonds is presented. The observed vibrational spectra are discussed in the light of the results of the model, and by comparison with the spectra of polysilanes and cyclopolysilanes. The author also discusses the strength of IR absorption lines. This makes it possible to determine the concentration of Si-H bonds in the various coexisting species. Finally, a similar, though less complete discussion is presented for a-Ge. (55 refs.)

107854 Plastic-deformation dependence of the Gruneisen parameter strain derivatives. P.M.Ossi (Istituto di Ingegneria Nucleare, CESNEF, Politecnico di Milano, Milano, Italy).
Nuovo Cimento D (Italy), vol.2D, ser.1, no.4, p.953-64 (July-Aug. 1983).
The strain derivatives of the Gruneisen parameter γ at room temperature are experimentally found to strongly depend on the plastic deformation ϵ_p imposed to the solid. γ is very sensitive to the alterations of the microstructure, which in turn remarkably influences the lattice dynamics of the crystal. To test such a complex interaction, measurements were performed on α-titanium at values of ϵ_p up to 10^{-1}. The obtained exponential relations between the strain derivatives of γ at the origin and ϵ_p are discussed for the first- and the second-order derivatives, $\partial\gamma/\partial\epsilon|_0$ and $\partial^2\gamma/\partial\epsilon^2|_0$, respectively. The results allow not only for a deeper knowledge of the γ behaviour, but also for outlining the work-hardening evolution in metallic materials. (11 refs.)

107855 Strain dependence of the amplitude of lattice vibration in a cubic crystal. M.Sugiyama (Dept. of Engng. Sci., Nagoya Inst. of Technol., Nagoya, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2428-32 (July 1983).
The coefficients of the linearized basic equations for thermo-elasticity and lattice vibration derived from the continuum approximation of the self-consistent Einstein model are estimated for FCC (Cu, Ag, Al, Pb, Ni) and BCC (Cr, Mo, W, Fe) crystals by assuming the Morse type pair-potentials. Two typical deformations, i.e. a uniaxial extension and a simple shear, are studied by using the linearized equations to show explicitly the effect of strain on the amplitude of the lattice vibration in a cubic crystal.

64.00 EQUATIONS OF STATE, PHASE EQUILIBRIA, AND PHASE TRANSITIONS

(see also 82.60 Chemical thermodynamics)

64.10 GENERAL THEORY OF EQUATIONS OF STATE AND PHASE EQUILIBRIA

107856 Vapor-liquid equilibria calculations by means of an equation of state. A.Vetere (Primary Chem. Lab., ASSORENI, Milanese, Italy).
Chem. Eng. Sci. (GB), vol.38, no.8, p.1281-91 (1983).
An eight parameter equation of state has been applied to correlate vapor-liquid equilibria of binary and ternary mixtures, both polar and apolar, representative of various classes of compounds including high molecular weight compounds and quantal gases. The experimental field investigated ranges from subatmospheric to high pressure (up to 400 ata) and from cryogenic to high temperatures. It is shown that three binary interaction parameters are sufficient to correlate each binary system. Rules are given for calculating the eight pure component parameters when volumetric data for some compounds are lacking or inaccurate. (29 refs.)

107857 Modified Redlich-Kwong equation of state for saturated vapour-liquid equilibrium. J.Lielmezs, S.K.Howell, H.D.Campbell (Chem. Engng. Dept., Univ. of British Columbia, Vancouver, BC, Canada).
Chem. Eng. Sci. (GB), vol.38, no.8, p.1293-301 (1983).
Defining the dimensionless temperature T^* as: $T^* = [(T_c/T)-1]/[(T_c/T_{NB})-1]$ a new temperature dependence of the attractive force part of the Redlich-Kwong equation of state is presented. The new modified Redlich-Kwong equation predicts the saturated liquid-vapour equilibrium states accurately over the entire liquid range from the triple point up to the critical point. A comparison is made with experimental data for a series of selected organic, inorganic and quantal fluids (34 compounds, 740 data points pairs) and results obtained by the use of two modifications by Soave of the Redlich-Kwong equation of state. (90 refs.)

107858 Pore motion and change of shape in a temperature field because of evaporation and condensation processes. R.Ya.Kucherov, L.N.Shulepov.
J. Eng. Phys. (USA), vol.44, no.1, p.69-72 (Jan. 1983). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.44, no.1, p.83-7 (Jan. 1983). [received: Sept. 1983]
Mass transfer in a vacuum spherical and cylindrical pore due to evaporation and condensation of the wall material in a temperature gradient field is examined on the basis of a molecular-kinetic analysis. (5 refs.)

107859 The equation of state for the hard sphere fluid at high density. The glass transition. R.J.Speedy (Chem. Dept., Victoria Univ. of Wellington, Wellington, New Zealand).
Physica B & C (Netherlands), vol.121B+C, no.1-2, p.153-61 (1983).
A new equation of state for the hard sphere and hard disc fluids is derived from the assumption that the correlation function $g(r,\phi)$, for the density of particles at a point ϕ on the surface of a pair of cavities separated by r, has the same density dependence as an arbitrary linear combination of $g(\sigma)$ and $(g(\sigma))^2$. This assumption provides a closure on the YBG hierarchy at the level of $g^{(3)}$. The equation is accurate over the entire fluid range and becomes unphysical a little beyond the freezing density. It predicts that the isothermal compressibility goes to zero, at a finite pressure, at a density $z_s = 0.75$ (relative to close packing). This observation accounts for the computer simulation results which indicate that the fluid becomes kinetically unstable with respect to freezing at $z = 0.76$ and that a diffuse fluid-amorphous solid transition occurs near z_s in the finite time experiments. 64.60 GENERAL STUDIES OF PHASE TRANSITIONS

(for critical phenomena in quantum fluids, superconductors, magnetic materials and ferroelectrics, see 67., 74.40, 75.40 and 77.80 respectively)

107860 Algebraic investigations in Landau model of structural phase transitions. III. Extended integrity bases and thermodynamic potential. V.Kopsky (Inst. of Phys., Czechosl. Acad. Sci., Praha, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.8, p.845-69 (1983).
A review is given of the recently developed theory of the extended integrity bases, which gives a mathematical background for construction of all kinds of interactions within symmetric systems and hence also for the construction of the thermodynamic potential. It is shown for the first time that the invariants of second order for representations irreducible on the real arc of two types for those representations which are composed of two absolutely irreducible representations. Apart from the usual invariant of the form r^2 there exist also three antisymmetric invariants in the case of ireps of second kind and one antisymmetric invariant in the case of ireps of third kind. Different terms in thermodynamic potential are discussed. A special attention is given to the so-called faint variables and faint interactions in connection with application and interpretation of the Neuman's principle. It is shown, how the theory of integrity bases for covariants can be used to determine the faint interactions and interactions with external fields. The concept of exomorphism is finally discussed in connection with phase transition theory and its treatment in the language of colour groups. (29 refs.)

107861 Broadening of electronic spectra at the critical point of a binary polar mixture. L.D.Zusman (Inst. of Inorganic Chem., Acad. of Sci., Novosibirsk, USSR).
Chem. Phys. Lett. (Netherlands), vol.99, no.4, p.287-90 (12 Aug. 1983).
It is shown that in the vicinity of the critical point of a binary polar mixture the electronic spectral linewidth increases when approaching the critical point. The linewidth obeys the law $A_0[(T-T_c)/T_c]^{-\gamma}$, where γ is the universal critical index of dispersion of concentration fluctuations. (7 refs.)

107862 Computer study of the BCCj⇌FCC structure change by homogeneous deformations. P.Beauchamp, J.P.Villain (Lab. de Metall. Phys., Univ. de Poitiers, Poitiers, France).
J. Phys. (France), vol.44, no.9, p.1117-30 (Sept. 1983).
The Bain transformation BCC⇌FCC can be achieved by the two homogeneous 'shears' E and E′ proposed by Bogers and Burgers (1964). The authors first discuss the conditions for pair potentials to ensure the mechanical stability of both BCC and FCC structures; then, three phenomenological potentials for metals are used to calculate the crystal free energy density W for the deformation states $\gamma E+\gamma' E'$ (γ and γ' range from -0.5 to 1.5). The path $\gamma=\gamma'$, which keeps the crystal in a BCT structure, breaks the smallest number of symmetries and is found to be the minimum energy path. To generalize this result they have considered the elastic coefficients B (bulk modulus), $1/2(C_{11}-C_{12})$, C_{44}, C_{66} of the intermediate BCT structures: if they are positive the path $\gamma=\gamma'$ remains a minimum energy path with respect to any type of deformation. The potentials the authors have tried satisfy these conditions which, in general, are expected to be fulfilled for most potentials ensuring the mechanical stability at both ends of the path. The BCT intermediate structures are characterized by $\eta_1=(\text{Log } c/a)/\text{Log}\sqrt{2}$. The energy density $W(\eta_1)$ presents two minima at $\eta_1=0$ (BCC) and $\eta_1=1$ (FCC) separated by a maximum. The first derivative $dW/d\eta_1$ is proportional to the applied stress. The inflexion points, where the second derivative $d^2W/d\eta_1{}^2$ vanishes, define critical strains and stresses for the triggering of the transformation; these strains are of the order of 1/4 of the full Bain distortion and these stresses are lower than the theoretical shear strength. Besides, critical lines have been determined in the five planes (η_1, η_i) where η_i is either one of the shears $\{110\}\langle 1\bar{1}0\rangle$, ϵ_{23}, ϵ_{13}, ϵ_{12}, or an isotropic deformation. (18 refs.)

107863 The role of an isotropic term in governing the temperature range of the incommensurate phase. Y.Ishibashi (Synthetic Crystal Res. Lab., Nagoya Univ., Nagoya, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2634-6 (Aug. 1983).
An isotropic term of the form $QQ^* (\partial Q/\partial x)(\partial Q^*/\partial x)$ is taken into account in the Landau-type thermodynamic potential functional for normal-incommensurate-commensurate phase transitions, and is shown to play quantitatively an important role in governing the temperature range of the incommensurate phase.

107864 Monte Carlo investigation of the Mitsui model. V.I.Zinenko, N.G.Tomshina (Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).
J. Phys. C (GB), vol.16, no.25, p.4997-5007 (10 Sept. 1983).
Two- and three-dimensional Mitsui models (1958) are investigated by Monte Carlo simulation. The temperature dependence of the order parameter, the susceptibility, the energy and the specific heat are computed. It is shown that in the region where $a+1>2\gamma$ all two- and three-dimensional lattices have one second-order phase transition in the 'ferroelectric' phase. In the region where $a+1<2\gamma$ just one type of three-dimensional lattice ($Z_1=2$, $Z_2=4$) has two second-order phase transitions. In this case the order parameter between two critical points has a dome-shaped temperature dependence. (17 refs.)

107865 Kinetics of domain growth in two dimensions. A.Sadiq, K.Binder (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany).
Phys. Rev. Lett. (USA), vol.51, no.8, p.674-7 (22 Aug. 1983).
The growth of ordered domains following a quench of a system from a temperature T in the disordered phase to a state below the critical temperature T_c is simulated by Monte Carlo computations. For a square-lattice gas with (fourfold-degenerate) 2×1 order the domain size $L(t)$ grows with time t as $L(t)\propto t^x$, $x\simeq0.35$ (density conserved) and $x={}^1/_2$ (density not conserved), respectively. Quenches to T_c and to $T=0$ are also discussed. (28 refs.)

107866 Eight-vertex model of two-dimensional domain walls. F.S.Rys (Fachbereich Phys., Freie Univ. Berlin, Berlin, Germany).
Phys. Rev. Lett. (USA), vol.51, no.10, p.849-52 (5 Sept. 1983).
A statistical model of interacting linear domain walls (occurring, e.g. in monolayer adsorbates) is solved on the square lattice with use of exact and numerical results of an equivalent eight-vertex model. For attractive walls a commensurate and an incommensurate phase are separated by a first-order line for stiff walls and by a fluid phase for flexible walls. The phase boundaries with the fluid phase are Ising-like. For repulsive stiff walls an intermediate striped phase with a nonuniversal boundary occurs which vanishes for higher flexibilities. Moreover, disorder lines are located. (21 refs.)

107867 Contribution to the solution of Heisenberg's model for phase transitions: the A2→B2 disorder-order transition in binary alloys of AB stoichiometry. F.Reynaud (Lab. d'Optique Electronique, CNRS, Toulouse, France).
Physica B & C (Netherlands), vol.121B+C, no.3, p.389-404 (Aug. 1983).
A fictitious spin operator is introduced in the state space of a lattice site i of a binary alloy. The spin operators of an isolated pair of nearest-neighbour sites i and j are coupled by the Heisenberg exchange Hamiltonian. Introduction of the Gibbs grand canonical ensemble enables one to show that the interaction Hamiltonian between the pair ij and the rest of the crystal may be written simply as $\hat{H}_{\text{int}}=-\mu\hat{N}$ (where $\hat{N}$ is the particle number operator corresponding to the long-range-order parameter and μ is its intensive conjugate variable). The state vector and the density matrix of the pair ij are then obtained by diagonalizing the operator corresponding to the grand canonical potential. Among others, the grand partition function is obtained as a function of the intensive variables of the problem. Neither the symmetry of the state vector nor the long-range-order parameter is a constant of the motion; they fluctuate with time in the vicinity of the transition. (20 refs.)

107868 Shift of phase equilibrium in highly dispersed systems. S.P.Chizhik, N.S.Lidorenko, N.T.Gladkikh, L.K.Grigor'yeva, R.N.Kuklin.
Russ. Metall. (GB), no.1, p.68-70 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.1, p.80-2 (1982).
It was established on the basis of a microscopic approach that a decrease in melting temperature results from a decrease in the energy of formation of vacancies in a dispersed particle due to the dimensional vacancy effect. The existence of more than one phase in a highly dispersed particle is impossible due to the instability of the thermodynamic state with the order parameter which is equal to the dimension of an ultradispersed particle. (12 refs.)

107869 Dimensional vacancy effect in the theory of homogeneous nucleation. N.S.Lidorenko, S.P.Chizhik, N.T.Gladkikh, L.K.Grigor'yeva, R.N.Kuklin.
Russ. Metall. (GB), no.1, p.70-3 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.1, p.82-6 (1982).
The size of a critical nucleus, taking into account the dimensional vacancy effect, is lower than the corresponding value predicted from the defect-free model. It follows from the dimensional vacancy effect that the energy barrier of formation of a nucleus of the new phase in a metastable thermodynamic system will decrease. The dimensional vacancy effect explains the experimentally observed rapid phase transitions of the first kind. (11 refs.)

107870 Kinetics of the chemo-epitaxial formation of a new phase during diffusional reaction. P.I.Ignatenko.
Russ. Metall. (GB), no.2, p.150-4 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.2, p.167-71 (1982).
In diffusional reaction in a given binary system, under isothermal conditions, there is preferential formation of two-dimensional nuclei of the new phase at saturations which are lower, the larger the difference between the free energies of formation of the two-dimensional and three-dimensional critical nuclei and the larger the difference between the activation energies of surface and volume diffusion. The rate of growth of the nuclei of the new phase during diffusional reaction is determined by the type of interface and by the saturation conditions of the mother phase by external elements and is largely dependent on the difference between the free energies of the contacting phases. 64.70 PHASE EQUILIBRIA, PHASE TRANSITIONS, AND CRITICAL POINTS

(see also 81.30 Phase diagrams and microstructures developed by solidification and solid-solid phase transformations)

107871 Comparison of triple point temperatures realized in two different types of sealed cells. O.Tamura, H.Sakurai (Nat. Res. Lab. of Metrology, Ibaraki, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.6, p.L356-7 (June 1983).
The temperature differences between the triple points of neon, oxygen and argon realized in two types of sealed cells designed by the Istituto di Metrologia 'G. Colonnetti' (IMGC, Italy) and the National Research Laboratory of Metrology (NRLM, Japan) are measured. The triple point temperatures for neon and argon agree within the error of measurement between the two types of cells, while the oxygen triple point of the NRLM cell is 1.4 mK higher than that of the IMGC cell. (8 refs.)

107872 The stability of the phases in the Ln_2O_3-FeO-Fe_2O_3 systems which are stable at elevated temperatures (*Ln*: lanthanide elements and Y). N.Kimizuka, A.Yamamoto, H.Ohashi (Nat. Inst. for Res. in Inorganic Materials, Ibaraki-ken, Japan), T.Sugihara, T.Sekine.
J. Solid State Chem. (USA), vol.49, no.1, p.65-76 (Aug. 1983).
Thermochemical data on $LnFeO_3$, $Ln_3Fe_5O_{12}$, and $(LnFeO_3)_nFeO$ ($n=1$ and 2) which are stable in the Ln_2O_3-FeO-Fe_2O_3 systems at elevated temperatures are reevaluated and interpreted on the basis of a simple point charge ionic model (*Ln*:lanthanide elements and Y). As the radius of the *Ln* ion in each compound decreases, the $LnFeO_3$ compound (distorted perovskite type) becomes less stable, the $Ln_3Fe_5O_{12}$ compound (garnet type) is the most stable for Ln=Tb, and the $(LnFeO_3)_nFeO$ compounds (layered structures) become more stable. The stability of each phase is strongly dependent upon the fitting of *Ln* ion in *A*-site position for the perovskite structure, in the dodecahedral site position for the garnet structure, and in the octahedral site positions for the layered structure compounds, respectively. It is qualitatively useful to estimate the Madelung energies of a series of isostructural phases on the basis

of a simple point charge ionic model, especially as a guide for understanding a series of new phase diagrams which describe the isostructural phases. (30 refs.)

64.70D Solid-liquid transitions

(see also 81.30F Solidification)

107873 Influence of doping on the liquid-amorphous transition induced by picosecond laser irradiation of Si. S.U.Campisano, P.Baeri, Jing-Ping Zhang, E.Rimini (Istituto Dipartimentale di Fisica, Catania, Italy), A.M.Malvezzi.
Appl. Phys. Lett. (USA), vol.43, no.4, p.370-2 (15 Aug. 1983).
The effect of Bi doping on the quench of amorphous Si directly from the melt during 30-ps, 0.53-μm laser irradiation has been studied. The amorphous thickness (45 nm) in Bi implanted samples was observed to increase 50% over the corresponding undoped samples (25 nm). No change in the Bi profile was detected upon amorphization. (12 refs.)

107874 Instability of 'slow' solid-liquid interface relaxation before the hetero-LPE of III-V compounds. Yu.B.Bolkhovityanov, S.I.Chikichev (Inst. of Semiconductor Phys., Acad. of Sci., Novosibirsk, USSR).
Cryst. Res. & Technol. (Germany), vol.18, no.7, p.847-57 (1983).
Results of specially designed experiments supplemented by numerous literature examples have been analysed in an attempt to elucidate the processes occurring at the interface between saturated multicomponent liquid and a non-equilibrium solid before the hetero-LPE of nearly lattice-matched III-V compounds. The 'slow' interface relaxation which provides the moving of non-equilibrium solid-liquid system in the direction of thermodynamic equilibrium by solid-state diffusion (and which was previously believed to be the only way of equilibrium approach in lattice-matched systems) loses the stability in some cases, being replaced by 'fast' relaxation. It has been shown that the liquid-solid interface instability develops due to a collective action of several factors, and their particular combination produces definite mode of relaxation. The 'slow' relaxation would be unstable, if, as a result of underlying solid dissolution: (I) the lattice parameter of equilibrium solid decreases continuously with respect to that of the substrate, increasing thereby the driving force for dissolution; (II) the solubility of group V component in a changed liquid increases. In a majority of cases the switching to 'fast' relaxation is facilitated by (III) the initial negative difference between the lattice parameters of equilibrium and underlying solids at the growth temperature. (38 refs.)

107875 Metastable zone width in salting-out crystallisation. P.H.Karpinski, J.Nyvlt (Inst. of Chem. Engng. & Heat Systems, Tech. Univ., Wroclaw, Poland).
Cryst. Res. & Technol. (Germany), vol.18, no.7, p.959-65 (1983).
Measurements of the metastable zone width, giving information on nucleation characteristics, have been used for crystallisation by cooling until now. This approach is now adopted for salting-out of inorganic salts from aqueous solutions by addition of an organic solvent. Theoretical description is illustrated by precipitation of magnesium sulphate using methanol and ethanol as second solvents. (12 refs.)

107876 Field equations of a crystallization front. F.Vodak (Faculty of Civil Engng., Czech Tech. Univ., Praha, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.8, p.930-40 (1983).
The paper deals with the transition zone at the dividing surface in a solid-liquid system. This transition zone (the crystallization front) is modelled as a discontinuity surface in continuum. It is shown that the mechanical, thermodynamic, structural and morphological conditions of the front are described by thirty-eight scaler parameters. Equations representing the space-time evolution of these parameters are formulated. The relation of these equations to Stefan's problem is discussed. (22 refs.)

107877 Fusion in phosphate systems at temperatures up to 2970K. Z.Ya.Kanepe, Z.A.Konstant, B.A.Skrebe (Inst. of Inorganic Chem., Acad. of Sci., Latvian SSR).
Inorg. Mater. (USA), vol.18, no.8, p.1133-5 (Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.8, p.1338-40 (Aug. 1982).
A method has been developed for determining the melting points of substances, including phosphates, up to temperatures of 2970K, by using a graphite atomiser in standard production. Interaction in the binary system $ScPO_4$-Sc_2O_3 has been investigated, and a phase diagram has been constructed for this system on the basis of the results obtained. (9 refs.)

107878 Self-sustaining crystallization of amorphous layers of water and heavy water. V.P.Koverda, N.M.Bogdanov, V.P.Skripov (Dept. of Phys.-Tech. Problems of Energetics, Acad. of Sci., Sverdlovsk, USSR).
J. Non-Cryst. Solids (Netherlands), vol.57, no.2, p.203-12 (1 Sept. 1983).
An experimental study of the kinetics of crystallization of the amorphous condensates H_2O and D_2O has been carried out and their glass-transition temperatures have been measured. The results are explained from the position of the mass crystallization theory, the nonstationary nucleation being taken into account. The conditions of emergence of self-sustaining crystallization of water amorphous layers are analyzed. (18 refs.)

107879 Use of classical Stefan problem for initializing solution in the numerical prediction of freezing. V.M.Gorislavets, V.A.Mitrokhin (All-Union Petroleum & Gas Sci.-Res. Inst. on Construction of Main Pipelines, USSR).
J. Eng. Phys. (USA), vol.43, no.5, p.1304-8 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.5, p.847-50 (Nov. 1982). [received: Sept. 1983]
The exact solution of the classical Stefan problem is examined from the point of view of using it as an 'initial solution' in numerical solutions of appropriate problems. (11 refs.)

107880 Relationship between some thermodynamic parameters and the tendency of metallic melts to glassify. A.V.Gorokh, B.F.Belov.
Russ. Metall. (GB), no.2, p.183-6 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.2, p.201-4 (1982).
In the analysis of the changes in the thermophysical characteristics of substances during heating and cooling, a graph of the relationship between these characteristics and the enthalpy H rather than the temperature is more informative. The thermodynamic meaning of supercooling is that the derivative dT/dH of the cooling of a melt is larger than it is when a solid body is heated. The entropy, as a function of enthalpy, changes continuously during melting of a solid, which indicates that there is a state transitional between the liquid and solid states. During the change from the molten to the solid crystalline state, such a transitional state does not form, as evidenced by the sudden discontinuous spontaneous crystallisation of a supercooled melt. The prevention of spontaneous crystallisation and the associated adiabatic decrease in the configurational entropy of the substance is the main task in the problem of glassification of metallic melts. (9 refs.)

107881 Formation of disperse liquid zones at coherent boundaries in superheated FCC crystals. E.S.Kucherenko (Metall. Inst., Dnepropetrovsk, Ukrainian SSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.108-9 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.188-9 (Jan.-Feb. 1983). [received: Sept. 1983]
Gives the results of observations indicating the presence of defects of structure in coherent boundaries of annealing twins in FCC alloys, so that they play the part of effective sources of fusion centers. For deformed twins it has been observed that there is an increased degree of distortion of the regions in the crystal adjoining the coherent boundaries and that they are saturated with dislocations. Near the coherent boundaries of recrystallization twins, such zones were not observed. The investigations were made with the alloys Cu+7, 14, 15.5, 22% Zn, Cu+5, 10% Ga, and Cu+1.5, 3.5% Si (wt.%). (3 refs.)

107882 The role of cubic ice in freezing of a supercooled water droplet. T.Takahashi.
Solid State Phys. (Japan), vol.18, no.5, p.279-86 (May 1983). In Japanese.
To clarify the formation mechanism of snow polycrystals which are characterized by the misorientation of 70.5°-70.6° about [1120], the formation process of a cubic ice is discussed by the homogeneous and two-dimensional nucleation theory. (23 refs.)

107883 Monotectic alloy solidification—determination of the liquidus surface in the system succinnonitrile-ethanol-glycerol. R.N.Grugel, A.Hellawell (Dept. of Metall. Engng., Michigan Technol. Univ., Houghton MI, USA).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.417-22
The microstructure of alloys undergoing a monotectic reaction, Liquid I$\rightleftarrows$solid I+liquid II, is related to the height of the liquid miscibility gap, upper consolute temperature, T_C, relative to that of the monotectic horizontal at T_M. It has been shown in the system Cu-Pb-Al that a transition in microstructure occurs as the temperature interval, T_C-T_M, changes with composition. In order to observe the structural change directly in a transparent material, it has been necessary to determine the liquidus surface for the system succinnonitrile (S)-ethanol (E)-glycerol (G). In this system monotectic reactions in the binary S-E and S-G systems are joined by a monovariant valley and a structural transition occurs at approximately 85.6 wt.% S, 7.5 wt.% E, 6.9 wt.% G, at a ratio of 48:52=G:E. (10 refs.)

107884 Particle transport induced by directional solidification. H.Klein, R.Nahle (DFVLR, Inst. for Space Simulation, Koln-Porz, Germany).
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.37-40
Scientific objectives and technical implementation of the MAUS Experiment DG-315 to be flown on STS 7 are presented. The experiment studies particle transport mechanisms in multiphase dispersions using a transparent model system for optical observation. The motion of air bubbles and liquid Pb particles in molten CsCl during directional solidification is photographically recorded. The objectives are: firstly, measurement of the particle diameter dependence of the interface-tension-gradient driven velocity of the gaseous and liquid particles, and secondly, measurement of the particle diameter dependence of the critical velocity of the solidification front which separates the regimes of particle rejection by the interface, and particle trapping in the solid. (6 refs.)

107885 Precipitation of gas pores in metallic melts during cooling under microgravity. H.Shahani, H.Fredriksson (Dept. of Casting of Metals, Royal Inst. of Technol., Stockholm, Sweden).
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.71-8
In the Swedish rocket program for Material Science research a series of experiments in pore formation in Al-base alloys have been performed. The alloys were melted under high pressure H_2-atmosphere on earth and remelted at low pressure in space. Due to the pressure difference pores were formed. The nucleation and growth of the pores were analysed as a function of the pressure difference and also as a function of the alloy composition. The results of the experiment and the theoretical aspects of pore growth are both discussed. (2 refs.)

107886 On the nucleation of melts under microgravity conditions. C.Barta, A.Triska (Inst. of Phys., Czechoslovak Acad. of Sci., Prague, Czechoslovakia), V.Ilyukhin, G.Zhukov.
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.79-83
Presents results of the qualitative analysis of causes and consequences which are characteristic for the processes that take place during the gradual cooling of a multicomponent melt at $g=1$ and $g\to 0$. At the same time the authors carry out a qualitative evaluation of the suitability of experimental materials for illustrating expected differences in the course of these proceses at $g=1$ and $g\to 0$. From this point of view the authors also judge the results of the MORAVA set of experiments. On the basis of the knowledge gained the authors then formulate a hypothesis concerning the causes and consequences of the phenomena observed. The aim of the new set of experiments MORAVA II, is to test the validity of the discovered facts. (10 refs.)

107887 Convection-Marangoni effects in solidification-microgravity. A.Sanfeld, A.Steinchen (Chimie-Phys. II, Univ. Libre de Bruxelles, Brussels, Belgium), B.Billia, L.Capella.
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.281-4
The influence of convection due to the difference of densities between solid and melt and of Marangoni effects on the morphological stability of the solidification front is investigated under microgravity. A new destabilizing contribution is predicted for large velocities of growth in Newtonian or Maxwellian systems. Marangoni convection might be coupled with the morphological contribution in oscillatory regimes, for large wavelengths. (9 refs.)

107888 Convection effects at solid-liquid interfaces—influence of gravity. M.E.Glicksman, Q.T.Fang (Materials Engng. Dept., Rensselaer Polytech. Inst., Troy, NY, USA), S.R.Coriell, R.F.Boisvert.
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.313-17
The stability of the flow between two vertical, infinite, rigid, coaxial cylinders held at different temperatures is analyzed by linear stability theory. For a Prandtl number of 22.8 and a radius ratio of 0.02, the flow is unstable to an axisymmetric perturbation at a critical Grashof number of 2150; the wave speed of the instability is comparable to the maximum velocity of the unperturbed flow. When the rigid outer cylinder-fluid interface is replaced by a crystal-melt interface which can change shape, two new modes of instability occur at lower Grashof numbers. These calculations were motivated by and are in general agreement with the authors recent experiments on succinonitrile. (19 refs.)

107889 The effect of the natural convection on the solidification of metallic alloys. H.Fredriksson (Dept. of Casting of Metals, Royal Inst. of Technol., Stockholm, Sweden).
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.319-23
During solidification of metallic alloys various effects occur as a result of natural convection. Natural convection has an influence on the crystal structure as well as on the distribution of the alloying elements. The different phenomena are discussed, results are presented and analysed from a theoretical point of view. The effect of gravity on these phenomena is also discussed. (6 refs.)

107890 Processing/microstructure relationships in surface melting. R.J.Schaefer, R.Mehrabian (NBS, Wshington, DC, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.733-44
The development of predictive models for rapid surface melting and resolidification requires coupling of realistic heat flow models to emerging theories of rapid solidification processing. Attainment of unique microstructures and phases, for example through plane-front solidification and solute trapping, can be correlated to solid/liquid interface velocity, temperature and temperature gradients, and to theories of morphological stability. However, there are important limitations on achievable solid/liquid interface velocity depending upon the heating mode and heat flux distribution, melt thickness and location of the interface within the molten zone. An overview is given of the emerging guidelines for prediction and control of rapid solidification conditions and microstructures. Homogenization of the liquid by convection and diffusion is also discussed. Electron beam surface melting of alloy substrates is used as an example of these processes. (14 refs.)

64.70F Liquid-vapour transitions

107891 The coexistence curve of GeH_4 and correction-to-scaling. D.Balzarini, O.G.Mouritsen, P.Palffy-Muhoray (Dept. of Phys., Univ. of British Columbia, Vancouver, BC, Canada).
Can. J. Phys. (Canada), vol.61, no.9, p.1301-4 (Sept. 1983).
High-precision data for the coexistence curve of GeH_4 covering the reduced temperature range $10^{-6}<t<5\times10^{-2}$ have been derived from measurements of the refractive index by focal plane interference methods. The data are analyzed in terms of correction-to-scaling confluent singularities, $(\rho_l-\rho_v)/2\rho_c=A|t|^\beta(1+a_1|t|^\Delta+a_2|t|^{2\Delta})$, to yield the nonuniversal amplitudes. This is done by fitting the proposed theoretical expression to the data and by fixing the exponents to their renormalization group values. The data support the theoretical expression for $|t|\lesssim10^{-2}$. (16 refs.)

107892 Studies on the temperature dependence of vapour pressure of pure liquids and solutions. III. Measurements of rate of evaporation and (deduced) vapour pressure for n-butyl and iso-amyl alcohol from 10°C to 42°C. S.W.Ali (PCSIR Labs., Karachi, India), M.M.Qurashi.
Proc. Pak. Acad. Sci. (Pakistan), vol.19, no.1, p.1-13 (1982).
For pt.II see ibid., vol.17, no.1, p.12 (1980). In view of previous findings, it was considered worthwhile to study the corresponding behaviour of pure n-butyl and amyl alcohol. Accordingly, the authors present these measurements in the range of 30°C to 60°C for n-butyl alcohol, together with some comparative measurements for isoamyl alcohol, from 35° to 55°C. (6 refs.)

107893 X-ray total external reflectance-diffraction as a probe of the structure of the liquid-vapor interface. U.Mohanty, S.A.Rice (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA).
J. Chem. Phys. (USA), vol.79, no.5, p.2482-6 (1 Sept. 1983).
For potential use in the study of the structure of the liquid-vapor interface of a liquid metal, the authors analyze the scattering of a collimated beam of X-rays which strike the plane surface of a liquid metal at an angle below the range for total external reflection. The analysis of the diffraction pattern is based on the Von Laue model of a condensed phase scatterer and the distorted wave approximation. The X-ray total reflectance-diffraction is expresses in terms of the structure factor of the inhomogeneous transition zone between the liquid and vapor of a metal. (16 refs.)

107894 Vapor pressure isotope effects in liquid methyl fluoride. T.Ol, J.Shulman, A.Popowicz, T.Ishida (Dept. of Chem., State Univ. of New York, Stony Brook, NY, USA).
J. Phys. Chem. (USA), vol.87, no.16, p.3153-60 (4 Aug. 1983).
The vapour pressures of the isotopic methyl fluorides $^{12}CH_3F$, $^{12}CD_3F$, and $^{13}CH_3F$ have been measured at temperatures betwen 132.48 and 213.12K by differential manometric techniques in a precision cryostat. Throughout the whole temperature range of the measurements, $P(^{12}CH_3F)>P(^{12}CD_3F)$ and $P(^{12}CH_3F)<P(^{13}CH_3F)$. The data are best represented by $T\ \ln(f_c/f_g)=(2225.2\pm7.4)/T-(4.444\pm0.046)$ for the D/H effect and by $T\ \ln(f_c/f_g)=(56.58\pm2.09)/T-(0.6383\pm0.0133)$ for the $^{13}C/^{12}C$ effect. A series of calculations using Wilson's GF matrix method and a modified Schachtschneider-Snyder program resulted in temperature-dependent internal-external interactions in the liquid phase: presence of such interactions between the molecular translation in the direction of the molecular figure axis and the parallel normal modes ν_2 and ν_3 is a necessary requirement for satisfactory explanation of all isotopic vapor pressure and spectroscopic data of the liquid. The specific internal-external interactions found are consistent with the structure of CH_3F clusters obtained by ab inito molecular orbital calculations. (48 refs.)

107895 Evaporating of iron and cobalt at levitation melting. P.Kubicek, B.Wozniakova (CSAV, Ostrava, Czechoslovakia).
Kovove Mater. (Czechoslovakia), vol.21, no.4, p.467-78 (1983). In Czech.
The method of evaluation of experimental data concerning the evaporation of pure metals and binary systems for a general temperature course is analyzed. An application of radiotracers is considered for evaporation of binary systems. The process of condensation of metal vapor in the boundary layer is taken into consideration. (10 refs.)

107896 On the problem of evaporating of metals at levitation melting. P.Kubicek, B.Wozniakova (CSAV, Ostrava, Czechoslovakia).
Kovove Mater. (Czechoslovakia), vol.21, no.4, p.479-96 (1983). In Czech.
Semiempirical relations used for calculating the evaporation rate at levitation melting are compared with the theory of diffusion for a moving solid particle. The temperature field and the rate profile around the spherical particle are calculated. Theoretical conclusions are illustrated on the evaporation of iron in the flow of argon. (13 refs.)

107897 Evaporation thermodynamics of lanthanum monotelluride. S.P.Gordienko, B.V.Fenochka (Inst. of Materials-Sci. Problems, Acad. of Sci., Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.11, p.1554-8 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1811-15 (Nov. 1982).
Mass spectrometry together with chemical and X-ray analyses has given the behaviour characteristics of lanthanum monotelluride of controlled composition under vacuum at 1670-2250K. The composition and pressure of the vapor have been established, together with the type of evaporation reaction, and the enthalpies have been determined for atomisation, sublimation, and formation of solid lanthanum monotelluride, together with the dissociation energy of the gaseous form. When complete isothermal evaporation is used, an analysis may be made of the chemical composition of the specimen at various stages of evaporation. Small amounts of oxygen (up to 0.3 mass %) substantially influence the thermodynamic characteristics. Estimates have also been made of the thermodynamic functions of solid and gaseous lanthanum monotelluride at temperatures of up to 200K. (11 refs.)

107898 Vapor pressures, vaporization reactions, and thermodynamics of vaporization of VS(s). J.G.Edwards, M.Pelino, J.S.Starzynski (Dept. of Chem., Univ. of Toledo, Toledo, OH, USA).
J. Chem. Phys. (USA), vol.79, no.5, p.2351-5 (1 Sept. 1983).
Two studies of the vaporization of VS(s) were conducted in the temperature range 1770-2069K by the simultaneous Knudsen-torsion-effusion method. The vapor pressure of VS(s) was best represented by the equation $\log(P/Pa)=-(2.161\pm0.057)\times10^4K/T+11.02\pm0.29$. Limiting thermodynamic results were obtained on the basis of the assumption that the partial pressure of V(g) was the vapor pressure of V(s). The $\Delta H°$(298K) of sublimation of VS(s) to give VS(g) was 551.5±2.1 kJ/mol, of dissociation of VS(g) to give gaseous atoms was 484.5±3.3 kJ/mol, and of formation of VS(s) was −243±5 kJ/mol. The second result agrees exactly with that of a mass spectrometric study in the literature, and indicates that the temperature range of the present study is near the temperature beyond which VS(s) does not vaporize congruently. (20 refs.)

107899 Surface mechanism of nonmetal molecule formation by evaporation of the $A^{II}B^{VI}$ group crystals in vacuum. S.V.Karbovskii, Yu.V.Masyutka, G.Ya.Pikus.
Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1236-42 (Aug. 1983). In Russian.
Evaporation of $CdSe_xTe_{1-x}$ solid solution crystals of variable composition was investigated experimentally and theoretically. Evaporation of two-atom nonmetal molecules from crystals of the $A^{II}B^{VI}$ group in vacuum occurs through the stage of formation and subsequent neutralization of the 'neutral atom-surface anion' complex on the crystal surface. (14 refs.)

107900 Cloud points in ionic surfactant solutions. J.Appell, G.Porte (Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
J. Phys. Lett. (France), vol.44, no.16, p.L689-95 (15 Aug. 1983).
Experimental evidence is herein given of lower critical solution temperatures in high salt aqueous solutions of cetylpyridinium and cetyltrimethylammonium bromide, nitrate and chlorate. The critical behaviour of the solutions is followed using static and dynamic light scattering. The unique feature of this transition lies in the unusually large values of the correlation length $\xi(>10^3$ Å) more than 10°C below the critical temperature. The occurrence of the phase separation seems to be connected with the existence of giant rod-like flexible micelles in the solutions. The analogies with critical solutions of polymers are underlined. (15 refs.)

107901 Effect of H^+ on the $\beta\rightarrow\alpha$ transition in β-$LiIO_3$ after high pressure treatment. He Shou-an, Zhao You-xiang, Liu Jia-rui, Li Yin-yuan (Inst. of Phys., Acad. Sinica, Peking, China).
Acta Phys. Sin. (China), vol.32, no.4, p.466-72 (April 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)* [received: Sept. 1983]
Using the X-ray diffraction method, the authors have investigated the effects of high pressure and H^+ impregnation on $\beta\rightarrow\alpha$ transition in β-$LiIO_3$ crystals. The samples had been subjected to high pressure treatment (up to 80 kb) at room temperature and then preserved in ordinary environmental condition for different periods of time. The experimental results show that in $\beta\rightarrow\alpha$ transition in the samples treated as above the pressure can be understood to play a role of promoting the nucleation of α-phase in β-matrix, and the pressure dependence of the rate of nucleation $\dot{N}$ can be expressed in the form of $\dot{N}\propto e^{kp}$ ($k=26.8$/bar). The significant increase of quantity of α-phase in such samples may be attributed to the rapid growth of α-$LiIO_3$ nucleus under the influence of H^+ formed through the dissociation of adsorbed water molecules on the surface of α nucleus. This conclusion is supported by the similar effects in the experiment of H^+ impregnation of pressurized β-$LiIO_3$ samples. (13 refs.)

107902 The Li sites in the RT and low temperature phases of $LiKSO_4$ crystals. Meng Qing-an, Cao-juan (Inst. of Phys., Acad. Sinica, Peking China).
Acta Phys. Sin. (China), vol.32, no.4, p.525-9 (April 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)* [received: Sept. 1983]
A structural phase transition in crystal $LiKSO_4$ at $T_c=195$K was confirmed by NMR experiment previously. In this article the temperature dependence of the electric field gradient tensor at lithium site in the range of 110-300K is reported and combined with a simplified ion crystal model the crystal structure is discussed. It is shown that even in the room temperature phase, the lithium position should be at (2/3, 1/3, 0.706) instead of the position at (2/3, 1/3, 0.849) suggested previously by Bradley (1925). The phase transition is attributed to the displacement of lithium ions. The space group of the low temperature phase may be $R3$. (9 refs.)

107903 Structure transformation in mixed polycrystalline $Zn_{1-x}Cd_xS$ doped with Mn and Cu. B.Dogil, M.Grus, A.Jankowska, M.Lepek (Inst. of Experimental Phys., Univ. of Gdansk, Gdansk, Poland).
Cryst. Res. & Technol. (Germany), vol.18, no.7, p.K84-5 (1983).
Mixed compounds of $Zn_{1-x}Cd_xS$ doped with manganese (about 10^{-4} at. Mn/at.(Zn+Cd)) and copper (about 16×10^{-4} at. Cu/at.(Zn+Cd)) were

investigated. The samples were examined: (i) after preparation of polycrystalline powders; (ii) after pressing then; (iii) after heat treatment, using the EPR, X-ray, and dc conductivity methods. (no refs.)

107904 The composition dependence of the grey tin—white tin transition in dilute tin-germanium alloys. F.Vnuk, A.DeMonte, R.W.Smith (Dept. of Metall. Engng., Queen's Univ., Kingston, Ontario, Canada).
Mater. Lett. (Netherlands), vol.2, no.1, p.67-70 (July 1983).
It is shown that the temperature, T_c, at which the grey modification will convert to the white phase in dilute Sn-Ge alloys increases with the amount of germanium, according as $T_c=32.0+51.8C^{0.33}$. It is concluded that this increase in transition temperature is a hysteresis effect and is probably due to the reduced mobility of the β/α martensitic interface. (8 refs.)

107905 Influence of the interatomic long-range forces on the nature of ordering of a solid solution. A.I.Olemskoi (Polytech. Inst., Kursk, USSR).
Fiz. Met. & Metalloved. (USSR), vol.56, no.1, p.18-24 (July 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
The process of ordering of a solid solution is regarded as a redistribution of the Fermi excitations between the states described by a wave vector (see A.I. Olemskoi, ibid., vol.54, 856, 1982). An allowance is made for the interaction of the second-nearest and further neighbours and the nature of the dispersion law of excitations is determined. A study is made of the influence of dispersion on the order parameter, on the thermodynamic characteristics and on the susceptibility of the spatial structure to ordering. It is shown that an increase in the interatomic interaction radius tends to change the nature of phase transitions from the second to the first order. (7 refs.) *A.T.*

107906 Investigation of short-range order in alloy Cu_3Au. Yu.S.Stark, A.S.Shteinberg, V.I.Dimitrov (Inst. of Steel & Alloys, Moscow, USSR).
Fiz. Met. & Metalloved. (USSR), vol.56, no.1, p.53-7 (July 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
The published experimental results are used to calculate the mixing potentials and the critical temperature of an order-disorder transition. The temperature dependences of the short-range order parameters are calculated allowing for the long-range mixing potential. (3 refs.) *A.T.*

107907 Phase transition in $Hg_3In_2Te_6$. G.G.Grushka, E.D.Skulish, Z.M.Grushka (Chernovtsy State Univ., Chernovtsy, USSR).
Inorg. Mater. (USA), vol.18, no.8, p.1180-1 (Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.8, p.1388-90 (Aug. 1982).
Previous authors reported an order-disorder phase transition in the compound $Hg_3In_2Te_6$, on the basis of X-ray diffraction investigations made on single-crystal samples obtained by Bridgman's method and annealed to 500-900K for 200 h. Similar studies made by the present authors on single-crystal samples of $Hg_3In_2Te_6$ obtained by Bridgman's method and annealed at the same temperatures have confirmed the occurrence of a phase transition, but it cannot be interpreted as an order-disorder transition. It was established that synthesized and incubated single-crystals of $Hg_3In_2Te_6$ possess a purely sphalerite structure. Annealing of the samples at above 585K does not alter the form of the X-ray diffraction pattern was made of the influence of the annealing time on the structure of $Hg_3In_2Te_6$. (1 ref.)

107908 Features of structural changes accompanying the metal-semiconductor phase transition in an oxidized vanadium foil. M.F.Romanenko, Yu.I.Surov, V.Ya.Filipchenko, S.Kh.Finkel'shtein.
Inorg. Mater. (USA), vol.18, no.8, p.1191-3 (Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.8, p.1398-9 (Aug. 1982).
The results are presented of an experimental study of the structural changes in VO_2 during the phase transition. The spreading of the temperature interval ΔT and the width of the structural hysteresis loop ΔT_h are considered. The investigations were carried out on vanadium foils with a thickness equal to ~200 μ, which were oxidized under various conditions. The selection of an oxidized vanadium foil as the object of study was governed by the prospective practical use of vanadium oxide film structures, on the one hand, and the fact that such a system is convenient for the investigation of the influence of deviations from stoichiometry on the phase transition on the other hand. The features of the structural changes in the VO_2 present in a vanadium oxide layer were studied by X-ray diffraction analysis. (8 refs.)

107909 Polymorphous transformations of graphitic boron nitride of various degrees of crystalline perfection at high pressures. A.V.Kurdyumov, I.S.Gladkaya, A.S.Golubev, G.A.Dubitskii, V.N.Slesarev, G.S.Oleinik, N.F.Ostrovskaya (Inst. of High-Pressure Phys., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1576-80 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1835-8 (Nov. 1982).
It has been shown that the mechanism of the polymorphous transformations of graphitic boron nitride at high pressures, as well as their rate and the type of BN modification formed, are determined by the degree of perfection in the original structure. The three-dimensionally ordered structure of BN_g undergoes a martensite transformation in the 20-1200°C at a pressure of 11 GPa, which results in the formation of the wurtzitic modification. Under the same conditions turbostratic BN_g is characterized by a diffusional transformation with the formation of a sphalerite phase. When partially ordered BN_g is compressed, both mechanisms for polymorphous transformations are manifested. (5 refs.)

107910 Structural instability of the ZrV_2 crystal lattice. E.M.Gololobov, V.F.Malishevskii, Zh.M.Tomilo, P.A.Kofman (Inst. of Solid-State Phys. & Semiconductors, Acad. of Sci., Belorussian SSR).
Inorg. Mater. (USA), vol.18, no.11, p.1580-2 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1839-41 (Nov. 1982).
A comprehensive investigation of the low-temperature phase transition in ZrV_2 has established that the structural instability of the crystal lattice appears at a significantly higher temperature than the phase transition at which the C15 cubic lattice is transformed to rhombohedral. Results are presented of a study of the thermal expansion, specific heat, and X-ray diffraction patterns of ZrV_2 at 80-300K. (12 refs.)

107911 Effect of hydrostatic pressure on the phase transitions in $\{N(CH_3)_4\}_2XBr_4$ (X:Zn,Co). K.Gesi, K.Ozawa (JAERI, Ibaraki, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2440-2 (July 1983).
Effect of hydrostatic pressure was studied for the phase transitions in tetramethylammonium tetrabromometallic compounds, $\{N(CH_3)_4\}_2XBr_4$ (X:Zn,Co). The transition temperatures in the -$ZnBr_4$ and -$CoBr_4$ compounds (14.8°C and 14.0°C, respectively, at 1 atm) linearly increase with increasing pressure with the ratios of 0.184 deg MPa^{-1} and 0.182 deg MPa^{-1}, respectively. Any intermediate phases were not observed at high pressures up to about 200 MPa.

107912 On the phase transition in $[(CH_3)_4N]_2ZnBr_4$. R.Perret (Lab. de Dielectriques, Univ. de Dijon, Dijon, France), Y.Beaucamps, G.Godefroy, P.Muralt, M.Ehrensperger, H.Arend, D.Altermatt.
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2523-5 (July 1983).
As determined by ^{79}Br-NQR the second order transition for $[(CH_3)_4N]_2ZnBr_4$ occurs between the space groups Pnma and $P2_1/n11$ in a very broad temperature range. The enthalpy change as found from differential scanning calorimetry is in agreement with an order-disorder transition based on the mobility of tetramethyl-ammonium ions. (6 refs.)

107913 Incommensurate-commensurate phase transition in Rb_2ZnBr_4. M.Iizumi, K.Gesi (Dept. of Phys., JAERI, Ibaraki, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2526-33 (July 1983).
The existence of the successive long-period superstructures, or the 'devil's staircase', in the temperature evolution of the incommensurately modulated structure has been examined in Rb_2ZnBr_4 by the neutron diffraction method. Detailed measurements of the third order satellite scattering in the temperature region close to the incommensurate-to-commensurate phase transition have shown that the temperature evolution takes place in more complicated manners than previously reported for this compound. At least three different modulations with distinct wave numbers separated by finite gaps coexist and each of them changes continuously with temperature accompanying the change in the population of the domains corresponding to the respective wave numbers. Assignment of some part of the wave number vs. temperature curves to the stairs with fractional numbers afforded no positive evidence of the 'devil's staircase'. (17 refs.)

107914 Phase transitions in deuterated compound $\{N(CD_3)_4\}_2CuBr_4$. K.Gesi (JAERI, Ibaraki, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2534-7 (July 1983).
Effect of deuteration on the phase transitions in tetramethylammonium tetrabromocuprate crystal was studied. At 1 atm. the deuterated compound $\{N(CD_3)_4\}_2CuBr_4$ shows three phase transitions at −2°C, −31°C, and −36°C on cooling, and it is ferroelectric between −31°C and −36°C. These transition temperatures almost coincide with those in the normal compound. The pressure-temperature phase diagram of the deuterated compound is also very close to that of the normal compound. Then the effect of deuteration on the phase transitions in tetramethylammonium tetrabromocuprate crystal is negligibly small making a sharp contrast with the considerable deuteration effects in ferroelectric tetramethylammonium tetrachlorozincate and -cobaltate crystals. (7 refs.)

107915 X-ray scattering in the normal and incommensurate phases of Rb_2ZnCl_4. S.R.Andrews, H.Mashiyama (Dept. of Phys., Univ. Edinburgh, Edinburgh, Scotland).
J. Phys. C (GB), vol.16, no.25, p.4985-96 (10 Sept. 1983).
The static critical behaviour at the normal to incommensurate phase transition in Rb_2ZnCl_4 has been investigated by means of diffuse X-ray scattering. The measured values of the critical exponents γ and ν are in good agreement with theoretical estimates for the $d=3XY$ model. Measurements of the diffuse scattering in the incommensurate phase just below T_c are consistent with those expected if there are nearly gapless phase excitations. At lower temperatures an asymmetry develops in the predominantly acoustic mode scattering emanating from the primary satellite reflections which is attributed to coupling of acoustic and phason modes. The temperature dependence of the intensity of several higher-order satellites has been measured at temperatures just above the lock-in transition but is not understood. (19 refs.)

107916 Ferroelastic phase transition in $BiVO_4$: III. Thermodynamics. W.I.F.David (Clarendon Lab., Univ. of Oxford, Oxford, England).
J. Phys. C (GB), vol.16, no.26, p.5093-118 (20 Sept. 1983).
For pt.II see ibid., vol.16, p.2455 (1983). The temperature and pressure dependences of the elastic and strain-related properties of the 'pseudo-proper' ferroelectric material $BiVO_4$ have been determined using mean-field theory. In the tetragonal paraelastic phase the elastic constants c_{11}-c_{12}, c_{66} and c_{16} are all predicted to behave anomalously near T_c although none are expected to vanish. From analysis of the acoustic properties of $BiVO_4$ zero-velocity pure transverse acoustic modes are expected to propagate along the ferroelastic domain wall directions at T_c. Predicted relationships between pressure and temperature-dependent properties agree well with experimental observations. The theory also accurately predicts the ratio of secondary and primary spontaneous strains in the ferroelastic phase. (30 refs.)

107917 Ferroelastic phase transition in $BiVO_4$: IV. Relationships between spontaneous strain and acoustic properties. W.I.F.David (Clarendon Lab., Univ. of Oxford, Oxford, England).
J. Phys. C (GB), vol.16, no.26, p.5119-26 (20 Sept. 1983).
For pt.III see ibid., vol.16, p.5093 (1983). The spontaneous strain properties of the ferroelastic material $BiVO_4$ are shown to be related to its acoustic properties. At the ferroelastic phase transition temperature, it is proved that a mutually perpendicular pair of pure transverse acoustic modes possess theoretically zero velocity. The propagation and displacement directions of these modes are collinear with the ferroelastic domain walls. The monoclinic ferroelastic strain in $BiVO_4$ results from the freezing-in of the pure transverse displacements of these soft acoustic modes. (19 refs.)

107918 Ferroelastic phase transition in $BiVO_4$: V. Temperature dependence of Bi^{3+} displacement and spontaneous strains. W.I.F.David, I.G.Wood (Clarendon Lab., Univ. of Oxford, Oxford, England).
J. Phys. C (GB), vol.16, no.26, p.5127-48 (20 Sept. 1983).
For pt.IV see ibid., vol.16, p.5119 (1983). Measurements of the Bi^{3+} displacement and the primary and secondary spontaneous strains in the ferroelastic material $BiVO_4$ have been made as a function of temperature by single-crystal X-ray diffraction. The results are discussed using both macroscopic and microscopic mean-field theories of the ferroelastic phase transition. Measurements of the temperature dependence of the optical absorption edge have also been made, which show that the band-gap in $BiVO_4$ varies markedly with temperature. A method for the analysis of structural distortions in ferroelastics based on bond-length/bond-strength relationships is described. A discussion of the structural mechanism of the phase transition in $BiVO_4$ is presented, indicating that the lone-electron pair on the Bi^{3+} ion plays a prominent role. (41 refs.)

107919 Ferroelastic phase transition in $BiVO_4$: VI. Some comments on the relationship between spontaneous deformation and domain walls in ferroelastics. W.I.F.David, I.G.Wood (Clarendon Lab., Univ. of Oxford, Oxford, England).
J. Phys. C (GB), vol.16, no.26, p.5149-66 (20 Sept. 1983).
For pt.V see ibid., vol.16, p.5127 (1983). The relationship between the domain wall orientation and the spontaneous strain in ferroelastics is discussed, with particular reference to the W′ walls in $BiVO_4$. The microscopic, wall-defining property is shown to be the coherence of the lattices of the twin components. This concept, commonly used in metallurgy, is valid for both finite and infinitesimal strains and is more fundamental than the macroscopic strain compatibility condition derived by previous workers in the field of ferroelasticity. Observations of domain walls in $BiVO_4$ as a function of temperature are presented which suggest that they may be of importance in determining the properties of the material close to the ferroelastic phase transition. (33 refs.)

107920 Thermodynamics of order-disorder transformations in vanadium carbide. G.H.Emmons, W.S.Williams (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).
J. Mater. Sci. (GB), vol.18, no.9, p.2589-602 (Sept. 1983).
Some of the nonstoichiometric carbides of the transition metals (e.g. VC_x) undergo transformations to ordered phases at specific values of X. In a thermodynamic study of such order-disorder transformations the latent heats of the reactions $VC_{0.833}=V_6C_5$ and $VC_{0.875}=V_8C_7$ were measured using differential thermal analysis (DTA) and gave values of 5.7 ± 2.8 cal g^{-1} and 6.0 ± 2.4 cal g^{-1} (1 cal=4.1855 J), respectively. For well-annealed specimens intermediate in carbon-to-metal ratio between these two compositions, DTA indicated the coexistence of domains of both ordered phases. The implication is that the nonstoichiometric, disordered, NaCl-structure phase VC_x does not represent the lowest energy state of vanadium carbide at room temperature for any value of x. This result may apply to the other isomorphic carbides, i.e. TiC_x, ZrC_x, HfC_x, NbC_x and TaC_x. (26 refs.)

107921 Characterisation of the polymorphic component of 2-fluoronaphthalene. A.Meresse, P.L.Loyzance, N.B.Chanh, Y.Haget (Lab. de Cristallographie et de Phys. Cristalline, CNRS, Talence, France).
J. Phys. & Chem. Solids (GB), vol.44, no.9, p.891-7 (1983). In French.
The use of various techniques such as X-ray and neutron diffraction, Raman scattering, diffusion and calorimetry has allowed the authors to characterize the polymorphic behaviour of 2-fluoronaphthalene. Under atmospheric pressure, three crystalline forms can be detected between 80K and the melting temperature. The high temperature one, F_I, which is stable from 272K to the smelting point, is isomorphous with naphthalene (space group $P2_1/a$, $Z=2$); by cooling it can be preserved as a metastable form down to 154K, the 272-154K range being the stability domain of the form F_{III}. Below 154K, a new form, called $F_{III'}$, appears. The kinetics of the transformation $F_I \rightarrow F_{III}$ seem to be dependent upon the size of the crystals. The Raman spectra of F_I and F_{III} are identical, which suggests similar structural disorder in both phases. This is also supported by the low value of the entropy associated with the transition $F_{III} \rightarrow F_I$(0.55 J K^{-1} $mole^{-1}$). The unit cell parameters of the F_{III} and $f_{III'}$ forms have been determined from powder data using automatic indexing methods. The two solid-solid transitions are first order, the F_{III}-$F_{III'}$ one being 'explosive'. (15 refs.)

107922 Conditions for a phase transition in solids under nonhydrostatic compression. V.V.Avilov (L.D. Landau Inst. of Theoretical Phys., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.6, p.315-18 (20 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.6, p.266-9 (20 March 1983). [received: Sept. 1983]
The effect of shear stresses on the thermodynamic conditions for the appearance of nuclei accompanying a first-order phase transition in a solid is examined. It is shown that external shear stresses decrease the phase transition pressure compared to purely hydrostatic compression. (8 refs.)

107923 Stability of the martensitic phase boundaries in shape-memory alloys. E.Magyari (Inst. fur Phys., Univ. Basel, Basel, Switzerland).
J. Phys. F (GB), vol.13, no.9, p.L185-8 (Sept. 1983).
The stability of static martensitic phase boundaries (i.e. interphase interfaces or domain boundaries) in an unbounded crystal is examined in the framework of a one-dimensional Ginzburg-Landau theory. It is shown that at the three-phase coexistence temperature $T=0$ the kink-shaped boundaries interpolating the shear-strain field between the austenitic and one of the martensitic phases, as well as the phase boundaries interpolating between the martensitic domains in the two-phase sector of the model, are energetically stable. Both the pulse-shaped solitary-wave excitations of the metastable martensitic states in the one-phase sector, as well as the pulse-like excitations of the metastable austenitic state in the two-phase sector are energetically unstable. (9 refs.)

107924 Effect of pressure on the phase transition of the $[(C_6H_5)_3PCH_3]^+(TCNQ)_2^-$ anion radical salt as studied by differential thermal analysis under pressure. Y.Iida (Dept. of Chem., Faculty of Sci., Hokkaido Univ., Sapporo, Japan), K.Takamizawa.
J. Chem. Soc. Faraday Trans. I (GB), vol.79, pt.8, p.1757-63 (Aug. 1983).
The anion radical salt of $[(C_6H_5)_3PCH_3]^+(TCNQ)_2^-$, where TCNQ is 7,7,8,8-tetracyanoquinodimethane, undergoes a solid-solid phase transition at 315.7K at atmospheric pressure, where sharp discontinuities were found in the temperature dependences of the electrical conductivity and magnetic susceptibility. The effect of pressure on this phase transition has been studied by differential thermal analysis in the pressure range up to 200 MPa. The transition temperature (T_p/K) is related to the pressure (p/MPa) by the expression $T_p=315.5_8-7.2_6\times10^{-2}\,p-8.1_0\times10^{-4}\,p^2-1.1_8\times10^{-6}\,p^3$. The mechanism of the phase transition is discussed on the basis of these results together with the crystal structure data. (19 refs.)

107925 Peierls dimerization at the Jahn-Teller phase transition in $PrCl_3$. R.M.Morra, R.L.Armstrong (Dept. of Phys., Univ. of Toronto, Toronto, Ontario, Canada), D.R.Taylor.
Phys. Rev. Lett. (USA), vol.51, no.9, p.809-12 (29 Aug. 1983).
A group-theoretical analysis of chlorine nuclear quadrupole resonance data restricts to two the possible space-group symmetries of the low-temperature phase of $PrCl_3$. Consideration of this result along with experimental information on the interactions and the susceptibilities allows the transition to be identified as a Jahn-Teller Peierls dimerization. It is similar to the spin-Peierls transition but different in that the spins involved are pseudospins associated with the Jahn-Teller coupling. (16 refs.)

107926 Divergent elastic response in the commensurate charge-density-wave state of $2H$-$TaSe_2$. P.Prelovsek, T.M.Rice (Inst. fur Theoretsche Phys., Eidgenossische Tech. Hochschule-Honggerberg, Zurich, Switzerland).
Phys. Rev. Lett. (USA), vol.51, no.10, p.903-6 (5 Sept. 1983).
It is shown that the double-honeycomb textures observed in $2H$-$TaSe_2$ have an anomalous elastic compliance due to the change in relative size of different orthorhombic domains. The restoring force against this change is proportional to the domain-wall, or partial discommensuration, energy and tends to zero as the commensurate-incommensurate transition is approached giving a divergent contribution to the elastic compliance—an effect observed by Barmatz, Testardi, and di Salvo (1975) some years ago. (12 refs.)

107927 Rigid sphere model applied to the phase transitions of complex compounds of the type K_2PtCl_6. M.Krupski (Inst. of Molecular Phys., Polish Acad. of Sci., Poznan, Poland).
Phys. Status Solidi a (Germany), vol.78, no.2, p.751-8 (16 Aug. 1983).
Applying the rigid sphere model, the stability condition for structures of the K_2PtCl_6 type is formulated. The model assumes free motion of the cation as a rigid sphere within a spherical cavity with a rigid wall, consisting of 12 halogen ions. Assuming for the ionic radii values typical for twelve-fold coordination, the temperature at which the cubic K_2PtCl_6 type lattice undergoes distortion is calculated from the lattice constant in satisfactory agreement with experimental data. (35 refs.)

107928 Recent progress in commensurate-incommensurate phase transformations. J.D.Axe (Brookhaven Nat. Lab., Upton, NY, USA).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.256-62 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Three topics are discussed. (i) The nature of long wavelength excitations in $Hg_{3-\delta}AsF_6$, where gapless excitations in addition to the conventional acoustic modes are observed. (ii) Thiourea in which new commensurate phases can be induced by an external electric field. (ii) Discommensurations in $2HTaSe_2$, where recent electron diffraction and high resolution X-ray data combine with neutron results to establish a quite complex and subtle behaviour. (29 refs.)

107929 Single-crystal-polycrystalline-aggregate phase transition due to internal intercrystallite adsorption of impurities. E.M.Epshtein.
Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.91-2 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.164-5 (Jan.-Feb. 1983). [received: Sept. 1983]
Draws attention to the fact that the reduction in free energy in internal intercrystalline adsorption may compensate for the loss of free energy in the formation of an interface between the crystallites. Thus a polycrystalline state of a doped material may be thermodynamically more advantageous than a monocrystalline state. This means that prolonged annealing of a polycrystal does not necessarily lead to formation of a single crystal. A situation is also possible in which annealing leads to conversion of a single crystal to a polycrystal or to a decrease in the dimensions of the crystallites in a polycrystal. (4 refs.)

107930 Phase transitions in Bi_2WO_6 crystals. V.K.Yanovskii, V.I.Voronkova, V.A.Milyutin (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.2, p.185-7 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.316-19 (March-April 1983). [received: Sept. 1983]
The polymorphism of Bi_2WO_6 at high temperatures is investigated. The phase transition at 950-960°C involves marked changes in the crystal lattice and is reconstructive. The structure of the high-temperature phase is monoclinic, a derivative of fluorite, like the compounds $BiLnWO_6$. High-temperature X-ray diffraction also reveals a second-order phase transition at 700°C in the region of stability of the polar orthorhombic phase. None of these phase transitions is of the ordinary ferroelectric kind. The transition at 950-960°C can be regarded as pyroelectric. (18 refs.)

107931 Crystallization and phase transitions in lanthanide-α-aminoacid systems. O.K.Lezhneva, V.T.Panyushkin, N.N.Bukov (State Univ., Kuba, USSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.2, p.226-7 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.386-7 (March-April 1983). [received: Sept. 1983]
By X-ray and microscopic analysis and IR spectroscopy the authors studied the process of crystallization in the lanthanide-α-aminoacid systems, where the lanthanides were Nd and Tb, and the α-aminoacids were glycine and d-threonine. They elucidated the conditions for good crystal formation in these systems, preventing the precipitation of phases of the original components. Crystallization was effected by isothermal evaporation. Crystallization in these systems usually occurs in alkaline media. In the initial stage of the crystallization process in the systems, phases are formed with highly symmetrical packing of structural units. (3 refs.)

64.70M Transitions in liquid crystals

107932 Effect of molecular structure on mesomorphism. XVI. Nematic-isotropic thermodynamics for oligomer models of liquid crystalline polymers. A.C.Griffin, T.R.Britt (Dept. of Chem., Univ. of Southern Mississippi, Hattiesburg, MS, USA).
Mol. Cryst. & Liq. Cryst. Lett. (GB), vol.92, no.4-5, p.149-55 (1983).
For pt.XV see A.C. Griffin and S. Gorman, Analytical Chem., vol.4. Thermodynamic measurements of ΔH and ΔS for the nematic-isotropic transition for a homologous series of Siamese Twin diester liquid crystals are reported. These diesters are structurally related as conceptual dimers in the monomer→oligomer→polymer sequence of liquid crystals with a 4,4′-distributed phenyl benzoate mesogenic moiety. Both ΔH and ΔS values show an odd:even alternation with carbon number intermediate in magnitude between those for the monomeric and the polymeric mesogens. It is concluded that the Twin diesters are good models for these oligomers in the monomer→oligomer→polymer progression. (7 refs.)

107933 Anisotropic steric effects and negative $\langle P_4\rangle$ in nematic liquid crystals. K.Feng, C.-W.Woo (Dept. of Phys., Univ. of California, San Diego, La Jolla, CA, USA), P.Sheng.
Phys. Rev. A (USA), vol.28, no.3, p.1587-95 (Sept. 1983).
Starting with a model intermolecular potential that includes $\hat{\Omega}.\hat{r}$ terms to account for anisotropic steric interactions, the authors carry out a statistical mechanical calculation in the cell approximation, and apply it specifically to the isotropic-nematic transition of methoxybenzylidene butylaniline (MBBA). The potential is determined to fit the experimental transition temperature T_{IN} and the discontinuity in the orientation order parameter $\langle P_2\rangle$ at transition. $\langle P_2\rangle$ and $\langle P_4\rangle$ are then calculated from solving a set of coupled self-consistency equations for the orientational and spatial parts of the distribution function, as are other phase-transition properties. There are improvements over model calculations which do not account for anisotropic steric effects, but the improvements are generally less than significant. The most striking result is that a stable nematic phase requires $\langle P_4\rangle$ to be negative at and near the transition. It is a theoretical result qualitatively consistent with experimental data but has not been attained until now. (19 refs.)

107934 Pretransitional effects in the isotropic phase of a lyotropic nematic liquid crystal. S.Kumar, J.D.Litster (Dept. of Phys., MIT, Cambridge, MA, USA), C.Rosenblatt.
Phys. Rev. A (USA), vol.28, no.3, p.1890-2 (Sept. 1983).
The authors report quantitative observations of the pretransitional fluctuations in short-range nematic order and the divergence of the magnetic birefringence in the isotropic phase of a lyotropic liquid crystal. The results are analyzed to obtain the anisotropy of the diamagnetic susceptibility and the coefficients in a Landau expansion of the free energy. (15 refs.)

107935 Study of the phase transition in some cholesteryl and B-nor cholesteryl derivatives. I.Cuculescu (Phys. Dept., Polytech. Inst., Bucharest, Rumania), S.Selinger, R.Schwartz.
Rev. Roum. Phys. (Rumania), vol.28, no.4, p.375-9 (1983).
The phase transition has been measured by thermodielectric effect, i.e. the thermoelectrets built up in liquid crystals when cooling the samples from isotropic to solid state. By recording the current across the samples as a function of temperature it is possible to point out very exactly the temperature at which the isotropic-liquid crystal phase transition begins. (6 refs.)

107936 Electric field effects on phase transitions in mixtures of cholesteryl esters. C.Motoc, M.Honciuc (Polytech. Inst., Bucharest, Rumania).
Rev. Roum. Phys. (Rumania), vol.28, no.6, p.541-6 (1983).
The behaviour of some cholesteryl laurate-cholesteryl caprylate mixtures under electric fields is investigated by using a small angle light scattering and following morphological charges under polarized light. It was shown that the temperature corresponding to the nucleation of cholesteric spherulites is lowered by d.c. electric fields and increased by magnetic fields. The temperature shift ΔT is quadratically dependent on the field intensity in accordance to Helfrich's (1970) findings. Under electric fields important undercooling effects are induced and changes in transition temperatures such as cholesteric-smectic and smectic-solid phase were noticed. Storage effects within the cholesteric and smectic phases are induced. For the 50:50% mixture, the morphological changes induced by an electrocaloric effect are described; this occurs as a consequence of its pyroelectric behaviour. (18 refs.)

107937 Liquid crystals—a simple spectroscopic method for determining the phase transitions. D.Grasso (Istituto Dipartimentale di Chimica e Chimica Industriale, Univ. di Catania, Catania, Italy).
Spectrochim. Acta Part A (GB), vol.39A, no.8, p.689-92 (1983).
A simple method for determining the phase transitions by UV absorption spectra is described. The transition temperatures and the thermal hysteresis, for *p*-octyloxy-benzylidene-*p*′-pentyloxy-aniline (OBPA) are reported. (4 refs.)

107938 Frequency dependence of structural transitions in a smectic-*A*. P.-A.V.Kazlauskas, L.S.Klenevskis (State Pedagogical Inst., Vilnius, USSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.2, p.236 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.398-9 (March-April 1983). [received: Sept. 1983]
The formation of electrohydrodynamic instability and 'memory' of confocal and homeotropic orientation in a smectic-A liquid crystal (SLC) in an electric field have been investigated. The authors have made observations of new transitions from a confocal texture in an SLC under the influence of an electric field of definite frequency and intensity. For this purpose, they took SLC prepared from equal weights of the low-polar component 4-n-hexyloxyphenyl-4′-n-butylbenzoate and the polar component 4-nitrophenyl-4′-n-heptylbenzoate plus 0.1% of an ionic additive (pyridinium dodecyl bromide) and 3% of n-hexyloxybenzoic acid. 64.70P Glass transitions

107939 The role of TiO_2 and ZrO_2 in Na_2O-MO_2-SiO_2 glasses. D.Caferra, A.Grassi, S.Saiello, A.Buri, A.Marotta (Istituto di Chimica, Facolta di Ingegneria, Univ. di Napoli, Naples, Italy).
Mater. Lett. (Netherlands), vol.2, no.1, p.53-5 (July 1983).
The glass transition temperatures of $(1-x)Na_2O.{}^1/_2xMO_2.2SiO_2$ and $Na_2O.xMO_2.(2-x)SiO_2$ glasses, with M=Ti or Zr, have been related to the structural role and coordination of Ti and Zr. The role of network-former, intermediate or modifier of a cation has been fundamentally linked to ionic field strength; T_g values depend on ionic field strength and coordination. Titanium behaves like an intermediate oxide; its coordination ranges between four and six, depending on Ti/Si ratio. The role of zirconium changes according to the degree of substitution for Na or Si and progressively approaches that of a modifier ion. (10 refs.)

64.75 SOLUBILITY, SEGREGATION, AND MIXING

107940 Periodic precipitation of barium molybdate in silica gel. K.V.Kurien, V.K.Vaidyan, M.A.Ittyachen (Dept. of Phys., Univ. of Kerala, Trivandrum, India).
Cryst. Res. & Technol. (Germany), vol.18, no.7, p.889-94 (1983).
The mechanism of formation of the rhythmic pattern of precipitate of barium molybdate in one-dimensional Liesegang phenomenal is investigated quantitatively. The rhythmicity is found to be influenced by the molarity of inner and outer electrolytes and pH of the gel medium. The 'time-law', 'spacing-law' and 'Δx-law' are verified. (9 refs.)

107941 Studies of the mixing of glycerol in glycerol at the glycerol-vacuum interface using secondary ion mass spectrometry. W.V.Ligon,Jr. (Corporate Res. & Dev., General Electric Co., Schenectady, NY, USA).
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.2-3, p.183-7 (1 Sept. 1983).
The mixing of glycerol-d_5 in glycerol-d_8 has been found to be slow on the time scale of a typical secondary ion mass spectrometry (SIMS) experiment. Surface renewal by processes such as diffusion is therefore an insufficient explanation of the exceptional sample longevity observed for SIMS spectra of molecules in glycerol solution. Other explanations for this longevity are suggested. (4 refs.)

107942 Microprobe investigation of solid solutions in the system ZrO_2-MgO-$MgCr_2O_4$. S.G.Sennikov, G.E.Revzin (All-Union Sci.-Res. & Planning Inst. of Aluminum, Magnesium & Electrode Industry, USSR).
Inorg. Mater. (USA), vol.18, no.8, p.1163-7 (Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.8, p.1371-5 (Aug. 1982).
The existence in the system ZrO_2-MgO-$MgCr_2O_4$ of a solid solution based on zirconium dioxide was confirmed. Reaction of the components proceeds in a stepwise manner. First a binary solid solution of MgO in ZrO_2 of the cubic modification is formed; then the $MgCr_2O_4$ dissolves in this binary solution. (10 refs.)

107943 Solubility of silicon carbide in tin and gallium. Yu.M.Tairov, F.I.Raikhel', V.F.Tsvetkov (V.I. Ul'yanov Lenin Leningrad Electrical-Engng. Inst., Leningrad, USSR).
Inorg. Mater. (USA), vol.18, no.8, p.1182-3 (Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.8, p.1390-1 (Aug. 1982).
Part of an investigation carried out to study the solubility of silicon carbide in metal melts is presented. In the study of the solubility of SiC in Ga and Sn, single-crystalline 6H-SiC wafers were used. From the obtained temperature dependences of the solubility of SiC in solutions of the Ga-Si and Sn-Si systems containing 2 wt.% Si, the dissolution energies Q_{Sic} and (assuming quasi-regularity of the solutions) interaction parameters α, where $\alpha=\alpha+bT$ were evaluated. Epitaxial SiC layers were grown with a 'case'-type container used to obtain epitaxial layers of $A^{III}B^{V}$ compounds. An X-ray diffraction investigation showed that the SiC films had a single-crystalline structure. (3 refs.)

107944 Calculation of the segregation coefficient of boron in the Si-SiO_2 system. Ya.D.Nisnevich (V.I. Lenin All-Union Electrical-Engng. Inst., USSR).
Inorg. Mater. (USA), vol.18, no.8, p.1185-6 (Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.8, p.1393 (Aug. 1982).
A calculation is presented of the values of the segregation coefficient m for the case of the diffusion of boron into silicon from a doped oxide in a neutral atmosphere with the use of the dependence of the surface concentration of boron N_B on the B_2O_3 content in the doped SiO_2 obtained on the basis of a thermodynamic analysis of the reaction of boron oxide with silicon. (4 refs.)

107945 Kinetics of the decomposition of a solid solution of aluminium antimonide in germanium. R.A.Akopyan, A.A.Abdullaev, S.Kh.Mamedova (Moscow Electrical Engng. Inst., Moscow, USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1518-21 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1769-71 (Nov. 1982).
The decomposition of a complexly doped solid solution of donors and acceptors in germanium, introduced in equiatomic amounts, was investigated by the methods of measurement of the microhardness and Hall effect. A sharp slowdown of the decomposition process was detected and is attributed to a slowing of the diffusion process on account of the formation of donor-acceptor complexes of the (AlSb)° type. (3 refs.)

107946 Study of complex coacervation in low concentration by virial expansion method. II. Salt-containing systems. K.-i.Tainaka (Dept. of Phys., Ibaraki Univ., Ibaraki, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2603-9 (July 1983).
For pt.I see ibid., vol.46, p.1899 (1979). In a recent paper, the author developed a thermodynamic theory on the complex coacervation in the absence of low molecular ions, under the assumption that the coacervation is a condensation phenomenon of the aggregate of a polyanion and a polycation in aqueous solution, by obtaining the interaction potential U between these aggregates. In the present paper, the theory has been extended to a more complicated-phenomenon in salt-containing solutions. The phase separation of this three-component system is analyzed by a new method. This treatment has modified the interaction potential U. It has been found that the presence of salts not only suppresses in most cases but also enhances the coacervation in some cases. (12 refs.)

107947 Second phase development in Sr-doped TiO_2. H.C.Ling (Engng. Res. Center, Western Electric, Princeton, NJ, USA), M.F.Yan.
J. Mater. Sci. (GB), vol.18, no.9, p.2688-96 (Sept. 1983).
In the Ti-rich region of the SrO-TiO_2 system, a temperature-composition range is found to exhibit limited solubility of strontium, the maximum limit being 0.5 mol.% Sr. It is also found that a two-phase region exists between this solubility limit and $SrTiO_3$, in agreement with existing phase diagrams. When the strontium concentration is small (≥0.5 mol.%), strontium segregates to the grain boundaries to form a second phase of $SrTiO_3$ below the solubility limit. Above 1200°C, this second phase is continuous; shape instability causes it to break up into discrete particles below 1200°C. At higher strontium concentration (about 2 mol.% Sr), nucleation of $SrTiO_3$ crystallites occurs both inside the TiO_2 grains and at the grain boundaries. The morphology of these crystallites after long time annealing suggests that the 110 plane has the fastest growth rate. The appropriate range of composition and heat treatment to form a continuous $SrTiO_3$ grain boundary layer is discussed in relation to the optimum heat treatment to develop the best nonlinear electrical properties of varistor devices. (15 refs.)

107948 Mixing of phases in non-crystalline materials: Application to carbon. G.C.Summerfield (Dept. of Nuclear Engng., Univ. of Michigan, Ann Arbor, MI, USA), D.F.R.Mildner, J.M.Carpenter.
J. Non-Cryst. Solids (Netherlands), vol.57, no.2, p.289-303 (1 Sept. 1983).
The atomic structure of non-crystalline solids is described by the correlation function. When more than one phase is present, the simple addition of the correlation functions for the various phases in proportion to their concentrations within the system is not valid, except in the case of the completely phase-separated system. The overall correlation function must reflect the boundaries between the various phases within the system. The cross correlation functions between the phases have a dependence both on the degree of mixing of the phases and also on the sizes of the domains of the phases. The correlation function for a non-crystalline solid with more than one phase has been derived in a general way. Particular application has been made to non-crystalline carbon for which the correlation function given previously did not have the correct limits because of absence of the cross correlation terms. (18 refs.)

107949 Solubility of hydrogen and deuterium at low concentration in $Fe_{0.5}Ti_{0.5}$. J.-M.Welter, G.Arnold, H.Wenzl (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany).
J. Phys. F (GB), vol.13, no.9, p.1773-84 (Sept. 1983).
The concentrations of hydrogen and deuterium dissolved in $Fe_{0.5}Ti_{0.5}$ in equilibrium with the gas (pressure range, 0-120 bar; temperature range, 400-800K) were determined by electrical resistivity measurements. For both isotopes the electrical resistivity increases by 820 $\mu\Omega$ cm per unit concentration of x in $Fe_{0.5}Ti_{0.5}H_x/D_x$. Hydrogen and deuterium dissolve endothermically, and Sieverts' law is satisfied up to the highest obtainable concentration ($x\sim0.03$). For $Fe_{0.5}Ti_{0.5}H_x$ the x-p-T relation (with p in bar, T in K) is $\log_{10}x={}^1/_2\log_{10}p-1.86-556/T$. The partial molar enthalpies and excess entropies of solution at infinite dilution exhibit only a small isotope dependence. The solvus concentration of the solid solution $Fe_{0.5}Ti_{0.5}H_x$ is $\log_{10}x=1.1-1340/T$. (32 refs.)

107950 Hydrogen induced lattice expansion in nickel. G.J.Thomas (Sandia Nat. Labs., Livermore, CA, USA), W.D.Drotning.
Metall. Trans. A (USA), vol.14A, no.8, p.1545-8 (Aug. 1983).
The volume expansion due to low concentrations of dissolved hydrogen in nickel has been measured by observing the length change during isothermal desorption of precharged samples. The present measurements indicate a much smaller expansion than found previously in cathodically charged nickel. The lattice relaxation per hydrogen atom was measured to be 0.13±0.03 atomic volumes, compared to 0.28 at. vol. from the single previous determination. Measurements were also made of the hydrogen induced volume expansion in niobium to verify the experimental technique. Good agreement with literature values was found in this metal. (12 refs.)

107951 Critical fluctuations in a binary polymer mixture. C.Herkt-Maetzky, J.Schelten (Inst. fur Festkorperforschung, Kernforschungsanlage Julich, Julich, Germany).
Phys. Rev. Lett. (USA), vol.51, no.10, p.896-9 (5 Sept. 1983).
The critical opalescence of a binary polymer mixture consisting of polyvinyl methyl ether and deuterated polystyrene was measured by small-angle neutron scattering. In accordance with a mean-field treatment, it was found that the critical exponents ν and γ are 0.5 and 1, respectively; the Ornstein-Zernike scaling function describes the scattering data; and the spinodal is parabolically shaped. However, the dependence of the interaction parameter χ on the composition of the polymer mixture is in conflict with the theoretical result. (10 refs.)

107952 On the identification of new and normal phases in the system of cadmium-antimony alloys. A.A.Mohamed (Dept. of Phys., Ain Shams Univ., Cairo, Egypt), S.A.Saleh, E.A.Abou-Saif, M.Abd-Rabo, G.A.El-Ganainy.
Phys. Status Solidi a (Germany), vol.78, no.2, p.705-16 (16 Aug. 1983).
A set of Cd-Sb alloy samples of concentrations 7, 20, 37, 48, 50, 52, and 70 at.% Sb are prepared in evacuated silica tubes at 900°C. The X-ray diffraction analysis of some annealed samples shows a metastable phase, which is not previously identified by other workers. After studying decomposition and its crystal structure this phase is given the chemical formula Cd_5Sb_4 and a unit cell of orthorhombic shape with dimensions of 0.7309, 0.5427, and 0.506 nm for a, b, and c, respectively. The other phases Cd, Sb, CdCb, and Cd_4Sb_3 are identified in both quenched and annealed samples. Electron diffraction and metallurgical studies are used in the identification. Contradictions in the phase diagram of the Cd-Sb system are discussed. (15 refs.)

107953 Spinodal decomposition in Fe-Cr alloys studied by small angle neutron scattering. M.Furusaka, Y.Ishikawa (Phys. Dept., Tohoku Univ., Sendai, Japan), S.Yamaguchi, Y.Fujino.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.383-6 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The spinodal decomposition process in $Fe_{1-x}Cr_x$ has been studied by small angle neutron scattering for $x=0.2$, 0.3, 0.4 and 0.6. The spinodal and magnetic phase diagrams have been determined by measuring the critical scattering. The temporal variation of the scattering functions $S(k,t,T_a)$ has been studied at room temperature, after the sample had been annealed at T_a for a time interval t, followed by quenching. A remarkable result is that $S(k,t,T_a)$ of $Fe_{0.6}Cr_{0.4}$ and $Fe_{0.7}Cr_{0.3}$ are almost identical for the same annealing temperature, in spite of the fact that $Fe_{0.7}Cr_{0.3}$ was annealed above the spinodal line. This fact, together with the observation that $S(k,t,T_a)$ converges into the Lorentzian $c/(\kappa^2(T)+k^2)$ with very small $\kappa(\kappa^2\leq0.01\ A^{-2})$, is explained well by the recent nonlinear theories of Langer or Saito. (12 refs.)

107954 Phase separation and defects in crystals studied by small-angle neutron scattering. G.Kostorz (Inst. fur Angewandte Phys., ETH Zurich, Zurich, Switzerland).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.387-91 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Recent applications of small-angle scattering of neutrons to study alloy properties and microstructure are discussed. Results on the decomposition of Au-60 at.% Pt, on precipitate states in Al-6.8 at.% Zn and Ni-(12-14) at.% Al single crystals and on the dissolution of coherent precipitates in fatigued Cu-2 at.% Co single crystals are presented. (22 refs.)

107955 Decomposition kinetics in iron-chromium alloys. S.Katano, M.Iizumi (Div. of Phys., Tokai Res. Est., JAERI, Ibaraki, Japan).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.392-6 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The decomposition kinetics of Fe-Cr alloys aged at several temperatures have been investigated over a wide composition range by means of neutron small-angle scattering. The concentration and aging temperature dependence of time evolution of the scattered intensity are compared with predictions of recent theories and computer simulations. The experimental results show that the decomposition kinetics have much more complicated aspects than the results

of the theories and the computer simulations although several essential features of the kinetics are explained by these predictions. (9 refs.)

107956 Decomposition process in Al-Zn and Al-Zn-Mg alloys. S.Komura, K.Osamura, H.Fujii, T.Takeda (Faculty of Integrated Arts & Sci., Hiroshima Univ., Hiroshima, Japan).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.397-400 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Neutron small angle scattering from binary alloys Al-6.8% Zn and Al-10% Zn and energy alloys with a further addition of 0.1% Mg quenched from the homogeneous phase into the decomposing phase and aged at various temperatures was measured. The results show that the effect of aging at higher temperature is equivalent to that at lower temperature for a longer period especially for the ternary alloys. This is the indication that the decomposition process is mainly governed by the diffusion process of the atoms. (6 refs.)

107957 Weak-beam electron microscopy of radiation-induced segregation. H.Saka (Dept. of Metall., Nagoya Univ., Nagoya, Japan).
Philos. Mag. A (GB), vol.48, no.2, p.239-50 (Aug. 1983).
The segregation of solute atoms to dislocations during irradiation by 1 MeV electrons in a HVEM was studied by measuring the dissociation width of extended dislocations in Cu-5.1 at.% Si, Cu-5.3 at.% Ge, Ag-9.4 at.% In and Ag-9.6 at.% Al alloys. 'Weak-beam' electron microscopy was used. In Cu-Si (oversized solute), Cu-Ge (oversize) and Ag-Al (undersize), solute enrichment was observed near dislocations, while in Ag-In (oversize) solute depletion was observed. The results are discussed in terms of current mechanisms for radiation-induced segregation. (10 refs.)

107958 Interaction between platinum and melts of compounds containing bismuth oxides. V.V.Mechev, V.A.Kutvitskiy, A.F.Shimanskiy.
Russ. Metall. (GB), no.3, p.37-40 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.40-3 (1982).
A mechanism is proposed for the reactions between platinum and melts of bismuth germanate and zincate. Experimental results are given on the kinetics of dissolution of Pt in these melts in the range 1123-1373K. The rate constants and energy chracteristics of the interactions between platinum and $Bi_{12}GeO_{20}$ and $Bi_{12}ZnO_{19}$ melts are calculated. (6 refs.)

107959 Solubility of GaAs in Au-Ge eutectic melts [ohmic contacts]. W.E.Stanchina (Dept. of Electrical Engng., Univ. of Notre Dame, Notre Dame, IN, USA), J.M.Whelan.
Solid-State Electron. (GB), vol.26, no.8, p.817-19 (Aug. 1983).
The gold-germanium eutectic compound (88 w/o Au-12 w/o Ge) has been widely used in making ohmic contacts to gallium arsenide (1977). Specific contact resistances as low as $1\times10^{-6}\ \Omega-cm^2$ have been reported by Shiota et al. (1977). Alloying the GaAs/Au-Ge above the Au-Ge eutectic temperature of 356°C is an integral part of the ohmic contact fabrication. Therefore solubilities of GaAs in the liquid Au-Ge are quite important in determining the nature of the alloy. Otsubo et al. (1977) have studied these solubilities for the temperature range 450-650°C. The study described in this paper was conducted to extend GaAs in Au-Ge solubility data to lower temperatures which are more typical of those used to make device type contacts. (14 refs.)

107960 Stability and solubility of sphalerite in alkaline hydrothermal solutions. V.A.Kuznetsov, D.V.Kostomarov (Inst. of Crystallography, Acad. of Sci., USSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.83-5 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.151-5 (Jan.-Feb. 1983). [received: Sept. 1983]
The authors study phase formation in the $ZnS-KOH-H_2O$ system and determine the region of stability of sphalerite between 300 and 500°C. They identify a new phase $K_2Zn_3S_4$. They show that when ZnS dissolves in dilute KOH solutions it preferentially forms the complex $ZnS(OH)^-$, but in concentrated solutions it forms $Zn(OH)_4{}^{2-}$. (12 refs.)

107961 On the dissolving of polymers and photoresists. A.Grossmann, L.Pohlmann (Zentralinst. fur Phys. Chem. der Acad. Wissenschaften, Berlin, Germany).
Z. Phys. Chem., Leipzig (Germany), vol.264, no.4, p.831-5 (1983). In German.
A model of the physico-chemical dissolving of photoresists and polymers is presented. According to the model a layer of constant thickness is formed at the surface of the polymer, which is permeable to the solvent. Diffusion of the solvent through this layer causes a delay in dissolution which has been experimentally observed. Model and experimental results are compared. (6 refs.)

107962 The migration, precipitation and dissolution of solute atoms in quenched Al-Ge, Al-Sn, and Cu-Ge alloys. I.Kanazawa, H.Murakami, T.Kurihara, T.Shimizu, T.Kusaka (Dept. of Phys., Tokyo Gakugei Univ., Tokyo, Japan) T.Iwashita, M.Doyama.
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.493-5
Ageing behaviour of vacancies and Ge in quenched Al were studied by the positron annihilation Doppler broadening method. The dissolution of small unstable clusters of Ge atoms-vacancies were observed at relatively low temperatures. During the Ge precipitation, it was made clear that vacancies condense on incoherent Ge precipitates/matrix interfaces. Some tendency was observed in Al-Sn alloys. The study on quenched Cu-Ge alloys was also reported. (8 refs.)

64.80 OTHER PHASE PROPERTIES OF SYSTEMS

107963 Influence of crystallisation conditions on the size of cellular and cellular-dendritic substructure. V.O.Esin, V.B.Vorontsov (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).
Cryst. Res. & Technol. (Germany), vol.18, no.7, p.933-8 (1983).
A relationship is shown to exist between the size of the cellular-dendritic substructure and the growth conditions. The dependence of the cell diameter on the crystallisation rate is non-monotonic, having a maximum in the region of low solidification rates. Theoretical calculations are compared with experimental data. (16 refs.)

107964 Homogeneity region of neodymium-gallium garnet. B.V.Mill', A.V.Butashin (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
Inorg. Mater. (USA), vol.18, no.8, p.1186-8 (Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.8, p.1394-5 (Aug. 1982).
The existence of a homogeneity region for the rare-earth gallium garnets $Ln_{3+x}Ga_{5-x}O_{12}$ (Ln denotes Pr-Lu and Y) as a result of the replacement of some of the octahedral Ga^{3+} ions by Ln^{3+} has been noted previously. The problem of nonstoichiometry was investigated in greatest detail for gadolinium-gallium garnet, whose congruent melt contains Gd_2O_3 and Ga_2O_3 in a 3.05:4.95 mole ratio (61.87 mole % Ga_2O_3). The homogeneity region of NGG in Czochralski-grown single crystals and in solid-phase reactions was studied. (9 refs.)

107965 X-ray diffraction study of nonstoichiometry with respect to oxygen in cobalt ferrospinel. V.I.Fadeeva (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
Inorg. Mater. (USA), vol.18, no.8, p.1196-8 (Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.8, p.1402-3 (Aug. 1982).
The nonstoichiometry with respect to oxygen in $Co_xFe_{3-x}O_{4+\gamma}$ for $x \leq 1$ corresponds to an appreciable oxygen excess, which decreases with increasing cobalt content. The growth of single crystals of ferrites from melts does not guarantee uniqueness of the chemical composition and properties of the samples obtained. The samples have not only different cationic compositions, but also different oxidation states of the ferrospinels. Such single crystals are of interest for X-ray diffraction investigations. The single-phase nature of the samples was established by X-ray diffraction analysis, and the lattice constants are equal to 0.8389 and 0.8386 nm for the first and second samples, respectively. The nonstoichiometry of the crystal is due to the formation of point defects of the vacancy or interstitial-ion types. The investigations of the structural realization of the oxygen nonstoichimetry in spinels reduces to the measurement of the mean-square static displacements of the ions $\bar{u}_{(i)}^2$ for each of the three sublattices. (6 refs.)

107966 Microstructure and microanalysis of bismuth molybdates. P.L.Gai (Dept. of Metall. & Sci. of Materials, Univ. of Oxford, Oxford, England).
J. Solid State Chem. (USA), vol.49, no.1, p.25-42 (Aug. 1983).
The microstructures of commercially important bismuth molybdate catalysts in relation to olefin oxidation reactions are examined by electron microscopy (EM) techniques. The microstructural characterization has been carried out using dynamic (in situ) EM, high resolution EM, and microanalysis. The coprecipitated catalyst system Bi_2MoO_6 or γ, together with the γ phase, contains small amounts of tetragonal Bi_2MoO_6 phase, $Bi_2Mo_3O_{12}$ (α phase), Bi_2O_3, and MoO_3. In reduction with propylene, at catalyst operating temperatures of 400-500°C, in the dynamic experiments conducted on α- and γ-phase crystallites under reaction conditions no evidence for extended defects such as crystallographic shear planes has been obtained; instead an ordered intermediate phase similar to (101) $Bi_2Mo_2O_9$ (β-phase) is observed which is found to be unstable. Observations by electron microscopy have been confirmed with parallel measurements made in a reactor connected to a gas chromatograph and mass spectrometer system. The possible influence of the microstructural changes on the catalytic behavior of the system is examined. (30 refs.)

107967 Neutron diffraction topographic observation of substructures in Cu-based alloys. H.Tomimitsu, K.Doi (Phys. Div., JAERI, Ibaraki-ken, Japan), K.Kamada.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.96-102 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Neutron diffraction topography was applied to the direct observation of the substructure in a Bridgman-grown Cu-14%Ni single crystal with the growth direction nearly parallel to [111]. The observed substructure consists of bundles of rods extending throughout the crystal along the [001] direction, every rod having a square-shaped cross section of about 1 mm^2 and being arrayed regularly in both the (100) and (010) planes. This conclusion is discussed in comparison with previous results for Cu-5%Ge. (3 refs.)

107968 Structure and non-stoichiometry of calcium aluminates. H.Schmid, L.C.De Jonghe (Materials & Molecular Res. Div., Lawrence Berkeley Lab., Berkeley, CA, USA).
Philos. Mag. A (GB), vol.48, no.2, p.287-97 (Aug. 1983).
Lattice imaging of reaction-sintered ceramic compounds in the $CaO-Al_2O_3$ system showed 00.1 syntactic intergrowths in the matrix $CaO.6Al_2O_3$ phase. The structure of these intergrowths could be interpreted in terms of the concepts used to describe various magnetoplumbite phases (Braun 1957). The observed formation of syntactic phases reveals that calcium aluminates can accommodate calcium oxide/alumina non-stoichiometry in a relatively wide range by altering the stacking sequence of three sub-unit cell 00.1 slabs. (18 refs.)

64.90 OTHER TOPICS IN EQUATIONS OF STATE, PHASE EQUILIBRIA, AND PHASE TRANSITIONS

107969 Experimental evidence of a phase transition in a microcluster. A.J.Stace (Dept. of Chem., Univ. of Southampton, Southampton, England).
Chem. Phys. Lett. (Netherlands), vol.99, no.5-6, p.470-4 (19 Aug. 1983).
Experiments on the unimolecular decomposition of ion clusters of the type $Ar_n.(CH_3)_2O^+$ to form $Ar_n.CH_3OCH_2{}^+$ and $Ar_n.CHO^+$, show the total product ion intensity to be sensitive to the stagnation pressure behind the expansion nozzle. At sufficiently low pressures it is possible to form $Ar_n.(CH_3)_2O^+$ clusters alone with no evidence of any product ions. As the nozzle pressure is increased so the total product ion intensity is observed to increase also. These results are interpreted in terms of the argon component of the cluster undergoing a transition from a liquidlike to a solidlike state. (27 refs.)

65.20 HEAT CAPACITIES OF LIQUIDS

107970 Determination of the thermodynamic properties of water from measurements of the speed of sound in the temperature range 251.15-293.15K and the pressure range 0.1-350 MPa. J.P.Petitet, R.Tufeu, B.Le Neindre (Univ. Paris-Nord, Villetaneuse, France).
Int. J. Thermophys. (USA), vol.4, no.1, p.35-50 (March 1983).
The speed of sound in water has been measured in a broad region around the liquid-solid transition, that is in the temperature range from 251.15K to 293.15K and in the pressure range from 0.1 to 350 MPa. An iterative method of calculation was used to determine the thermodynamic properties in the same *P-T* diagram. Anomalies observed for the isothermal compressibility and the specific heat at constant pressure are discussed in terms of statistical mechanical considerations. (20 refs.)

107971 Critical heat capacity in a 3-methylpentane+nitroethane mixture near its consolute point. G.Sanchez, M.Meichle, C.W.Garland (Dept. of Chem., MIT, Cambridge, MA, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1647-53 (Sept. 1983).
A computerized high-resolution AC calorimetric technique has been used to measure the heat capacity C_{px} of a critical 3-methylpentane+nitroethane binary-liquid mixture. An analysis of these results yields universal parameters in good agreement with those expected for the $d=3$, $n=1$ (three-dimensional Ising) universality class. The critical exponent $\alpha=\alpha'$ lies in the range 0.11-0.12, the ratio A'/A of the amplitudes of the leading singularity in C_{px} above and below T_c is 1.79 ± 0.06. The ratio of the corrections-to-scaling amplitudes D'/D is ~ 1. The quantity $A_v \xi_0{}^3/k_B$, which relates the critical amplitude of the heat capacity to that of the correlation length, is also in agreement with the renormalization-group value for the three-dimensional Ising model as expected from two-scale-factor universality. (24 refs.)

Thermophysical characteristics of aprotonic solvents and electrolytes based on them .... See Entry 108079

65.40 HEAT CAPACITIES OF SOLIDS

(for specific heat of superconductors, see 74.30E; for specific heat of magnetic systems, see 75.40)

107972 Critical behavior in the heat capacity of ferroelectric TGS, TGSe, and TGFB. K.Ema (Dept. of Phys., Tokyo Inst. of Technol., Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2798-809 (Aug. 1983).
Measurements of the heat capacity were carried out on TGS, TGSe, and TGFB with an AC calorimetry technique to clarify its critical nature near the ferroelectric phase transition point. An anomalous heat capacity with logarithmic temperature dependence was found in all of the three crystals in a temperature range $T-T_c<10\sim20$K above T_c. The relation between this anomaly and the quality of sample was studied by examining crystals of different growth conditions. The effect of γ-ray irradiation on this anomaly was also examined to critcal fluctuation. The data are analyzed with a theory for an Ising-dipole system taking into account the effect of fluctuation to the first order. The observed heat capacity anomaly both above and below T_c is fitted satisfactorily with reasonable values of parameters. (40 refs.)

107973 Thermal conductivity of LiF containing dislocations at low temperatures. A.Kumar, A.K.Sinha, M.A.Ansari (Dept. of Phys. & Meteorology, Indian Inst. of Technol., Kharagpur, India).
Phys. Status Solidi b (Germany), vol.118, no.2, p.483-91 (1 Aug. 1983).
The thermal conductivity at very low temperatures of LiF crystals containing dislocations are analysed by using the Callaway model, Callaway's approximations, and approximations suggested by Kumar and Joshi (1971). It is found that the contribution of the effective phonon-dislocation scattering processes to the lattice thermal conductivity can be calculated by suitably combining the static and the dynamic phonon-dislocation scattering processes. (21 refs.)

107974 Specific heat of a K_2SeO_4 single crystal in the temperature range 0.6 to 7K. I.Henning, E.Hegenbarth (Section of Phys., Tech. Univ. Dresden, Dresden, Germany), B.Brezina.
Phys. Status Solidi a (Germany), vol.78, no.2, p.K167-70 (16 Aug. 1983).
The specific heat of a K_2SeO_4 single crystal was measured in the ferroelectric phase. The specific heat was measured by the heat-pulse method in a ^{3}He cryostat in the temperature range of 0.6 to 7K. (9 refs.)

107975 Thermal properties of a Bi_2O_3:Y_2O_3 oxygen conductor at low temperature. W.N.Lawless (CeramPhys. Inc., Westerville, OH, USA), S.L.Swartz.
Phys. Rev. B (USA), vol.28, no.4, p.2125-9 (15 Aug. 1983).
Specific-heat and thermal-conductivity measurements (1.7-40K) are reported for the first time on a Bi_2O_3:Y_2O_3 oxygen conductor having a stabilized, defect-fluorite structure. Glasslike behavior is found in the properties measured, and the magnitudes of the coefficients involved are very similar to those found in amorphous materials. The thermal conductivity has a plateau region ~20-30K and a T^2 temperature dependence below ~3K. The specific heat has a maximum in C/T^3 at 12K describable by a single Einstein term (ω=33.1 cm^{-1}) and a linear tunneling term resolvable below 3.5K. The fitted Debye temperature is 248.9K (±0.4%). This oxygen conductor has a large concentration of oxygen vacancies at elevated temperatures, but the Einstein term indicates that the majority of these vacancies is ordered at low temperatures. Using the vacancy concentrations from the Einstein term, the authors find excellent agreement with the theory of McWhan et al. (1977) for the coefficient of the tunneling term. Comparisons are made with the low-temperature properties of stabilized zirconias and the alkali-metal β-aluminas. (18 refs.)

107976 Multiple specific heat anomalies at the neutral-ionic phase transition in TTF-chloranil. C.Ayache (Service des Basses Temperatures, CENG, Grenoble, France), J.B.Torrance.
Solid State Commun. (USA), vol.47, no.10, p.789-93 (Sept. 1983).
The specific heat has been measured for the mixed stack organic compound TTF-chloranil from 10 to 300K. Both protonated and deuterated samples exhibited a large specific heat anomaly in the region of the neutral-ionic phase transition near 84K. This anomaly has very peculiar form, composed of a number of sharp peaks. In one sample, three very sharp, symmetric peaks were observed. Based on these specific heat data alone, it is difficult to determine the order of the phase transition. Complimentary measurements, however, that combine differential thermal analysis and cycling appear to rule out a simple first order phase transition. Significant and uncontrolled changes in c_p of unknown origin are observed and prevent a more quantitative analysis of the data. (18 refs.)

107977 Low-temperature specific heat of USb and UTe. H.Rudigier, Ch.Fierz, H.R.Otto, O.Vogt (Lab. fur Festkorperphys., ETH-Honggerberg, Zurich, Switzerland).
Solid State Commun. (USA), vol.47, no.10, p.803-6 (Sept. 1983).
The authors have measured the low-temperature specific heat c_p of single-crystalline samples of USb and UTe between 0.1 and 12K. From the experimental data they deduce values for the electronic specific-heat parameter γ of 0.2 mJ/mole K^2 and 10.3 mJ/mole K^2 for USb, and UTe, respectively. c_p data below 1K reveal the onset of nuclear specific heat with decreasing temperature. In temperature range, this contribution is much stronger for USb than for UTe. (22 refs.)

107978 Thermal conductivity and thermal capacity of glow discharge polymers. P.Fritzsch (Sektion Phys., Tech. Hochschule Karl-Marx-Stadt, Karl-Marx-Stadt, Germany).
Wiss. Z. Tech. Hochsch. Karl-Marx-Stadt (Germany), vol.25, no.2, p.197-203 (1983). In German.
Organic glow discharge polymers have a series of different properties which distinguish them from other polymers. The most important are thermal capacity and conductivity. Thermal capacity was measured between 1.5K and 36K. The specific heat capacity variations of phthalodinitril, malonic acid dinitril and chlorobenzol are given in the form of curves and the quantitative results of measurement are discussed. An attempt is made to explain the specific properties of these polymers by their chemical and atomic structure. The empirical results appear to agree well with theoretical considerations. 65.50 THERMODYNAMIC PROPERTIES AND ENTROPY

107979 Note on the use of the Krupkowski relation in the thermodynamic study of A^{III}-B^{V} systems. V.Flemr, B.Hajek (Dept. of Inorganic Chem., Prague Inst. of Chem. Technol., Prague, Czechoslovakia).
Cryst. Res. & Technol. (Germany), vol.18, no.7, p.K71-2 (1983).
The authors point to the inconsistency of the Krupkowski relation with the stability condition for solutions. The types of solutions for which it can be used are exceptional. (3 refs.)

107980 Krupkowski's formalism and the stability condition for homogeneous phases. G.Knobloch, R.Apelt, E.Butter (Sektion Chem., Karl-Marx-Univ., Leipzig, Germany).
Cryst. Res. & Technol. (Germany), vol.18, no.7, p.K73-4 (1983).
To render a possible numerical approach to mixed phases, we are constrained to use more or less empirical relations for the description of the thermodynamic excess properties. One of them is the Krupkowski formalism. Flemr and Hajek (1983) dissuade from the use of this statement because, in their opinion, the stability condition for homogeneous phases in the infinite diluted region should be not fulfilled. However, their argumentation is based on an incorrect mathematical treatment of the stability criterion. The present authors conclude that homogeneous 'Krupkowski mixtures' are stable against phase decomposition in the regions of infinite dilution if $m>1$. The application of Krupkowski's formalism supposes the acceptance of this restriction. (4 refs.)

107981 Enthalpies of formation of Au-Ge and Au-Ag-Ge liquid alloys at 1373K. S.Hassam, M.Gaune-Escard (Lab. de Dynamique et Thermophys. des Fluides, Univ. de Provence, Marseille, France), J.P.Bros.
High Temp. Sci. (USA), vol.16, no.2, p.131-51 (April 1983). [received: Sept. 1983]
The enthalpies of formation of gold-germanium and gold-silver-germanium alloys were measured at 1373K over the entire concentration range. A high temperature calorimeter with a graphite resistance heater was used for the investigation. The detector consisted of 25 [(Pt-6% Rh) vs. (Pt-30% Rh)] thermocouples. The concentration dependence of the ternary enthalpies of mixing was satisfactorily represented by a polynomial relation. (31 refs.)

107982 Gadolinium monophosphide at elevated temperatures. S.P.Gordienko, V.F.Gol'nik, K.E.Mironov (Inst. of Problems in Materials Technol., USSR).
Inorg. Mater. (USA), vol.18, no.9, p.1233-6 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1448-51 (Sept. 1982). [received: Sept. 1983]
Mass spectrometric, chemical, X-ray diffraction, and differential thermal analyses were used to study gadolinium monophosphide under vacuum at high temperatures. The gadolinium monophosphide was found to dissociate at 2080-2465K to atomic gadolinium, phosphorus, and molecules of P_2. The van't Hoff and Gibbs-Helmholtz equations were used to determine the standard enthalpy of atomization from gadolinium monophosphide at $\Delta H_{at}{}^0(298)=1027.3$ kJ/mole and the standard enthalpy of the monophosphide formation as $\Delta H_f{}^0(298)=-313.8$ kJ/mole. (10 refs.)

107983 Partial molar volumes and partial molal adiabatic compressibilities of nitroamminecobalt(III) complexes in water at 25°C. F.Kawaizumi, K.Matsumoto, H.Nomura (Dept. of Chem. Engng., Nagoya Univ., Nagoya, Japan).
J. Phys. Chem. (USA), vol.87, no.16, p.3161-6 (4 Aug. 1983).
Densities and ultrasonic propagating velocities of aqueous solutions of a series of nitroamminecobalt(III) complexes have been measured at 25°C at concentrations less than 0.1 mol kg^{-1}. Partial molar volumes, $\bar{V}_2{}^\circ$, have been determined by extrapolation of the relationship between ϕ_v-$S_v m^{1/2}$ and m, where S_v is the coefficient given by the Debye-Huckel (DH) theory. In this relationship, nearly horizontal slopes have been observed for all samples. Infinite-dilution values of partial molal compressibility, $\phi_{Ks}{}^\circ$, have been evaluated from the linear extrapolation of the empirical plot of ϕ_{Ks} against $m^{1/2}$. The concentration dependence of ϕ_{Ks} of these complexes is much higher than those observed for ordinary electrolytes of the same valency type. Values of $\bar{V}_2{}^\circ$ and $\phi_{Ks}{}^\circ$ assigned to the complex ions $[Co(NO_2)_n(NH_3)_{6-n}]^{3-n}$ increase regularly with the number of the ligand $NO_2{}^-$ contained in the complex. Analysis of the observed variation of $\bar{V}_2{}^\circ$ and $\phi_{Ks}{}^\circ$ of complex ions has shown that even for nonelectrolytic complex $[Co(NO_2)_3(NH_3)_3]^0$, electrostriction should occur in solution. (24 refs.)

107984 High temperature thermodynamics of H_2 and D_2 in titanium, and in dilute titanium oxygen solid solutions. P.Dantzer (CNRS-ERA, Univ. of Paris-Sud, Orsay, France).
J. Phys. & Chem. Solids (GB), vol.44, no.9, p.913-23 (1983).
The Tian Calvet microcalorimetric method has been improved in order to determine $\Delta H_H(d)$, the partial molar enthalpy of mixing of hydrogen (deuterium) in the Ti-H_2(D_2) solid systems for compositions $0<(H/Ti)<1.85$, at 713K and in the αTiO_y+H_2 solid solutions ($y=(O/Ti)$) at 745K. The combined calorimetric and equilibrium method allows a precise evaluation of the partial molar entropies. The results of this study differ substantially from ealier published data. (38 refs.)

107985 The partial excess thermodynamic properties of hydrogen in palladium. T.Kuji, W.A.Oates (Dept. of Metall., Univ. of Newcastle, Shortland, NSW, Australia), B.S.Bowerman, T.B.Flanagan.
J. Phys. F (GB), vol.13, no.9, p.1785-800 (Sept. 1983).
New measurements of the hydrogen chemical potential and the partial enthalpy of hydrogen in Pd-H alloys are reported. These results are combined with information available in the literature to obtain a consistent set of values for the partial excess enthalpy and entropy of hydrogen as a function of composition. The partial excess entropy of hydrogen varies from negative values at low hydrogen concentrations to positive values at high hydrogen concentrations and it is demonstrated that the principal contribution to this excess entropy is configurational. Problems associated with trying to interpret these properties in terms of pairwise interaction models are discussed. (53 refs.)

107986 Thermodynamic properties of liquid mixtures of krypton+methane. S.F.Barreiros, J.C.G.Calado, M.Nunes da Ponte, W.B.Streett (Centro de Quimica Estrutural, Lisboa, Portugal).
J. Chem. Soc. Faraday Trans. I (GB), vol.79, pt.8, p.1869-80 (Aug. 1983).
The equations of state of liquid methane and of a mixture of composition 0.475 Kr+0.525 CH_4 have been measured at 129.32, 134.32, 142.68 and 147.08K, from just above the saturation vapour pressure to the freezing pressure of krypton. Similar studies have been made at 142.68K for two other

mixtures with mole fraction of krypton $x=0.645$ and 0.339. The results show that the excess volume is small and negative at low pressures and increases slightly with pressure, becoming almost zero at high pressures. The changes in the excess functions G^E, H^E and TS^E with increasing pressure have been calculated. Neither the conformal solution theory (in the van-der-Waals-one-fluid form) nor a perturbed hard-sphere equation could account for the quantitative behaviour of the system. (20 refs.)

107987 Thermodynamics of hard dumbell mixtures. M.Wojcik, K.E.Gubbins (School of Chem. Engng., Cornell Univ., Ithaca, NY, USA).
Mol. Phys. (GB), vol.49, no.6, p.1401-15 (20 Aug. 1983).
Monte Carlo simulation results are reported for a variety of hard homonuclear diatomic fluid mixtures. The total and partial pressures are compared with the predictions of various analytic mixture equations of state, and the excess properties are discussed. The thermodynamic behaviour of the dense fluid mixtures is similar to that of hard convex body mixtures. An accurate mixture equation of state is recommended on the basis of the comparisons. (25 refs.)

107988 Cluster expansion for the thermodynamic potential of simple metals. K.Ebina (Dept. of Material Phys., Osaka Univ., Toyonaka, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.6, p.1686-703 (June 1983).
A cluster expansion scheme is presented for the thermodynamic potential of simple metals based on the thermodynamic formulation of Luttinger and Ward (1960) in terms of the proper self-energy. The obtained expansion proves equivalent to a resummation of the anomalous terms in the simple structural expansion. The contribution from a specific cluster to the ground-state energy is examined numerically, with a particular interest in the role of Lloyd and Sholl's (1968) singularity appearing in the third-order perturbation. (18 refs.)

107989 Investigation of the thermodynamics of oxygen and the determination of phase boundaries in the system copper-oxygen-bismuth at 1200°C. S.Anik, M.G.Frohberg (Inst. fur Metall.-Allgemeine Metall., Tech. Univ. Berlin, Berlin, Germany).
Z. Metallkd. (Germany), vol.74, no.8, p.530-4 (Aug. 1983). In German.
By means of MgO-stabilized ZrO_2 as solid electrolyte the oxygen activities in the system Cu-O-Bi were measured at 1200°C. The results enabled the determination of the phase relations and the position of the conodes. In the homogeneous metal rich melt the oxygen activities were measured. The interaction parameters calculated from the experimental values are ${}^{B}\epsilon_O{}^{Cu}=-6.78$ and ${}^{Cu}\epsilon_O{}^{Bi}=-7.05$. The small difference of these values is discussed. 65.70 THERMAL EXPANSION AND THERMOMECHANICAL EFFECTS

(see also 64.30 Equations of state; for electronic thermal conduction, see 72.15 and 72.20; for thermal conductivity of superconductors, see 74.30E; for pyroelectric and electrocaloric effects, see 77.70)

107990 The oxide β-Ga_2O_3: force field, thermal expansion, and rigidity anisotropy. D.Dohy, J.R.Gavarri (Lab. de Chimie-Phys., Univ. Paris XIII, Villetaneuse, France).
J. Solid State Chem. (USA), vol.49, no.1, p.107-17 (Aug. 1983). In French.
The thermal expansion tensor of the gallium oxide β-Ga_2O_3 was determined from low temperature X-ray diffraction. At $T=250$K the principal directions of the tensor ($\alpha_3\simeq\alpha_a=2\times10^{-6}$ K^{-1}, $\alpha_2=\alpha_b=5.9\times10^{-}6$ K^{-1}, $\alpha_1\simeq\alpha_c=5\times10^{-6}K^{-1}$) are close to the mean directions associated with the various chemical bonds of the monoclinic structure. The components α_a, α_b, and α_c are directly linked to the thermal bond expansions. These can be estimated from values of stretching force constants available in a previous vibrational study. The structure may be described in terms of an infinite set of rigid blocks weakly bound to each other along the **c** direction. The Debye temperature ($\Theta_D\simeq730$K) can be calculated using the Debye model. This value leads to an estimate of the mean force constant (1.75 mdyne/Å) close to that obtained by spectroscopic data. Through these numerical values, one can evaluate the compressibility (0.5×10^{-11} Pa^{-1}) and the Gruneisen constant (~0.96). These parameters, characteristic of the compound and of its crystal structure, were obtained from structural data. In addition, previous mechanical and morphological properties are also interpreted and correlated with disorder effects. (14 refs.)

107991 Thermal expansion of amorphous $Pd_{0.775}Si_{0.165}Cu_{0.06}$. W.M.MacDonald, E.J.Cotts, A.C.Anderson (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).
Phys. Rev. Lett. (USA), vol.51, no.10, p.939 (5 Sept. 1983).
The thermal expansion of glassy PdSiCu has been reported to be negative at temperatures below 2.5K and to be associated with a large negative Gruneisen parameter. This anomaly was attributed to the two-level states (TLS) found in glassy metals and other amorphous solids. In a study of the low-temperature thermal expansions α of a series of amorphous solids and disordered crystals, the authors have failed to observe a negative expansion for glassy PdSiCu. (7 refs.)

107992 Thermal expansion of thin gold films. A.T.Pugachev, N.P.Churakova.
Russ. Metall. (GB), no.3, p.104-6 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.121-2 (1982).
The linear expansion coefficient of the gold films 50-100 Å thick is 15-20% higher than the value of a for thick gold. The increase of a is caused by a dimensional effect resulting from the influence of the surface and near-surface layers on the thermal expansion of the thin films. (8 refs.)

107993 Mismatch in the thermal expansion coefficients in $Ga_{1-x}Al_xP$-GaP heterostructures. V.N.Bessolov, S.G.Konnikov, V.E.Umanskii, Yu.P.Yakovlev (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.257-8 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.411-12 (Feb. 1983). [received: Sept. 1983]
The authors determined the thermal expansion coefficients of GaP, $Ga_{1-x}Al_xP$, and AlP. They grew layers of $Ga_{1-x}Al_xP$ solid solutions of thickness ~2 μm on a GaP substrate [(100) face] by liquid-phase epitaxy at temperatures $T_g=950$-1100°C. They studied the samples over a wide range of temperatures using a widely diverging beam in a scanning electron microscope. By using an attachment permitting X-ray diffraction analysis over a broad range of temperatures they were able to carry out measurements in the 25-650°C range; the temperature was recorded and held constant to better than ±2°C. The value of x in the $Ga_{1-x}Al_xP$ layers was determined by microscopic X-ray analysis. (9 refs.)

66.00 TRANSPORT PROPERTIES OF CONDENSED MATTER (NONELECTRONIC)

66.10 DIFFUSION AND IONIC CONDUCTION IN LIQUIDS

107995 Thermal Soret diffusion in the liquid phase epitaxial growth of binary III-V compounds. Chung-Ping Chien, B.L.Mattes (Electron Phys. Lab., Univ. of Michigan, Ann Arbor, MI, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.648-55 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Steady-state liquid phase epitaxial nucleation and growth conditions have been achieved in the growth of III-V compounds that yield terrace and miniscus line-free layers and uniform submicron thickness control. A theoretical analysis of transient thermodynamic transport through super- and undersaturated melts appears to show that the thermal Soret effect is a very strong coupling force between solute and heat transport. When nucleation and growth are initiated at near steady-state equilibrium liquidus conditions, at the substrate interface with a temperature gradient, melt-back and spontaneous nucleation are minimized. This appears to indicate that near the interface localized nonuniformities exist in supersaturated melts that yield unstable conditions for nucleation and growth. The Soret thermal diffusion coefficient has been evaluated in terms of the solute and solvent masses and the temperature dependence of the diffusion coefficient. At a noninteracting interface the steady-state solute concentration is always greater than the equilibrium liquidus concentration with a positive temperature gradient to the III-V source. The increased concentration is a result due to zero net solute flux at this interface where equal but opposite driving forces are developed as steady-state conditions are approached. At a very critical time during melt saturation the equilibrium liquidus concentration is reached when the substrate should be brought into contact with the melt to avoid melt-back and spontaneous nucleation. The critical time determined in this analysis appears to be in agreement with the experimental results. (16 refs.)

107996 A reduction rule in heats of transfer for aqueous 1-1 electrolytes. N.Takeyama, K.Nakashima (Dept. of Industrial Chem., Saga Univ., Saga, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2692-8 (Aug. 1983).
Common to aqueous 1-1 electrolytes MX, after the empirical estimation of a constant thermal diffusion coefficient $D_0'=20.2\times10^{-8}$ cm^2 s^{-1}K^{-1} at 298.2K, ascribable to water, a reduction rule has been found between the heat of transfer Q^*(MX) and the reduced one q^*(MX), as shown by $Q^*(\mathrm{MX})=q^*(\mathrm{MX})-2RT^2D_0'/D^0(\mathrm{MX})$, where R is the gas constant, T is kept at 298.2K, and D^0(MX) is the limiting diffusion coefficient. In the relative error 0.1%, discarding $Q^*(\mathrm{LiCl})D^0(\mathrm{LiCl})/2RT^2D_0'$ in comparison with unity, one may take a reference $q^*(\mathrm{LiCl})=2RT^2D_0'/D^0(\mathrm{LiCl})$ to the reduced ionic heats of transfer q^*(ion). Using the additivity in Q^*(MX) and q^*(MX), together with the Nernst relation for D^0(MX), the authors propose rational ionic heats of transfer Q_r^*(MX) for 17 aqueous univalent ions, which agree fairly with the conventional values by Snowdon and Turner.

107997 Thermodynamics of thermal diffusion in aqueous ionic solutions. N.Takeyama, K.Nakashima (Dept. of Industrial Chem., Saga Univ., Saga, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2699-705 (Aug. 1983).
Transforming fluxes of aqueous ions and of water in an apparatus system into those relative to water within the linear theory of nonequilibrium thermodynamics, the authors have expressed the thermal diffusion coefficient as a difference between those of water and of the electrolyte, together with the diffusion coefficient in an invariant form under the transformation in ideal dilute conditions. Thereby the heat of transfer may be formulated in an exact agreement with the reduction rule proposed by the present authors, by which individual ionic thermal diffusion coefficients are evaluated for 17 aqueous univalent ions. (7 refs.)

107998 Measurements of self-diffusion coefficients of the nitrate ion in aqueous solutions of potassium nitrate and calcium nitrate. T.Hashitani (Faculty of General Education, Tokyo Univ. of Agriculture & Technol., Tokyo, Japan), K.Tanaka.
J. Chem. Soc. Faraday Trans. I (GB), vol.79, pt.8, p.1765-8 (Aug. 1983).
Self-diffusion coefficients of nitrate ions in aqueous solutions of potassium and calcium nitrate have been measured at 298.2K over the concentration range 0.001-0.5 mol. dm^{-3} using a diaphragm cell with ^{15}NO$_3^-$ as tracer. Activation energies for the self-diffusion of nitrate ions in 0.01 and 0.1 mol. dm^{-3} potassium nitrate and calcium nitrate solutions have also been determined from measurements at temperatures from 278 to 308K. These are compared with those for ammonium ions. (6 refs.)

107999 Diffusional behaviour of entangled star polymers. J.Klein, D.Fletcher (Cavendish Lab., Univ. of Cambridge, Cambridge, England), L.J.Fetters.
Nature (GB), vol.304, no.5926, p.526-7 (11 Aug. 1983).
Reports a critical study of the diffusion coefficient D of a series of model linear and three-arm star-branched polymers, diffusing in an entangled linear polymer melt matrix, designed to elucidate dynamic mechanisms for the entangled stars. Measuring D as a function of diffusant degree of polymerization N the authors find, for the linear molecules, $D\propto N^{-2}$, as expected for purely reptative motion. For the case of moderately short stars, however, D falls considerably faster than an inverse square power law, and is well fitted by an exponential type relation $D\propto \mathrm{e}^{-\alpha N}$. There is evidence that for the longest stars used in the present study it is the release of entanglements by reptation of the linear matrix molecules which dominates the dynamics. This is the first direct indication of such 'tube-renewal' effects in a system of entangled polymers. (12 refs.)

108000 Conductometric investigation of the KCl-MnCl$_2$ system. R.A.Uzbekov, B.P.Burylev, Z.V.Kakhovskaya (Kuban State Univ., Krasnodar, USSR).
Sov. Electrochem. (USA), vol.18, no.12, p.1427-30 (Dec. 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.12, p.1598-601 (Dec. 1982).
A method for studying the phase diagrams of binary salt systems on the basis of the temperature dependence of their electrical conductivity has been proposed. (13 refs.)

108001 Influence of surface tension of the solvent on duration of induction period of diffusion in methanol-polymethyl methacrylate system. S.O.Granik, E.F.Samarin, B.P.Shtarkman.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.8, p.1621-4 (Aug. 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
The new concept of the nature of induction period of diffusion often observed in various polymer-solvent systems is stated. For the PMMA-methanol system the unique relation of duration of induction period with the value of surface tension of methanol is shown. The model of the mechanism of diffusion of the solvent into the polymer is proposed for the initial stage of diffusional process. (9 refs.)

108002 Features of self-diffusion of the solvent in the polymer-low-molecular compound system. A.I.Maklakov.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.8, p.1625-30 (Aug. 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
In polymer-low-molecular compound systems at $T>T_g+(80\text{-}100^\circ)$ (T_g is the glass transition temperature of the system) with assumption about the independent behaviour of holes being necessary for diffusion, the temperature dependences of coefficient of self-diffusion of the solvent D are shown to be described by equation of Arrhenius type with the constant activation energy E_D. This fact is observed experimentally. The decrease of D with increasing of the polymer content in the system is a result of kinematic limitations for the motion of small molecules. Increase of E_D with decreasing of the solvent content is mainly related to enhancing of the energy of the formation of the hole. (11 refs.)

108003 Thermodynamics of irreversible processes in molten salts: problems of interdiffusion measurements under microgravity. J.Richter, A.Hahne (Inst. fur Phys. Chem, RWTH Aachen, Aachen, Germany).
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.153-60
One attempt for the description of the structure of molten salts are the friction coefficients, which combine thermodynamic with transport data. One of these transport data is the diffusion coefficient which must be measured in differential steps as a function of the composition of the melt. The most suitable method for these measurements is the optical one. Reliable values are only obtained, if the diffusion is the only transport process, which is not superposed by any other transport phenomena as convection in melts at high temperature. Results are given for the molten KNO$_3$-AgNO$_3$ mixture at 300°C and the experimental set up and the filling procedure under microgravity are presented. (12 refs.)

108004 Measurements of diffusion coefficient of copper in liquid lead in microgravity by the grain boundary grooving technique. O.Minster, C.Vahlas, C.Senillou, L.Coudurier, N.Eustathopoulos, P.Desre (Lab. Thermodynamique et Phys.-Chimie Metallurgiques, ENSEEG, Saint-Martin d'Heres, France).
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.301-6
Presents results concerning the diffusion coefficient, D, of copper in liquid lead, obtained in microgravity and on Earth by the grain boundary grooving (GBG) technique. Linear dimensions (depth and width) of the grooves, formed in the grain boundaries of bicrystals of Cu in equilibrium with Pb-Cu alloys, have been measured after an annealing time of 8 h, at four temperatures between 900 and 1200 K. Comparison of groove dimensions obtained on Earth and in microgravity, indicates that the apparent diffusion coefficient on Earth is higher (by about 40%) than that obtained in microgravity. This difference is attributed to microconvection produced in the vicinity of the solid-liquid interface by solute concentration gradients parallel to the interface. (22 refs.)

66.20 DIFFUSIVE MOMENTUM TRANSPORT

(inc. viscosity of liquids)

108005 Polymer conformation and viscometric behaviour. I. Conformational transition in poly(benzyl methacrylate) in dilute solutions. L.Gargallo, M.I.Munoz, D.Radic (Lab. de Fisico Quimica Molecular, Pontificia Univ. Catolica de Chile, Santiago, Chile).
Polym. Bull. (Germany), vol.10, no.5-6, p.264-70 (Aug. 1983).
The viscometric and refractometric behaviour of poly(benzylmethacrylate) (PBM) in isobutyl methylketone (IMK) was studied as a function of the temperature. The viscometric relations in IMK and toluene were established by membrane osmometry and GPC at 25°C. The viscometric results show discontinuities in the intrinsic viscosity [η] in IMK and sharp changes in the conformational and thermodynamic parameters K$_\theta$ and B. The variation on the unperturbed dimensions of the polymer chain was attributed to a conformational transition. The influence of the side groups was analyzed. The conformational behaviour of this polymer was compared with the saturated corresponding poly (cyclohexylmethyl methacrylate). (14 refs.)

108006 Properties of the concentrated xanthan gum solutions. M.Milas, M.Rinaudo (Univ. Sci. et Medicale de Grenoble, Martin d'Heres, France).
Polym. Bull. (Germany), vol.10, no.5-6, p.271-3 (Aug. 1983).
Viscosity measurements have been carried out on concentrated aqueous solutions of the polyelectrolytic polysaccharide xanthan in the range where the solutions of xanthan exhibit a transition between isotropic and cholesteric phases. The critical volume fractions of the polymer corresponding to both transitions (isotropic-biphasic; biphasic-cholesteric) are discussed in term of the Flory theory for rigid rod like molecules. (10 refs.)

108007 Viscosity of some strong electrolytes in DMF-H_2O binary solvents at 35°C. N.C.Dey, B.K.Saikia (Regional Res. Lab., Jorhat, India), I.Haque.
Trans. SAEST (India), vol.18, no.1, p.49-57 (Jan.-March 1983).
The viscosities of dilute solutions of KCl, KBr, KI, Me_4NBr, Et_4NBr and Pr_4NBr in different binary solvents of DMF-H_2O were analysed by the Jones-Dole empirical equation. The viscosity coefficients were split into ionic components and the ion-solvent interactions and discussed in terms of flow volumes. (13 refs.)

66.30 DIFFUSION IN SOLIDS

108008 Size effect, internal stress and diffusion driven boundary motion. P.G.Shewmon (Dept. of Metall. Engng., Ohio State Univ., Columbus, OH, USA), Zong-Sen Yu.
Metall. Trans. A (USA), vol.14A, no.8, p.1579-82 (Aug. 1983).
Diffusion driven boundary motion (DDBM) was studied in the iron-zinc system using thicker iron sheets (127 μm) than in previous work, to check the effect of restraint on the thin DDBM produced surface layer. The sheets were exposed to zinc vapor at 600°C for varying times. The DDBM layer formed through the nucleation of many small grains on the surface which then grew down to a depth of roughly 20 μm and spread to cover the surface in four hours. Samples of iron several millimeters thick developed no such DDBM layer after exposure to the same atmosphere for eight days. It is suggested that the volume change accompanying DDBM is accommodated by plastic strain of the core of the 127 μm iron, but the thicker sample constraints such nucleation and growth. The solid solution layer thickens with time at roughly constant rate, while its zinc content rises toward that of the equilibrium surface layer. This strongly suggested repeated sweeping of the layer by DDBM driven motion of boundaries in the layer. (13 refs.)

66.30D Theory of diffusion and ionic conduction in solids

108009 Possible diffusion mechanism in group IV transition metals. G.V.Samsonov, L.F.Pryadko, E.G.Borisenko.
Bull. Acad. Serbe Sci. & Arts Cl. Sci. Tech. (Yugoslavia), no.20, p.55-61 (1982). In Russian.
The anomalous diffusion process in group IV d-metals is described on the basis of a new atomic mechanism: in the activated state, a geometric atom configuration is formed as well as chemical bonding corresponding to the ω-phase. Taking into account existing data on the relative stability of the ω-state in these metals, it is possible to describe the whole complex anomalous behaviour of the investigated elements in diffusion processes: the deviation of the diffusion coefficient temperature dependence from the Arrhenius plot, the negative value of the diffusion activation entropy, superfast diffusion of d-element impurities with $n_{(s+d)}>4$, and low activation volume. (12 refs.) *V.G.P.*

108010 Diffusion in an inhomogeneously deformed medium. A.F.Zhuravlev (Inst. of Phys. of Metals, Acad. of Sci., Kiev, Ukrainian SSR).
Phys. Met. (GB). Translation of: Metallofizika, Kiev (USSR), vol.4, no.3, p.592-6 (1982). [received: Aug. 1983]
In the case of inhomogeneous deformations of the medium, the expressions for the coordinate derivatives also change. The author develops a consistent derivation of the diffusion equation for a medium subjected to plastic deformations. (3 refs.)

108011 Diffusion in concentrated lattice gases. IV. Diffusion coefficient of tracer particle with different jump rate. R.Kutner, K.W.Kehr (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany).
Philos. Mag. A (GB), vol.48, no.2, p.199-213 (Aug. 1983).
For pt.III see Phys. Rev. B, vol.26, p.2967 (1983). The authors have investigated tracer diffusion in a three-dimensional lattice gas of arbitrary concentration by Monte-Carlo simulation. The tracer particle has a jump rate which differs from that of the other particles. Results are presented for the tracer correlation factor for various concentrations and ratios of the jump rates. At high particle concentration, Manning's theory for impurity diffusion is applicable. The critical behaviour near the percolation threshold of the vacancies is compared with the scaling laws given by Gefen, Aharony and Alexander (1983) and their generalization to a finite jump rate of the other particles. A recent theory proposed by Nakazato and Kitahara (1980) provides a good description of the data at small particle concentration. (27 refs.)

108012 Diffusion-induced changes in the defect structure of solids (review). B.Ya.Lyubov.
Russ. Metall. (GB), no.1, p.56-67 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.1, p.64-79 (1982).
A number of problems are considered in the diffusion theory of vacancies and impurity atoms in structurally non-uniform solids, associated with changes in their defect structure (non-conservative movement of dislocations, formation and development of discontinuities in alloys, etc.). The described mathematical diffusion theory problems are non-trivial. The presence of stress fields, sources and sinks for diffusing particles and, in particular, moving boundaries in this area, complicate the computing methods used and each particular case requires special choice and improvement in the method. (46 refs.)

108013 An invariant formulation of multicomponent diffusion in crystals. J.W.Cahn (Center for Materials Sci., NBS, Washington, DC, USA), F.C.Larche.
Scr. Metall. (USA), vol.17, no.7, p.927-32 (July 1983).
Presents a formulation which grew out of a thermodynamic study. It incorporates some important thermodynamic properties that result from constraints that crystallinity imposes. Consistent with this crystallinity it uses the lattice as a coordinate system. The resulting formulation showed some unexpected invariances to what appeared to be an awkward conventional choice. (16 refs.)

108014 A kinetic model for self-interstitial trapping at solutes. C.Abromeit, H.Wollenberger (Hahn-Meitner-Inst. fur Kernforschung Berlin GmbH, Berlin, Germany).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.349-52
From damage rate measurements at different irradiation temperatures in the stage II range the product of the solute trapping radius multiplied by the trap concentration depends on temperature as T^{-2} which cannot be understood by stationary drift diffusion in a solute interstitial interaction potential. Furthermore, details of the interstitial agglomeration at solutes as derived from the defect build-up and recovery by means of resistivity, hyperfine interaction and mechanical relaxation measurements support the suggestion of nonstationary conditions at the trapping sites. A model is presented for time dependent discrete lattice diffusion of the self-interstitials near the solute. By numerical fits to experimental data the jump behaviour of Cu self-interstitials near solutes is determined. (11 refs.)

108015 Tracer diffusion in nonstoichiometric crystals. K.W.Kehr (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany), R.Kutner, K.Binder.
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.582-5
The dynamical process of diffusion of tagged particles in nonstoichiometric crystals has been studied in a lattice-gas model. The mean-square displacement and the waiting-time distributions of a tagged particle have been obtained by numerical simulations. The frequency-dependent tracer diffusion coefficient has been derived in the approximation of correlated consecutive jumps. The calculations have been extended to the case of a different jump rate of the tagged particle. (9 refs.)

108016 Site blocking effect in diffusion on a lattice. K.Kitahara (Faculty of Liberal Arts, Shizuoka Univ., Shizuoka, Japan), K.Nakazato.
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.586-8
Diffusion constants of a system of particles of several types are calculated as functions of concentrations by using a model in which more than one particle cannot occupy the same lattice site at the same time and by performing a systematic expansion in the power of $c_0(1-c_0)$, where c_0 is the concentration of vacancies. (5 refs.)

66.30F Self-diffusion in metals, semimetals, and alloys

108017 Kirkendall effect in Cu-Sn alloys. A.G.Guy (Dept. of Phys. & Space Sci., Florida Inst. of Technol., Melbourne, FL, USA).
Scr. Metall. (USA), vol.17, no.7, p.967-8 (July 1983).
The author comments on the work of K. Hoshino, Y. Iijima and K. Hirano (see Trans. JIM, vol.21, p.674, 1980). The results of Hoshino et al. merit comment because they purport to demonstrate the absence of the well-documented anomaly in the Kirkendall effect in Cu-Sn alloys. The anomaly was first reported in a classic study by da Silva and Mehl (1951) and was confirmed by Oikawa and Hosoi (1975) using more accurate experimental techniques. Hoshino et al. explain the disagreement by stating that the two previous investigations, '...have not taken into account the difference in the partial molar volumes between copper and tin in Cu-Sn alloys.' This statement is incorrect, for in fact both da Silva and Mehl, and Oikawa and Hosoi employed a suitable correction for difference in atomic size. (7 refs.)

108018 Reply to 'Kirkendall effect in Cu-Sn alloys' by Prof. A.G. Guy. K.Hoshino, Y.Iijima, K.Hirano (Dept. of Materials Sci., Faculty of Engng., Tohoku Univ., Sendai, Japan).
Scr. Metall. (USA), vol.17, no.7, p.969-70 (July 1983).
The authors reply to the comments made by A.G. Guy (see ibid., vol.17, no.7, p.967, 1983). Hoshino et al. contend that an equation derived by Guy is incorrect and that no anomaly is exhibited by the Kirkendall effect in Cu-Sn alloys. (8 refs.)

108019 Migration energies of a vacancy and a divacancy in aluminum. O.Takai, M.Doyama, Y.Hisamatsu (Dept. of Metall. & Materials Sci., Univ. of Tokyo, Tokyo, Japan).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.117-19
The migration energies of a vacancy and a divacancy in aluminum have been calculated in terms of the pseudopotential theory considering the lattice relaxation around a migrating atom. Only the structural energies were considered under the condition of constant volume. The migration energy can be obtained by comparing the total energy of an activated configuration with that of a normal configuration. The authors did not consider the lattice relaxation around a vacancy or a divacancy, but considered the lattice relaxation when the migrating atom reached at the saddle point. The calculated migration energy of a vacancy was 0.51 eV and that of a divacancy was 0.26 eV. (9 refs.)

108020 A method for investigating migration of point defects. B.Nielsen, K.Petersen (Lab. of Appl. Phys. II, Tech. Univ. of Denmark, Lyngby, Denmark).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.195-8
By use of the signal from positrons annihilating in voids it is possible to develop a method distinguishing whether mono-vacancies or interstitals are migrating at a certain temperature. This method, the void response method, was used to investigate molybdenum and it was found that mono-vacancies are migrating in Stage III. (6 refs.)

108021 Interstitialcy transport in dilute alloys under irradiation. H.Wollenberger (Hahn-Meitner-Inst. fur Kernforschung Berlin GmbH, Berlin, Germany).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.339-45
The configuration of self-interstitials has been shown to be of the dumbbell type wherever a firm determination of the structure was possible. Migration of such a defect should cause self-diffusion. Yet this effect needs to be demonstrated experimentally. Impurity diffusion via interstitialcy migration requires formation of the mixed dumbbell and mobility of this defect. The author reviews quantitative experimental information on the impurity diffusion of the solutes Be and Ni in Cu. (35 refs.)

108022 The mobility of vacancies and interstitials in Ag-Cu studied by high-voltage electron microscopy. H.Takahashi (Metals Res. Inst., Hokkaido Univ., Sapporo, Japan), K.Urban.
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.346-8
A study has been carried out by high-voltage electron microscopy on the relative mobility of vacancies and interstitials in an Ag-0.17 at.% Cu alloy at temperatures between 345K and 775K. It is found that in the whole temperature range the mobility of vacancies is higher than that of interstitials. This can be explained by the formation of interstitial-solute complexes retarding interstitial motion. During prolonged irradiation, solute segregation occurs to sinks with the result that the interstitial mobility increases to the extent that it eventually surpasses that of the vacancies. (7 refs.)

66.30H Self-diffusion and ionic conduction in nonmetals

108023 Electrical and thermal properties of Na_2SO_4 doped with $NaVO_3$, $Ln_2(SO_4)_3$ (Ln=Eu,Pr). N.Imanaka, G.Adachi, J.Shiokawa (Dept. of Appl. Chem., Osaka Univ., Osaka, Japan).
Can. J. Chem. (Canada), vol.61, no.7, p.1557-61 (July 1983).
In order to develop useful solid electrolytes for SO_2 detectors, Na_2SO_4, Na_2SO_4-$Eu_2(SO_4)_3$, Na_2SO_4-$NaVO_3$ and Na_2SO_4-$NaVO_3$-$Ln_2(SO_4)_3$ (Ln=Eu,Pr) systems have been prepared and their electrical and thermal properties have been measured. By doping Na_2SO_4 with $Eu_2(SO_4)_3$, the electrical conductivity increases and the apparent activation energy of the Na_2SO_4-$Eu_2(SO_4)_3$ system shows a value between those of Na_2SO_4-III and Na_2SO_4-I. Addition of $NaVO_3$ and $Ln_2(SO_4)_3$ (Ln=Eu,Pr) to Na_2SO_4 suppressed the phase transformation, by stabilizing the structure of the Na_2SO_4-I phase even at a relatively low temperature. (32 refs.)

108024 Anomalous temperature dependence of the self-diffusion coefficient in silicon. V.M.Vorob'ev, V.A.Murav'ev, V.A.Panteleev (Physicotech. Res. Inst., N.I. Lobachevskii State Univ., Gor'kii, USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1515-18 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1765-8 (Nov. 1982).
The authors have proposed a new vacancy mechanism of self-diffusion in silicon, based on the possibility of elementary vacancy hops into both the first and the second coordination spheres. The model provides an explanation of the experimentally observed anomaly in the self-diffusion coefficient D(T). An analytical expression has been obtained for D(T), taking into account correlation effects. The migration energy for vacancies has been estimated for the new type of hop to be $\epsilon_2 \approx 1.1$ eV, which agrees well with the reorientation energies of defects of the E-center type in Si. (18 refs.)

108025 Tellurium self-diffusion and point defects in lead telluride. Yu.N.Simirskii, L.P.Firsova (M.V. Lomonosov State Univ., Moscow, USSR).
Inorg. Mater. (USA), vol.18, no.9, p.1291-4 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1510-13 (Sept. 1982). [received: Sept. 1983]
Radioactive tracers have been used to determine the tellurium self-diffusion coefficient in lead tellurides with various deviations from stoichiometry on the tellurium-rich side. It is found that the self-diffusion coefficient of tellurium at 973K is only weakly dependent on the vapor pressure of the tellurium in equilibrium with the solid. (12 refs.)

108026 Defects and diffusion in MnO. P.Kofstad (Dept. of Chem., Univ. of Oslo, Oslo, Norway).
J. Phys. & Chem. Solids (GB), vol.44, no.9, p.879-89 (1983).
Diffusional transport of manganese through MnO scales has been studied at temperatures from 900-1200°C by means of a novel diffusion/evaporation method and by the two-stage oxidation (Rosenburg) method. In the phase field of $Mn_{1-v}O$ near the MnO_3O_4 phase boundary the manganese self-diffusion coefficient and the concentration of defects is concluded to be proportional to $p_A{}^{1/2}$, where A is O_2. The concentration of defects increases with decreasing temperature at constant partial pressure of oxygen. In this nonstoichiometry range $Mn_{1-y}O$ has properties similar to wustite, $Fe_{1-y}O$ and it is concluded that the important cation defects are defect clusters. The results may be explained assuming that the defect clusters consist of four vacancies on octahedral sites and one interstitial on a tetrahedral site. Values for the concentration of defects, the self-diffusion of manganese ions and of the defects have been calculated. For the phase field near the Mn/MnO phase boundary it is concluded that Mn-interstitials predominate. (22 refs.)

108027 Gravity-induced EMF in superionic conductor $RbAg_4I_5$. M.E.Kompan (A.F. Ioffe Physicotech. Inst., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.6, p.327-30 (20 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.6, p.275-8 (20 March 1983). [received: Sept. 1983]
The electric field arising due to redistribution of mobile Ag^+ cations under the action of gravity is observed experimentally in the superionic conductor $RbAg_4I_5$. It is shown that under the experimental conditions the action of gravity on mobile cations is equivalent to the action of an EMF. (4 refs.)

108028 Magnetic resonance study of diffusive phenomena in the phases of the NaF-BiF_3 system. J.Senegas, C.Chartier, J.Grannec (Lab. de Chimie du Solide, Univ. de Bordeaux I, Talence, France).
J. Solid State Chem. (USA), vol.49, no.1, p.99-106 (Aug. 1983). In French.
^{19}F and ^{23}Na wide-line NMR studies are reported on $NaBiF_4$ and the solid solution $Na_{1-x}Bi_xF_{1+2x}$ for $x=0.62$ and $x=0.68$ in the $-100°$ to $+200°C$ temperature range. No sodium mobility could be detected in $NaBiF_4$, but the mobility is significant in the solid solution. The fluorine motions are weakly activated (0.28 eV) in $NaBiF_4$ and result only from short-range motion (correlated motions or reorientations). In the solid solution the concentration of mobile fluoride ions increases with temperature. Compared to the values given by complex impedance measurements, the activation energies in this thermal range (0.18 eV for $x=0.62$ and 0.20 eV for $x=0.68$) may be correlated with phenomena preceding the long range conductivity which appears at higher temperature. (9 refs.)

108029 A classical hopping conduction and oscillation: AC conductivity. T.Ishii (School of Engng., Okayama Univ., Okayama, Japan).
Solid State Commun. (USA), vol.47, no.9, p.717-20 (Sept. 1983).
Frequency-dependent conductivity for hopping and oscillation of particles is discussed in the context of the master equation where attention is only paid to a thermal activation type of hopping. On adopting the Einstein oscillators, which is of particular interest in superionic conductors, the author gives an exact expression of the conductivity which involves the above twofold motions of particle, hopping and oscillation. The crossover between the is surely found by performing numerical calculations for physical parameters corresponding to those of Na-β-Al_2O_3. (6 refs.)

108030 Effect of copper on the electrical conductivity of the solid electrolyte $RbAg_4I_5$. V.N.Zagorodnev, N.V.Lichkova, E.B.Yakimov (Inst. of Solid-State Phys., Acad. of Sci., Moscow, USSR).
Sov. Electrochem. (USA), vol.18, no.12, p.1472-5 (Dec. 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.12, p.1650-3 (Dec. 1982).
Solid electrolytes, i.e. crystals with high ionic conductivity, are presently attracting the attention of researchers because of their promising wide, practical application. Perhaps the greatest degree of attention is being directed towards $RbAg_4I_5$ which possesses high ionic conductivity at room temperature. This is because the number of cationic sites in the crystal lattice far exceeds the number of silver ions so that the sites form zigzag channels that penetrate the entire crystal. It was therefore considered of interest to discover how the electrical properties of $RbAg_4I_5$ are affected by various crystal-lattice defects that can disrupt the channel structures. One such defect is a low-mobility impurity that can displace silver and thereby block the channel. The effect of impurities on the electrical conductivity of $RbAg_4I_5$ has been studied but the results are in poor agreement. This may be due basically to variations of factors, such as grain boundaries, in the real structure since the work was carried out on polycrystalline samples and on sprayed films. A study of the grain boundary effect is also of interest as conductivity along the boundaries plays an important part in generating the electrical properties of polycrystals with ionic conductivity. (10 refs.)

108031 Investigation of the electric double layer on platinum and gold electrodes in a solid electrolyte Ag_4RbI_5. I.D.Remez (Inst. of Electrochem., Acad. of Sci., Sverdlovsk, USSR).
Sov. Electrochem. (USA), vol.18, no.12, p.1481-4 (Dec. 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.12, p.1660-3 (Dec. 1982).
The solid electrolyte Ag_4RbI_5 was prepared in a high degree of purity. Within the range of pressing pressures on the samples $(43\text{-}49)\times10^7$ Pa, the values of the double-layer capacitance and the conductivity of the electrolyte remained practically constant. When the pressure was lowered, a substantial decrease in the value of the double-layer capacitance and conductivity was observed, while at increased pressures the appearance of cracks was observed (overpressing). Since Ag_4RbI_5 has very high conductivity at room temperature, during pressing shortening of the electrodes must be excluded. This was achieved by the use of Teflon linings. The specific double-layer capacitance was determined on the geometrical surface of the investigated electrodes. (14 refs.)

108032 Electrical conductivity of glasses of the system SiO_2-PbO-BaO-K_2O-Na_2O. L.Sasek, Nguyen Van Tu (Dept. of the Technol. of Silicates, Inst. of Chem. Technol., Prague, Czechoslovakia).
Silikaty (Czechoslovakia), vol.27, no.3, p.199-213 (1983). In Czech.
Deals with the effect of chemical composition on specific electrical conductivity of lead glasses. The planned factor experiment method was used for determining regressive equations allowing the authors to calculate the temperature dependence of specific electrical conductivity from the chemical composition of glass. The regressive coefficients further served for the establishment of factors which express quantitatively the change in specific electrical conductivity due to substitution of 1 wt.% of silica by another oxide. The respective change in specific electrical conductivity is expressed in terms of change in temperature required for maintaining the original value of specific electrical conductivity exhibited by the glass before the substitution of oxides. The calculated factor values express very comprehensively the effects of the individual oxides on replacement of 1 wt.% of SiO_2 for the given oxide, and permit them to determine very rapidly the respective change in electrical conductivity for a given substitution of oxides. The greatest effect in this respect is exhibited by soda, the smallest by baria. The influence of the individual oxides on the specific electrical conductivity is identical with the effects of the given oxides on the viscosity of lead glasses. (23 refs.)

108033 Ionic conductivity of fluorite-type fluorides. P.Hagenmuller, J.-M.Reau, C.Lucat, G.Villeneuve (Univ. de Bordeaux I, Talence, France).
Silikaty (Czechoslovakia), vol.27, no.3, p.225-31 (1983). In Czech.
The monovalent cation-fluorine bond in $MBiF_4$(M-K,Rb,Tl) increases the mobility, but in derived solid solutions $M_{1-x}Bi_xF_{2x+1}$ it is again suppressed due to a higher Bi^{3+} content. The authors succeeded to improve the conductivity of β-PbF_2 by partial replacing of Pb^{2+} by Bi^{3+} cations in $Pb_{1-x}Bi_xF_{2+x}$ series, where anionic disordering exists. Similar results were obtained for the $Pb_{1-x}ThF_{2+2x}$ solid solutions and particularly for $PbSnF_4$ which is the best anionic conductor so far known. The reason in all cases is the high polarizability of Bi^{3+}, Th^{4+} and Sn^{2+} cations, respectively. Conducting fluorides seem to be suitable materials for secondary microbatteries; an example if the $Bi/Pb|PbF_2|BiF_3/Bi$ chain. Another application is the determination of gas pressure by such galvanic chains working at room temperature. (11 refs.)

108034 Disorder phenomena in β-alumina. U.Strom (Naval Res. Lab., Washington, DC, USA).
Solid State Ionics (Netherlands), vol.8, no.4, p.255-79 (July 1983).
Experimental and theoretical results are reviewed relevant to the conduction plane disorder in the nonstoichiometric fast ion conductor Naβ-alumina. Thermal, dielectric, acoustic, nuclear magnetic resonance and electron spin resonance measurements at low temperatures (<50K) can be interpreted in terms of the tunneling mode formalism previously proposed for glasses. Experimental results at higher temperatures exhibit behavior similar to glasses near their glass transition. (89 refs.)

108035 The relationship between measured activation enthalpy and pre-exponential factor: rate processes in ionic crystals in the intrinsic-extrinsic region. T.Dosdale, R.J.Brook (Dept. of Ceramics, Univ. of Leeds, Leeds, England).
Solid State Ionics (Netherlands), vol.8, no.4, p.297-304 (July 1983).
In measurements of activated processes, such as diffusion, ionic conduction, creep and sintering, it is common to use Arrhenius plots of the measured quantity, $A(T)$, to give the logarithm of the pre-exponential factor, log A_0, and the experimental activation enthalpy, h. It is shown that, in the cases of conduction and diffusion in ionic crystals, well-defined relationships can exist between the values of log A_0, log A and h, measured on similar samples with differing doping or impurity levels. These relationships are derived for ionic crystals showing either Frenkel, Schottky, or interstitial disorder. In the resulting plots of log A_0 versus h, approximately linear regions are shown to exist, similar to those described by the compensation law for glasses and by the Meyer-Neldel rule for semiconductors. (11 refs.)

108036 Ion transport and structure in silver borate glasses. G.Chiodelli, G.Campari Vigano, G.Flor, A.Magistris (Dipartimento di Chimica Fisica, Univ. di Pavia, Pavia, Italy), M.Villa.
Solid State Ionics (Netherlands), vol.8, no.4, p.311-18 (July 1983).
A study of ionic conductivity in silver borate glasses is presented, which includes (i) a full characterization of the ion transport properties in the $AgI:Ag_2O:B_2O_3$ glasses, (ii) results for glasses where iodine is totally or partially substituted by another halide, (iii) mixed-cation effects. The authors discuss the relationship between local order and ion transport properties of borate glasses and vitreous electrolyte systems. (22 refs.)

108037 Effect of LiX (X=F, Cl, Br, I) and Na_2SO_4 on the electrical conductivity of Li_2SO_4:Li_2CO_3 eutectic. V.K.Deshpande, K.Singh (Dept. of Phys., Nagpur Univ., Nagpur, India).
Solid State Ionics (Netherlands), vol.8, no.4, p.319-22 (July 1983).
The effect of addition of LiX (X=F, Cl, Br, I) and Na_2SO_4 on the electrical conductivity of the eutectic composition of Li_2SO_4 and Li_2CO_3 has been studied. The eutectic composition with 10 mol.% Na_2SO_4 gives high conductivity and this could be applied in power sources. (11 refs.)

108038 Atomic defects and diffusion in metals. R.W.Siegel (Materials Sci. Div., Argonne Nat. Lab., Argonne, IL, USA).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.533-40
The self-diffusion data for FCC and refractory BCC metals are briefly reviewed with respect to (i) the available monovacancy formation and migration properties and (ii) the high-temperature diffusion enhancement above that expected for mass transport via atomic exchange with monovacancies. While the atomic-defect mechanism for low-temperature self-diffusion can be attributed to monovacancies, the mechanisms responsible for high-temperature mass transport are not so easily defined at present; both divacancies and interstitials must be seriously considered. Possibilities for improving our understanding are discussed. (69 refs.)

108039 The effect of hydrostatic pressure on self-diffusion in silver and gold. H.Mehrer, G.Rein (Max-Planck-Inst. fur Metallforschung, Inst. fur Phys., Stuttgart, Germany).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.547-50
The pressure dependence of self-diffusion in silver and gold has been measured down to fairly low values of the diffusivities using radio-tracers in combination with a sputter-sectioning technique. At low enough temperatures the activation volumes of the monovacancy can be observed. The authors obtain 0.65 Ω (Ω=atomic volume) for Ag and 0.73 Ω for Au. In the case of Ag experiments were performed for a whole series of temperatures. The measured activation volumes increase from 0.65 Ω at 594K to about 0.9 Ω near the melting temperature. It is concluded that this result is mainly due to an increasing contribution of divacancies with increasing temperature. (14 refs.)

108040 An analysis of self-diffusion data in FCC metals. W.Schule (Materials Sci. Div., Joint Res. Centre, Ispra, Italy).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.551-3
The results of an analysis of self-diffusion data in copper, silver, gold, aluminium, nickel, and platinum are reported. It is found that the contribution of single and divacancy self-diffusion varies considerably from metal to metal and that a divacancy contribution is especially small in gold and relatively large in copper and silver, even below 700°C. A temperature dependency of the parameters Q_{1v}, Q_{2v}, D_{01}, and D_{02} can be excluded for all metals except perhaps for silver, a temperature dependency of which, however, is also unlikely. (16 refs.)

108041 Self-diffusion of ^{67}Cu in copper. S.Fujikawa, K.Hirano (Dept. of Materials Sci., Tohoku Univ., Sendai, Japan).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.554-7
The self-diffusion coefficients in copper were determined by the serial sectioning method using carrier-free ^{67}Cu electroplating and a precision microtome at twenty-four temperatures in the range between 992 and 1355K. The linear Arrhenius relationship rigidly holds in the overall temperature range of the present work except 1355K. The reliable values of the frequency factor and the activation energy of the self-diffusion in copper were determined using the mean value of the diffusivity at each temperature. The curvature in the Arrhenius plot of the self-diffusion in copper was discussed. (10 refs.)

108042 Isotope effect for self-diffusion in silver at low temperatures. H.Mehrer, F.Hutter (Inst. fur Theoretische & Angewandte Phys., Univ. Stuttgart, Stuttgart, Germany).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.558-61
The simultaneous diffusion of ^{105}Ag and ^{110}Ag in silver single crystals has been measured in the temperature range 625 to 870K using a sputtering-technique for serial sectioning of the specimens. In this range the diffusivities vary between 2.7×10^{-20} and 3.8×10^{-16} m^2s^{-1}. The present work is the first isotope effect experiment for very low diffusivities. The strength of the isotope effect fΔK is 0.75 and is independent of temperature within the experimental error. This indicates that in the low-temperature range self-diffusion is dominated by monovacancies (f=0.781) with a ΔK which is close to unity. (9 refs.)

108043 Isotope effect and diffusion of cadmium in copper. K.Hoshino, Y.Iijima, K.Hirano (Dept. of Materials Sci., Tohoku Univ., Sendai, Japan).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.562-5
Isotope effect for the diffusion of ^{109}Cd and ^{115m}Cd in Cu has been measured in the temperature range from 983 to 1309K. Based on the isotope effect data, the correlation factor f_i has been found to be 0.38 at 1309K and to decrease with decreasing temperature to 0.15 at 983K. In addition, the solute enhancement factor for the diffusion of ^{64}Cu in dilute Cu-Cd alloys at 1076K has been measured, and the relative jump frequencies of the Cd atom and neighbouring Cu atoms in the five-frequency model have been evaluated. The results suggest that the attraction between a Cd atom and a vacancy is highly strong in the copper matrix. (14 refs.)

108044 Diffusion in Ni-Sn dilute alloys. Y.Iijima (Dept. of Materials Sci., Tohoku Univ., Sendai, Japan), M.Kikuchi, K.Hoshino, K.Hirano.
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.566-9
Tracer diffusion coefficient of nickel and interdiffusion coefficient in Ni-Sn dilute alloys containing up to 7 at.% Sn at 1373K have been determined. From Kirkendall marker shifts in various couples consisting of pure Ni and Ni-Sn dilute alloys, the intrinsic diffusion coefficients have been determined. Combining the solute enhancement factor for solvent diffusion with the vacancy flow factor for interdiffusion, an appropriate numerical set of the correlation factor and the jump frequency ratios in the five-frequency model have been evaluated. The result suggests highly correlated jumps of a tin atom to a vacancy in nickel. (11 refs.)

108045 Solute-enhanced self-diffusion in FCC alloys. S.Ishioka, M.Koiwa, H.Nakajima (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.574-7
The diffusion coefficient of a random walker on an imperfect FCC lattice is calculated rigorously. The validity of the Howard-Manning treatment (1967) of the solvent-enhanced self-diffusion is discussed in the light of the result of calculations. (3 refs.)

108046 Mechanisms of the anomalous diffusion in β-zirconium and β-hafnium. C.Herzig, L.Manke, W.Bussmann (Inst. fur Metallforschung, Univ. Munster, Munster, Germany).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.578-81
Diffusion mechanisms for the explanation of anomalous diffusion are discussed. Diffusion and isotope effect experiments in β-Zr, β-Zr-Nb alloys, and β-Hf are reported. The results are interpreted by a vacancy mechanism which is enhanced by photon induced displacive fluctuations (ω-embryos) at lower temperatures. (25 refs.)

108047 Pulsed ion beam technique for measuring diffusion coefficient of a slow diffusant in polymers. T.Venkatesan, D.Edelson, W.L.Brown (Bell Labs., Murray Hill, NJ, USA).
Appl. Phys. Lett. (USA), vol.43, no.4, p.364-6 (15 Aug. 1983).
The determination of diffusion coefficients (D) of small molecules in a polymer for D below 10^{-10} cm^2 s^{-1} is a difficult measurement using conventional self-supporting polymer membrane techniques. The authors propose a new method for obtaining similar information by irradiating a polymer with a pulsed ion beam and studying the evolving gaseous products. Product molecules that are not limited by the rate of their production in the film tend to exhibit diffusion limited dynamical characteristics in their transient evolution from the surface. By numerically modeling the diffusion problem the authors can extract diffusion coefficients from the data. Since thin films (<1 μm) can be used in these experiments, diffusion coefficients less than 10^{-10} cm^2 s^{-1}, typical of many molecules in polymers, can be measured with ease. (8 refs.)

108048 Extremely rapid out diffusion of sulfur in InP. A.K.Chin, I.Camlibel, T.T.Sheng, W.A.Bonner (Bell Labs., Murray Hill, NJ, USA).
Appl. Phys. Lett. (USA), vol.43, no.5, p.495-7 (1 Sept. 1983).
During sealed ampoule annealing of *n*-type (S,Se,Sn)InP crystals at 550°C, an unexpected diffusion front was observed whose apparent diffusivity exceeded that of the rapidly diffusion Zn impurity by about two orders of magnitude. Using luminescence techniques, this diffusion front was correlated with changes in the ionized impurity level. In this letter, the authors show that for annealed InP:S (2×10^{18} cm^{-3}) crystals the donor profile obtained from cathodoluminescence (CL) intensity measurements corresponds to the ^{34}S profile obtained by secondary ion mass spectroscopy. Although dislocations are generally paths along which impurities can rapidly migrate, CL imaging shows that dislocations impede rather than enhance sulfur out diffu-

sion. Further study is required to determine the rapid out-diffusion mechanism. (10 refs.)

108049 Diffusion and redistribution of carbon in iron and its alloys during deformation. O.M.Smirnov, V.A.Lazarev (Inst. of Metall. & Phys. of Metals, Moscow, USSR).
Fiz. Met. & Metalloved. (USSR), vol.56, no.1, p.115-19 (July 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
It was found that the diffusion mobility and the nature of the distribution of carbon atoms in iron and in an iron-chromium alloy changed with the rate of deformation at 650 and 400°C. (10 refs.) *A.T.*

108050 Diffusion of carbon in amorphous alloy $Co_{70}Fe_5Si_{15}B_{10}$. S.G.Urytu, P.L.Gruzin (Inst. of Metall. & Phys. of Metals, Moscow, USSR).
Fiz. Met. & Metalloved. (USSR), vol.56, no.1, p.200-1 (July 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
The diffusion of carbon was studied by the radioisotope spectrometric method applied to an amorphous ribbon. The results yielded the temperature dependence of the diffusion coefficient in the range 200-400°C. (8 refs.) *A.T.*

108051 Diffusion of copper in explosion-deformed metals. A.N.Bekrenev (V.V. Kuibyshev Polytech. Inst., Kuibyshev, USSR).
Fiz. Met. & Metalloved. (USSR), vol.56, no.1, p.206-8 (July 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A study was made of the diffusion mobility of copper atoms in explosion-deformed nickel, titanium, and titanium alloy VT9. Preliminary deformation by explosion accelerated diffusion. A substructure with a high density of dislocations facilitated motion of diffusing atoms along dislocation tubes. At relatively low pressures (up to 10-20 GPa) the diffusion coefficient of copper in nickel and titanium increased when the pressure was raised. However, at high pressures the diffusion mobility decreased on increase in the pressure. The latter effect was due to dislocation complexes which acted as traps of the diffusing copper atoms. (6 refs.) *A.T.*

108052 Diffusion behavior in titanium-chromium hydrides. R.C.Bowman,Jr., B.D.Craft, A.Attalla (Monsanto Res. Corp., Miamisburg, OH, USA), J.R.Johnson.
Int. J. Hydrogen Energy (GB), vol.8, no.10, p.801-8 (1983).
NMR measurements of the proton relaxation times T_1, $T_{1\rho}$, and T_2 have been performed on the low (i.e. α-phase) and intermediate (i.e. α'-phase) hydrogen concentrations in CO-stabilized $TiCr_2H_x$ with both the hexagonal (C14) and cubic (C15) Laves structures. The relaxation times indicate rapid proton diffusion above 200K for all the $TiCr_2H_x$ phases; however, large differences in the diffusion activation energies are observed. This behaviour is structure sensitive and has been associated with variations between interstitial site occupancies and diffusion pathways for the C15 and C14 structures. The estimated 300K diffusion constants in the α'-phase of $TiCr_2H_x$ are comparable to the literature values for $HfV_2H_{2.1}$, $LaNi_5H_{6.5}$ and $PdH_{0.70}$ but are orders of magnitude larger than the proton diffusion constant in $TiFeH_{1.0}$. (31 refs.)

108053 Effect of argon ion sputtering of surface on hydrogen permeation through vanadium. M.Yamawaki, T.Namba, T.Yoneoka (Dept. of Nuclear Engng., Univ. of Tokyo, Tokyo, Japan), K.Shida, M.Kanno.
J. Nucl. Sci. & Technol. (Japan), vol.20, no.5, p.405-13 (May 1983).
In order to measure the hydrogen permeation rate through V with an atomically cleaned surface, an Ar ion sputtering apparatus has been installed in the hydrogen permeability measuring system. The permeation rate of the initial specimen was found to be increased by about one order of magnitude after Ar ion sputtering of its upstream side surface. Repeating of such a sputter-cleaning was not so much effective in increasing the steady state permeation rate as the initial sputtering was, but it accelerated the transient response rate by a factor of 2 or 3. The transient response rate was also accelerated by the increase of hydrogen pressure, but this effect tended to be diminished by the sputter-cleaning of specimen surface. The surface impurity layer on the downstream side of specimen was also inferred to act as a diffusion barrier affecting the steady state permeation rate. The present value of activation energy for hydrogen permeation through V at temperatures below 873K was the smallest one ever obtained, showing that the surface effect was minimised in the present study on the account of the surface sputter-cleaning in addition to the ultra high vacuum system. (11 refs.)

108054 The diffusion of silver in InP. R.Chauoui, B.Tuck (Dept. of Electrical & Electronic Engng., Univ. of Nottingham, Nottingham, England).
J. Phys. D (GB), vol.16, no.9, p.1721-35 (14 Sept. 1983).
The paper describes a large number of experiments in which radiotracer silver was diffused into the III-V semiconductor InP over a wide range of experimental conditions. Diffusion profiles were plotted. The diffusions were performed over the temperature range 550-900°C for diffusion times between 2 min and 97 h. The ambient phosphorus vapour pressure was also varied over a wide range. Most of the experiments were carried out on undoped material, but doped n-type, p-type and semi-insulating materials were also used. The results cannot be explained by any simple diffusion theory and it would appear that a rather complex set of phenomena is in operation during the diffusions. The variation of surface concentration with phosphorus vapour pressure implies either that the silver atoms occupy phosphorus sites or that they are involved in some complex when occupying lattice sites. The latter explanation is considered the more likely and the complex $(V_pAg_{In}V_p)$ is proposed as a possibility. The very fast diffusion which is observed strongly suggests that the silver atoms diffuse in the interstitial state and the ion Ag_I^+ is proposed as the most likely. At lower diffusion temperatures most of the atoms in the bulk of the semiconductor probably remain interstitial, but at higher temperature, some of them join the lattice. (19 refs.)

108055 Diffusivity of hydrogen and deuterium at low concentration in $Fe_{0.5}Ti_{0.5}$. G.Arnold, J.-M.Welter (KFA Julich, Julich, Germany).
Metall. Trans. A (USA), vol.14A, no.8, p.1573-7 (Aug. 1983).
The diffusion coefficients of hydrogen and deuterium were measured in the solid solution phase $Fe_{0.5}Ti_{0.5}H_x/D_x$ ($x<0.03$) in an absorption/desorption experiment with palladium coated bulk samples. The pressure and temperature ranges covered were 1 to 120 bar and 370 to 800K, respectively. For $x\to 0$, the diffusion coefficients obey Arrhenius laws. They are (in cm^2 per second with T in K): $10.1\times10^{-4}\times\exp\ (-5890/T)$ and $5.5\times10^{-4}\times\exp(-5710/T)$ for hydrogen, $8.2\times10^{-4}\times\exp(-6080/T)$ and $5.5\times10^{-4}\times\exp(-5980/T)$ for deuterium, as measured during absorption and desorption, respectively. The pick-up and release of hydrogen by uncoated samples was controlled predominantly by surface effects. (15 refs.)

108056 Superdiffusion of 4*T*-hydrogen in vanadium. T.Suzuki, H.Namazue, S.Koike, H.Hayakawa (Dept. of Appl. Phys., Sci. Univ. of Tokyo, Tokyo, Japan).
Phys. Rev. Lett. (USA), vol.51, no.9, p.798-800 (29 Aug. 1983).
Room-temperature X-ray diffuse scattering experiments are reported for hydrogen in solution in vanadium. Uniaxial stress (below the elastic limit) results in transformation of all hydrogen atoms from 1*T* into 4*T* states; each hydrogen is delocalized over four neighboring *T* sites via tunneling. The diffusion coefficient of the 4*T* hydrogen, D_{4T}, is measured from 340 to 200K under an external ⟨111⟩ stress. It is extraordinarily large as compared to the existing data and satisfies the relation $D_{4T}=D_0\exp(-E/kT)$, where $D_0=1.6\times10^{-3}$ cm^2/s and $E=6$ meV. (6 refs.)

108057 Diffusion induced grain boundary migration in Ni-C alloys. T.A.Parthasarathy, P.G.Shewmon (Dept. of Metall. Engng., Ohio State Univ., Columbus, OH, USA).
Scr. Metall. (USA), vol.17, no.7, p.943-6 (July 1983).
The authors report an observation of diffusion induced grain boundary motion in which the solute is an interstitial. It is shown that at 600°C carbon diffuses along nickel grain boundaries orders of magnitude faster than through the lattice. (13 refs.)

108058 Diffusion of zinc into ion implanted iron doped indium phosphide. P.N.Favennec, L.Henry, M.Salvi, A.M.Huber, G.Morillot (CNET, Lannion, France).
Solid-State Electron. (GB), vol.26, no.8, p.771-5 (Aug. 1983).
A study has been made on the diffusion of zinc into iron-doped InP slices which have been previously implanted with various ion species. Chemical profiles of zinc and iron and hole profiles have been measured. The profiles depend strongly on the implanted ion species (argon, oxygen, fluorine, chlorine). The results cannot be attributed solely to radiation damage, but suggest the chemical influence of the particular ion species of the zinc diffusion mechanism. During the indiffusion of zinc from the surface to the bulk, there is, in the same time, a diffusion of iron in an opposite direction. The rearrangement of the iron distribution is mainly due to the presence of zinc impurities. (15 refs.)

108059 Hydrogen mobility in crystalline and amorphous Zr_2PdH_x. R.C.Bowman,Jr., A.Attalla (Monsanto Res. Corp.-Mound, Miamisburg, OH, USA), A.J.Maeland, W.L.Johnson.
Solid State Commun. (USA), vol.47, no.10, p.779-82 (Sept. 1983).
NMR measurements of proton rotating-frame relaxation times were made to deduce hydrogen diffusion parameters for crystalline and amorphous Zr_2PdH_x. Enhanced proton mobility was observed in glassy a-Zr_2PdH_x sample. Both host crystal structure and $Zr_2PdH_{2.9}$ relative to diffusion behavior in any crystalline proton site occupancy make significant contributions to the diffusion process where smaller activation energies correspond to jumps involving octahedral sites. (14 refs.)

108060 Behavior of liquid inclusions in a crystal in the force field of a centrifuge. V.S.Kruzhanov, L.V.Starukhina (State Univ., Khar'kov, Ukrainian SSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.2, p.217-19 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.372-6 (March-April 1983). [received: Sept. 1983]
The authors have investigated the motion and deformation of inclusions of aqueous solution in a KCl crystal in the 'gravitational' field of a centrifuge. The velocity and shape of the inclusions depend on their dimensions. As the dimensions of the inclusions increase, there is a transition from motion governed by processes at the crystal-solution boundary to diffusion-limited motion. The authors give a qualitative theoretical description of the observed phenomena. (8 refs.)

108061 Study of helium diffusion in calcium fluoride using a mass spectrometer under static conditions. E.V.Popov, A.Ya.Kupryazhkin (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.224-5 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.365-8 (Feb. 1983). [received: Sept. 1983]
Because of low diffusion mobility and solubility of helium in calcium fluoride crystals and the high background noise from the measurement chambers (gas given off by the chamber walls) in desorption experiments, accurate determination of solubility and diffusion coefficients is impossible using a mass spectrometer under dynamic conditions. In order to eliminate background noise, the samples must be specially prepared (saturated) and the amount of degassing in different, separated chambers in the diffusion cell must be measured. In order to improve the sensitivity of the mass spectrometer, it is advisable to record the gas sample (accumulation of gas in a closed volume) under static conditions. The authors designed and built a diffusion cell consisting of two parts, a saturation and a measurement chamber. (9 refs.)

108062 Fast diffusion of copper (I) ions in NaI. K.Budde (Abteilung Chem., Ruhr-Univ., Bochum, Germany).
Solid State Ionics (Netherlands), vol.8, no.4, p.341-7 (July 1983).
Results are presented for NMR investigations into the diffusion of Cu^+ in NaI. The NMR results show that a considerable amount of the copper (I) ions is incorporated interstitially and that the mean jump frequency ν_{Cu} of the Cu^+ ions is much higher than that of the host cations: $^{\nu}Cu/^{\nu}Na\approx 820$ at 320°C. Two values for the temperature dependence of ν_{Cu} are found: $E_1=1.63$ eV ($T<300$°C) and $E_2=0.61$ eV ($T>300$°C). The nature of the mechanism of the Cu^+-migration in NaI is discussed and a model proposed. The interstitial incorporation and fast diffusion of the Cu^+ ions is confirmed by a comparison with the results for CdI_2 doped NaI. CdI_2 is incorporated substitutionally and the mean jump frequency ν_{Cd} is lower than that of the host ions: $\nu_{Cd}<10^8$ s^{-1} at 650°C. For the pure substance conductivity measurements were performed too, for comparison. The agreement of NMR and conductivity data is good. From both $\Delta H_m=0.59$ eV and $\Delta H_s=2.08$ eV were calculated in excellent agreement with recently reported data. It is shown that the presence of oxygen in the samples leads to wrong data. A method for removing this impurity is described. (36 refs.)

108063 Impurity redistribution studies on laser-formed silicides. A.S.Wakita, T.W.Sigmon, J.F.Gibbons (Stanford Electronics Labs., Stanford, CA, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.721-6
$^4He^+$ backscattering and SIMS were used to study impurity redistribution during laser formation of refractory silicides. Thin films of Mo and W were evaporated on to ⟨100⟩ p-type silicon substrates, which were As or B implanted to doses of 1×10^{15} to 1×10^{16} cm^{-2}. These samples were laser reacted with multiple or single laser scans at various powers. Analysis of these films indicate impurity movement into the forming silicide layer. Impurity concentrations in the films were observed to be as high as 7.8×10^{20} cm^{-3} for As in WSi_2, however a reduction in this concentration occurred with subsequent thermal annealing. (4 refs.)

108064 Diffusion of helium in metals. W.Schilling (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.303-8
The experimental information presently available on the interstitial migration energies, dissociation energies from vacancies and effective activation energy for diffusion at high temperature of helium in metals is reviewed. From a discussion of these energies it can be concluded that in the FCC metals

nickel, gold and aluminum helium occupies predominantly substitutional sites, also in thermal equilibrium at high temperatures. For the BCC metals, molybdenum and tungsten, the evidence is more for interstitial occupancy in thermal equilibrium. The diffusion mechanism at high temperatures has been clearly identified for nickel as the dissociative mechanism (dissociation of a substitutional helium into interstitial helium plus vacancy and rapid migration of the interstitial helium until retrapping at another vacancy). Also for gold the dissociative mechanism seems to hold whereas for aluminum the normal vacancy mechanism seems to prevail. (18 refs.)

108065 Migration of implanted He in stainless steel as observed by trapping at ^{111}In atoms. M.Deicher, G.Grubel, T.Wichert (Fakultat fur Phys., Univ. Konstanz, Konstanz, Germany).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.309-11
Radioactive ^{111}In atoms are implanted in stainless steel (Ni 72/Cr 16/Fe 8) at room temperature. In contrast to pure metals no distinct In-defect complexes are observed with help of the PAC technique. When He atoms are implanted subsequently to the In atoms the formation of several In-He complexes is observed after annealing at 800K. The results are compared with those obtained in He release experiments. (5 refs.)

108066 Jump frequency analysis on impurity diffusion in Cu based on new data. K.Hirano (Dept. of Materials Sci., Tohoku Univ., Sendai, Japan).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.541-6
Using new experimental data on the enhancement factor, the vacancy flow factor and the isotope effect, an appropriate numerical set of the correlation factor and the three kinds of jump frequency ratios for the five frequencies have been estimated for the impurity diffusion of polyvalent elements (Zr, Cd, In, Sr and Sb) in Cu. It can be concluded that the attraction between an impurity atom such as Cd, In, Sn or Sb and a vacancy in Cu is highly strong, and a vacancy makes many consecutive exchanges in an impurity atom (Cd, In, Sn or Sb) rather than with any solvent atom neighbouring the vacancy. The attraction between the Zn atom and a vacancy is rather weak. (33 refs.)

108067 Application of a solvation shell analysis to the diffusivity of an interstitial species in binary substitutional solutions. D.Farkas (Dept. of Materials Engng., Virginia Polytech. Inst., Blacksburg, VA, USA).
J. Phys. & Chem. Solids (GB), vol.44, no.9, p.899-904 (1983).
A model is presented for the effect of substitutional solute elements on the diffusion coefficient of an interstitial species for low concentrations of both solutes. The model is based on the theory of absolute reaction rates and a Wagner random, noninteractive model for the substitutional solution, with Maxwell-Boltzmann statistics for the distribution of the interstitial atoms. Simplifying assumptions are made concerning the configuration of activated complexes, treating them as formed by the interstitial atom and the two nearest lattice atoms. The calculations are compared with experimental data reviewed for the diffusivity of carbon in Fe-Cr, Fe-Mn, Fe-Co and Fe-Ni alloys. (14 refs.)

108068 'Uphill' diffusion of vacancies and the instability of irradiated materials. Yu.N.Devyatko, V.N.Tronin (Moscow Engng.-Phys. Inst., Moscow, USSR).
JETP Lett. (USA), vol.37, no.6, p.330-3 (20 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.6, p.278-81 (20 March 1983). [received: Sept. 1983]
A mechanism is proposed for the 'uphill' diffusion of vacancies against the gradient of a substitutional impurity. The influence of this diffusion of mechanism is manifested in the possibility of unstable behavior arising in the irradiated material. (3 refs.)

66.30N Chemical interdiffusion

108069 Initial reactions at the interface of Pt and amorphous silicon. R.J.Nemanich, M.J.Thompson, W.B.Jackson, C.C.Tsai, B.L.Stafford (Xerox Palo Alto Res. Center, Palo Alto, CA, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.519-23 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
The initial reactions at the interface of Pt on *a*-Si:H are probed by interference enhanced Raman scattering, TEM, and Auger, and the atomic structural changes are correlated with electrical properties determined from current-voltage and internal photoemission measurements. It is shown that a disordered Pt-Si intermixed phase of less than 20 Å thick exists at the interface immediately after deposition, and this phase grows thicker with annealing to 150°C. Annealing at 200°C causes the nucleation of crystalline silicide phases. The Schottky diodes exhibit rectification over greater than ten orders of magnitude of current density. Initially, the as-deposited diodes exhibit an ideality parameter of $\sim$1.11. Subsequently, the value drops to 1.04 as the silicide develops. Internal photoemission results indicate deviations from expected behavior. (14 refs.)

108070 Modulation of atomic interdiffusion at the Si(111)-Au interface. A.Franciosi, D.G.O'Neill, J.H.Weaver (Dept. of Chem. Engng. & Materials Sci., Univ. of Minnesota, Minneapolis, MN, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.524-9 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
The authors attained a wide modulation of the Si(111)-Au interface reaction by deposition of controlled amounts of Cr on the semiconductor surface before in situ junction formation. Synchrotron radiation photoemission studies show that Cr deposition gives rise to a Si/Cr reacted interlayer that dramatically affects the subsequent Si-Au interdiffusion. Negligible interdiffusion of Cr and Au atoms was found in all cases so that the Si-Au intermixing depends upon an exchange reaction at the Si/Cr-Au interface in which Si is the only moving species. Large reduction of the interdiffusion occurs sharply above a critical value of Cr deposition (10 monolayers) that corresponds to a fully reacted Si(111)-Cr interface. (29 refs.)

108071 Similarities in chemical intermixing at the Cu/InP and Cu/Si interfaces. T.Kendelewicz, G.Rossi, W.G.Petro, I.A.Babalola, I.Lindau, W.E.Spicer (Stanford Electronics Labs., Stanford Univ., Stanford, CA, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.564-9 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
In this work the authors present a comparative study of the electronic and atomic structure of the interactive Cu/Si and Cu/InP interfaces. They use surface sensitive techniques, including soft X-ray photoemission and photon- and electron-induced Auger electron spectroscopy (AES), to show the strikingly similar chemical reactions and electronic properties at both interfaces. For both Cu/Si and Cu/InP, the valence band spectra and core level intensity profiles show intermixing of the metal with the substrate atoms. Moreover, for both semiconductors, the increase in Cu coverage induces an increase of the width of the Si$L_{2,3}VV$($\sim$92 eV) and P$L_{2,3}VV$($\sim$120 eV) Auger peaks at the earliest stage of barrier formation followed by a 4.4 eV splitting for higher coverages. These experimental observations lead to very similar models of the chemical reaction at the interface and the formation of the intermixed region and indicate bonding between Cu and P or Si for the InP and Si interfaces. In the case of the Cu/InP interface, the authors observe segregation of In to the surface and the formation of metallic islands. (14 refs.)

108072 Auger depth profiling studies of interdiffusion and chemical trapping at metal-InP interfaces. Y.Shapira, L.J.Brillson (Xerox Webster Res. Center, Webster, NY, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.618-22 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
The authors have used Auger electron spectroscopy (AES) combined with Ar^+ sputtering to profile the chemical composition of UHV-cleaved InP(110) interfaces with Au, Al, Cu, Ni, Ti, and Ag films. They observe pronounced anion and cation segregation to the free metal surface which depend sensitively on the metal-InP reactivity. Reactive metal (e.g. Al, Ti or Ni) interlayers at Au-InP interfaces decrease anion diffusion and surface segregation monotonically with increasing interlayer thickness and AES depth profiles indicate a P accumulation at or just below the intimate metal-InP interface. These and other sputter-AES studies suggest that the lower (higher) Schottky barriers of reactive (unreactive) metals are associated with cation (anion) depletion within the InP bulk and on anion accumulation at the intimate InP-metal interfaces. (23 refs.)

108073 Room temperature exchange reaction at the Al-InP (110) interface: soft X-ray photoemission studies. T.Kendelewicz, W.G.Petro, I.A.Babalola, J.A.Silberman, I.Lindau, W.E.Spicer (Stanford Electronics Labs., Stanford Univ., Stanford, CA, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.623-7 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
A room temperature exchange reaction between an Al adsorbate and In atoms from the InP(110) surface has been observed during the early stages ($\sim$0.5 to 5 Å) of interface formation by means of soft X-ray photoemission spectroscopy of the Al 2*p* in In 4*d* core levels. As much as 8 Å of deposited Al was found to be required to slow down the transport of Al metal to the front of the reaction to the extent that an overlayer of nonreacted Al metal began to be observed on the surface. For all stages of barrier formation a segregation of In atoms, monitored by the chemical shift of the In 4*d* core lines, has been observed. A moderate heating (up to 200°C) of a 12 Å deposition extends the exchange reaction deeper into the bulk. These results are discussed in the context of the widely studied Al-GaAs interface. (20 refs.)

108074 Effect of high pressure on interdiffusion in an Al-Mg alloy. Y.Minamino, T.Yamane, A.Shimomura (Dept. of Material Sci. & Engng., Osaka Univ., Osaka, Japan), M.Shimada, M.Koizumi, N.Ogawa, J.Takahashi, H.Kimura.
J. Mater. Sci. (GB), vol.18, no.9, p.2679-87 (Sept. 1983).
Interdiffusion in the Al-4.06 at.% Mg alloy has been investigated under high pressure in the temperature range 690 to 877K. The diffusion coefficients decreased with pressure. The activation volume and energy of interdiffusion were determined. (39 refs.)

108075 The effect of the grain structure of Al_2O_3 substrate on the solid state reaction with a layer of NiO: a comparative backscattering spectrometry study. I. G.de Roos (Dept. of Phys., State Univ. Utrecht, Utrecht, Netherlands), J.H.W.de Wit, J.M.Fluit, J.W.Geus.
Surf. & Interface Anal. (GB), vol.5, no.4, p.167-9 (Aug. 1983). (International Conference on Quantitative Surface Analysis, Teddington, England, 24-25 Nov. 1981).
The solid state reaction of Al_2O_3-NiO reaction couples was investigated by means of Rutherford backscattering spectrometry. NiO films on the alumina substrates were obtained by vapour-deposition of Ni and subsequent oxidation at 800°C in air. Substrates of about the same surface roughness, thus providing equal contact areas for the reaction couples, were used. The materials were characterized by scanning electron microscopy. In spite of the different structure and a grain size that varied within a factor of 10, of the Al_2O_3 materials, no obvious difference in the spectra based on the used reaction couples could be detected. Suggested substantial contribution to the reaction from surface diffusion and grain boundary diffusion along the substrate grain boundaries could therefore be rejected. (4 refs.)

108076 Dipole driven diffusion across polar heterojunction interfaces. E.A.Kraut (Microelectronics Res. & Dev. Center, Rockwell Internat., Thousand Oaks, CA, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.643 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Summary form only given. It is suggested that abrupt polar Ge-GaAs heterojunction interfaces may tend to grow in such a way as to match the average bulk Ge potential to the average bulk GaAs potential using only a few transition planes to accomplish this. The degree to which the crystal fails to completely eliminate the interface dipole is a measure of the variation of the polar valence band discontinuity ΔE_v from that for the abrupt nonpolar Ge-GaAs (110) heterojunction. The mechanism which the crystal may employ to eliminate the interface dipole could possibly involve electric field enhanced diffusion in the transition region separating bulk Ge from bulk GaAs. (6 refs.)

66.60 THERMAL CONDUCTION IN NONMETALLIC LIQUIDS

(for thermal conduction in liquid metals, see 72.15C)

108077 Thermal conductivity of carbon disulphide at pressures up to 500 MPa. U.V.Mardolcar, W.A.Wakeham (Dept. of Chem. Engng. & Chem. Technol., Imperial Coll., London, England).
Int. J. Thermophys. (USA), vol.4, no.1, p.1-10 (March 1983).
Presents new, absolute measurements of the thermal conductivity of carbon disulphide in the temperature range 36-74°C and the pressure range 40-500 MPa. The measurements have been carried out in a transient hot-wire instrument, and the radiation-free thermal conductivity reported has an estimated uncertainty of ±0.5%. The correction for the contribution to heat transfer arising from absorption of radiation is particularly small for carbon disulphide, and it is proposed as a suitable standard reference material for liquid thermal conductivity. (19 refs.)

108078 Thermal conductivity measurement of n-butane over wide temperature and pressure ranges. C.A.Nieto de Castro (Dept. de Quimica, Faculdade de Ciencias, Univ. Lisboa, Lisboa, Portugal), R.Tufeu, B.Le Neindre.
Int. J. Thermophys. (USA), vol.4, no.1, p.11-33 (March 1983).
The thermal conductivity of n-butane has been measured by a coaxial-cylinder method over a pressure range from 0.1 MPa up to 70 MPa and a temperature range from room temperature to 600K, covering all fluid states. The estimated accuracy of the method is about 2%. Special emphasis has been given to the behaviour of the thermal conductivity near the critical point, and the critical enhancement has been studied for $3.6K<\Delta T<176K$. The effect of inelastic collisions upon transport properties of the dilute gas has been discussed. The results obtained for the reduced critical enhancement as a function of the reduced critical temperature confirm the universality of the critical exponent, for the n-alkanes, whereas the reduced excess thermal conductivity outside the critical region is a function of the reduced density and of the n-alkane. (25 refs.)

108079 Thermophysical characteristics of aprotonic solvents and electrolytes based on them. I.G.Gurevich, K.B.Gisina, V.K.Shchitnikov, B.I.Tumanov (A.V. Lykov Inst. of Heat & Mass Transfer, Acad. of Sci., Minsk, Belorussian SSR).
J. Eng. Phys. (USA), vol.43, no.4, p.1132-5 (Oct. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.4, p.623-6 (Oct. 1982). [received: Sept. 1983]
Measured and computed values of the thermal conductivity and heat capacity of a number of organic solvents and electrolytes based on them are presented. (7 refs.)

108080 Thermal conductivity of methyl and butyl propionates at various temperatures and pressures. T.F.Klimova, K.D.Guseinov (Azerbaidzhan State Pedagogical Inst., Azerbaidzhan SSR).
J. Eng. Phys. (USA), vol.43, no.4, p.1135-9 (Oct. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.4, p.626-30 (Oct. 1982). [received: Sept. 1983]
Experimental data are presented on the thermal conductivities of methyl and butyl propionates in the liquid and gaseous phases, including the saturation line, over the temperature range 300-600K and pressures of 0.1-50 MPa. (12 refs.)

66.70 NONELECTRONIC THERMAL CONDUCTION AND HEAT-PULSE PROPAGATION IN NONMETALLIC SOLIDS

(for thermal conduction in solid metals, see 72.15C and 72.15E; for statistical mechanics of lattice vibrations, see 63.70)

108081 Observation of thermal conductivity anomaly of thallium halides. Y.Suemune (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2816-19 (Aug. 1983).
Temperature dependence of thermal conductivities of thallium halides, TlCl and TlBr has been measured below room temperature. The thermal conductivities of both compounds were found to show an anomalous behavior apparently different from the typical lattice thermal conductivity behavior. The first was the occurrence of a broad conductivity minimum near 200K unlike other alkali halides showing the usual inverse temperature dependence above 100K or so. The second was lower magnitude of the conductivities than those of the usual high-purity alkali halides by an order or two. These unusual characteristics are not satisfactorily understood by any conventional models with regard to several phonon scattering mechanisms in dielectric materials. (11 refs.)

108082 Thermal transport in heavily deformed and γ-irradiated LiF at temperatures near 1K. E.J.Cotts, S.E.Shore, A.C.Anderson (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).
J. Phys. & Chem. Solids (GB), vol.44, no.9, p.865-8 (1983).
The thermal conductivity κ of heavily deformed LiF crystals has been measured at temperatures $T \gtrsim 0.5$K following exposure of the sampls to γ irradiation. The results are in agreement with recent measurements of ballistic phonon propagation in similar samples at an equivalent temperature of $\approx$4K. A fraction of the phonons have a mean free path of order 1 cm in the heavily deformed crystal, and γ-irradiation increases the fraction having a long mean free path. The measurements support a dynamic (as opposed to static) model of phonon-dislocation interaction. (13 refs.)

108083 Optoacoustic effect and the thermal diffusivity of solids. S.A.Vinokurov.
J. Eng. Phys. (USA), vol.44, no.1, p.50-5 (Jan. 1983). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.44, no.1, p.60-6 (Jan. 1983). [received: Sept. 1983]
An optoacoustic method for determining the thermal diffusivity is investigated theoretically. The results are confirmed by experimental data. (7 refs.)

108084 Thermal conductivities of a cracked solid. A.Hoenig (Dept. of Math., John Jay Coll. of Criminal Justice, New York, NY, USA).
J. Compos. Mater. (USA), vol.17, no.3, p.231-7 (May 1983).
Formulas are presented which describe the effect of flat elliptical cracks on the effective thermal conductivity of an otherwise homogeneous body. The cracks are assumed randomly and isotropically distributed throughout the body, and may either be dry or composed of any material with a conductivity differing from that of the matrix. Effective conductivities depend solely upon a crack density parameter when the cracks are dry, and additionally upon a saturation parameter and the crack planform aspect ratio otherwise. (8 refs.)

108085 Study of thermal properties, electrical conductivity, and the crystallization process of the glassy alloy $SeGe_{20}$. A.A.El-Sharkawy, M.S.Zaghloul, A.M.Sanad (Dept of Phys., Al-Azhar Univ., Cairo, Egypt).
Phys. Status Solidi a (Germany), vol.78, no.2, p.457-62 (16 Aug. 1983).
The samples are prepared by introducing 5% of selenium in pure germanium. The samples are subjected to heat treatment at temperatures of 80, 90 and 100°C. These temperatures are selected by differential thermal analysis (DTA). After annealing of the samples at these temperatures, the electrical conductivity σ_{20} at 20°C, the activation energy E_g of the conductivity process, and the density d are determined and taken as a measure of the crystallization rate of the annealed samples. The crystallization process depends on the selected annealing temperature and also on the time of annealing. The estimated value of activation energy of the crystallization of the process is equal to 9.55×10^4 J/mol. It is found also that the process of crystallization of the annealed glassy alloy $SeGe_{20}$ is one-dimensional. The thermal properties (thermal conductivity λ, thermal diffusivity a, and specific heat capacity c_p) of the heat treated $SeGe_{20}$ at temperature 100°C are measured. It is found that the main mechanism of heat transfer is due to phonons. The calculated values of the role of electrons and bipolars are very small. (7 refs.)

108086 Effect of empty spaces on the lattice thermal conductivity of noncrystalline material at low temperatures: Application to borosilicate glass. K.S.Dubey (Dept. of Phys., Coll. of Sci., Univ. of Basrah, Basrah, Iraq).
Phys. Status Solidi a (Germany), vol.78, no.2, p.K195-200 (16 Aug. 1983).
The lattice thermal conductivity (LTC) of a noncrystalline material decreases monotonously with decreasing temperature below room temperature and it becomes nearly temperature independent near 10K which is known as the plateau temperature. The author studies the effect of scattering of phonons by the empty spaces on the LTC of a noncrystalline material at low temperatures, by calculating the LTC of borosilicate glass in the temperature range 0.04 to 1.5K for five different values of the empty space scattering strength. The separate percentage contributions % K_{BE} and % K_{EM} have also been studied. (K_{BE} is the contribution due to those phonons which can interact with the crystal boundaries, and K_{EM} that due to those phonons which can interact with the empty spaces but cannot interact with the crystal boundaries). (20 refs.)

108087 Influence of defects of chemical structure of polyimides on their thermal resistance. A.K.Mikitaev, A.S.Beriketov, A.S.Korshak, A.Zh.Taova.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.8, p.1691-6 (Aug. 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
The thermal resistance of the range of polyimides has been evaluated as a function of the composition of the model copolymer: polyimide+defect. The repeat-unit heterogeneity is shown to decrease the thermal resistance. The same defects (bridge groups) depending on their nature and geometry are shown to have the contrary effect on thermal characteristics. This fact should be taken into account for prediction of properties of polyimides. (18 refs.)

108088 Influence of helium I layer formation on the copper-helium-4 Kapitza resistance at helium II bath temperatures. Y.I.Kim, Li-He Lin, C.Chuang, T.H.K.Frederking (Univ. of California, Los Angeles, CA, USA).
Appl. Phys. Lett. (USA), vol.43, no.5, p.451-3 (1 Sept. 1983).
The transient Kapitza resistance between copper and helium II caused by a step input in power has been studied near 2K. The resistance is affected by formation of a helium I layer whose thickness, of the order 10^{-4}-10^{-5} cm, is evaluated as a function of the heat flux density. (9 refs.)

108089 Paired-phonon analysis of impurities in bose fluids. K.E.Kurten, M.L.Ristig (Inst. fur Theoretische Phys., Univ. zu Koln, Koln, Germany).
Nuovo Cimento D (Italy), vol.2D, ser.1. no.4, p.1057-64 (July-Aug. 1983).
The paired-phonon analysis for boson mixtures is employed in conjunction with the hypernetted-chain approximation to study the ground-state properties of an impurity embedded in liquid ^{4}He. Chemical potentials, volume coefficients and other thermodynamic quantities as well as some of the most interesting optimal correlation functions are calculated for various impurities interacting with the ^{4}He background atoms via Lennard-Jones potentials of differing strength. (13 refs.)

108090 Superheat limit of ^{4}He and its quantum deviation from classical behavior. K.Nishigaki, Y.Saji (Kobe Univ. of Mercantile Marine, Kobe, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2293-6 (July 1983).
The superheating of normal liquid ^{4}He was investigated by means of continuous heating of a liquid specimen in a small glass capillary over a temperature range 2.26K to 4.88K. The maximum superheating data obtained were compared with the prediction from the homogeneous nucleation theory and the data for various liquids in terms of the reduced coordinates. It is confirmed that the agreement between the homogeneous nucleation theory and experiment on ^{4}He is satisfactory, and the scaled superheating depends parametrically on the quantum parameter Λ^*, i.e. the deviations of the data for quantum liquids from the classical behavior become pronounced as the parameter is increased.

108091 Hydrodynamics and heat transfer in superfluid helium. S.K.Nemirovskii (Thermophys. Inst., Acad. of Sci., Novosibirsk, USSR).
J. Eng. Phys. (USA), vol.43, no.4, p.1172-86 (Oct. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.4, p.676-92 (Oct. 1982). [received: Sept. 1983]
Presents a survey intended to describe the present status of the hydrodynamics of a superfluid liquid. Attention has been concentrated mainly on questions related to heat transfer is a volume of He II. (30 refs.)

108092 Superfluidity in a dilute bose gas. B.C.Crooker, B.Hebral, E.N.Smith, Y.Takano, J.D.Reppy (Lab. of Atomic & Solid State Phys., Cornell Univ., Ithaca, NY, USA).
Phys. Rev. Lett. (USA), vol.51, no.8, p.666-9 (22 Aug. 1983).
Superfluid ^{4}He films adsorbed on porous Vycor glass have been studied in the low-density limit where the superfluid interparticle spacing is more than an order of magnitude greater than the atomic hard-core diameter. For the lowest transition temperatures observed, the influence of critical fluctuations near T_c is much reduced and a range of crossover to behavior more characteristic of the dilute Bose gas is observed. (6 refs.)

108093 Electronic structure of multielectron bubbles in liquid helium. M.M.Salomaa (Low Temperature Labs., Helsinki Univ. of Technol., Epsoo, Finland), G.A.Williams.
Phys. Scr. (Sweden), vol.T4, p.204-7 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).
A quantum-statistical generalized Thomas-Fermi model is presented for the structure of multielectron bubbles observed in liquid helium-4 at low temperatures. The authors estimate bubbles with more than about 20 electrons to be stable against fissioning to single-electron bubbles. Electrons inside multielectron bubbles are found to concentrate in a narrow layer on the liquid helium surface. It is suggested that large bubbles in liquid helium constitute a new system and regime for testing electron density profiles; one which is quite clean from impurities, band structure effects and the background charge, all of which usually complicate the treatment of the electron density profile of metal surfaces. (16 refs.)

108094 Variational ground-state energy of liquid ^{4}He. B.Kumar, R.K.Srivastava (Dept. of Phys., Ranchi Univ., Ranchi, India).
Physica B & C (Netherlands), vol.121B+C, no.3, p.409-19 (Aug. 1983).
A rigorous upper bound on the ground-state energy of liquid ^{4}He is obtained by using a Bijl-type trial wave function, Penrose bounds on the classical pair distribution function and Morse-V_{DD} or LJ pair interactions. The two-body wave function is obtained from the Euler equation associated with the variational problem. The calculation gives a rigorous proof that the expectation energy per atom first decreases with increase of density, has a negative maximum and, then, increases with the density. The upper bound obtained on energy per atom is nearly 32% higher than the experimental value. (40 refs.)

108095 Elliptical multielectron dimples on liquid and solid helium surfaces. V.B.Shikin (Inst. of Solid State Phys., Acad. of Sci., Chernogolovka, USSR), P.Leiderer.
Solid State Commun. (USA), vol.47, no.4, p.269-71 (July 1983).
The structure of multielectron dimples on helium substrates is investigated for conditions deviating from axial symmetry. Main sources for an ellipticity of dimples are an anisotropy of the surface tension, as for the liquid-solid He interface, or anisotropic boundary conditions, as for liquid He between vertical parallel plates. (6 refs.)

108096 Relativistic hydrodynamics of a superfluid. V.V.Lebedev, I.M.Khalatnikov (L.D. Landau Inst. for Theoretical Phys., Acad. of Sci., Moscow, USSR).
Sov. Phys.-JETP (USA), vol.83, no.5, p.923-30 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1601-14 (Nov. 1982). [received: Sept. 1983]
The authors consider a relativistic generalization of the phenomenology describing a superfluid. Thermodynamic identities are derived for the pressure and energy density. A variational principle is constructed from which the nondissipative two-velocity equations of relativistic hydrodynamics can be derived. The equations are also expressed in Hamiltonian form. An expression for the energy-momentum tensor is found. The dissipative terms in the hydrodynamic equations are discussed. The low-velocity and zero-temperature limits are considered in detail. In the latter limit the equations for a rotating relativistic superfluid are derived and the normal modes of the vortex lattice are discussed. It is shown how to generalize the equations to the presence of a gravitational field. An application of the formalism to neutron stars is discussed. (16 refs.)

108097 Turbulence in superfluid ^{4}He. K.Yamada, J.Yamauchi.
Solid State Phys. (Japan), vol.18, no.5, p.279-304 (May 1983). In Japanese.
The recent development in vortex dynamics and turbulence in superfluid ^{4}He is reviewed. Particularly, the stress is on the critical velocity and the thermal counter flow turbulence. (16 refs.)

108098 Heat excitation of sound waves in liquid helium. V.N.Poroshin, B.A.Danilchenko.
Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1191-4 (Aug. 1983). In Russian.
Excitation of sound waves in liquid He is investigated for pulsed heating of the source. The investigation of the transient heat exchange of the heater with He bath shows that the excitation of sound waves is connected with He boiling near the heater surface. (9 refs.)

Conditioning effect of dielectric breakdown in liquid helium . See Entry 108875

67.50 FERMI FLUIDS; LIQUID HELIUM-3

108099 First observation of the Knudsen minimum in normal liquid ^{3}He. J.M.Parpia, T.L.Rhodes (Dept. of Phys., Texas A&M Univ., College Station, TX, USA).
Phys. Rev. Lett. (USA), vol.51, no.9, p.805-8 (29 Aug. 1983).
The viscosity of liquid ^{3}He contained in a 45-μm-high chamber has been studied. The slip correction and a clearly defined maximum in the effective viscosity are resolved in this experiment. The magnitude of the slip correction and the position of the maximum in the effective viscosity are found to be in disagreement with recent theoretical work. (12 refs.)

108100 Surface spin waves in ^{3}He-*B*. S.E.Korshunov (L.D. Landau Inst. of Theoretical Phys., Acad. of Sci., USSR).
Sov. Phys.-JETP (USA), vol.83, no.5, p.1034-6 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1788-93 (Nov. 1982). [received: Sept. 1983]
A dispersion equation for surface spin waves in the isotropic superfluid phase of ^{3}He (the *B*-phase) is derived and investigated. It is shown that the spectrum has an end point at small wave vectors k. The velocities of spin waves of various polarizations in a thin ^{3}He-*B* layer are calculated in the limit of large k. (5 refs.)

108101 The low temperature phases of ^{3}He. R.C.Richardson (Materials Sci. Center, Cornell Univ., Ithaca, NY, USA).
Alloy Phase Diagrams. Proceedings of a Symposium, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.361-4
In the temperature range between 1 mK and 3 mK and in magnetic fields between 0 T and 1 T, there are four distinct phases of liquid ^{3}He and three distinct phases of solid ^{3}He. The liquid becomes a triplet superfluid and the solid becomes a nuclear antiferromagnet. Despite the great differences which exist between a superfluid and an antiferromagnet, there are remarkable similarities between phase diagrams of the two systems. (9 refs.)

Fermi liquid theory of dilute submonolayer ^{3}He on thin ^{4}He II film: dimer bound state and Cooper pairs ....See Entry 108105

67.60 MIXED SYSTEMS; LIQUID HELIUM 3-4 MIXTURES

108102 Experimental results on phonon-quasiparticle interactions in dilute ^{3}He-^{4}He mixtures under pressure. L.P.J.Husson, C.E.D.Ouwerkerk, A.L.Reesink, R.de Bruyn Ouboter (Kamerlingh Onnes Lab., Rijksuniv. Leiden, Leiden, Netherlands).
Physica B & C (Netherlands), vol.122B+C, no.1, p.8-22 (Sept. 1983).
Measurements are presented on the diffusion of phonons in dilute ^{3}He-^{4}He mixtures in the temperature range between 50 mK and 400 mK, at molar ^{3}He concentrations between $X=5.5\times10^{-4}$ and $X=1.73\times10^{-3}$, and at pressures between $p=0.0$ MPa and $p=2.0$ MPa. The detected signals are described by an absorption and scattering parameter α, determined by the effective mean free path, and an absorption rate β. The results for α indicate a drastic increase of the phonon mean free path with pressure, The results for β indicate that the ^{3}He relaxation rate for viscosity τ_η does not depend on the pressure.

108103 Two-fluid effects in the convective instability of ^{3}He-^{4}He superfluid mixtures. V.Steinberg (Dept. of Phys., Univ. of California, Santa Barbara, CA, USA), H.R.Brand.
Phys. Rev. B (USA), vol.28, no.3, p.1618-20 (1 Aug. 1983).
The influence of two-fluid effects on the onset of convection in ^{3}He ^{4}He mixtures is discussed. The differences and similarities between the descriptions of Steinberg and Fetter are pointed out. The connections with recent experiments are also considered. (7 refs.)

108104 Long range effects on the longitudinal electron localization over a helium film. Yu.P.Monarkha.
Fiz. Nizk. Temp. (USSR), vol.9, no.8, p.789-94 (Aug. 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The behaviour of a peripheral electron over a dipole-electrified film has been theoretically studied. It is shown that, even without allowing for the polarization effects, the infinite dipole plane attracts the peripheral electron if the negative charges are closer to it than the positive ones are. It is concluded that over a helium film covering a metal plate the critical (maximum) surface electron concentration is attained even in the case of zero potential of the plate. It is shown also that in real experimental conditions a very large contribution to the transverse electron localization over the helium film covering the solid substrate is, because of the long range nature of the interaction potentials, provided by image forces of all neighbouring electrons. The effective holding field acting on an individual electron is calculated. (10 refs.)

108105 Fermi liquid theory of dilute submonolayer ^{3}He on thin ^{4}He II film: dimer bound state and Cooper pairs. K.Miyakje (Lab. for Low Temperature Phys., Univ. of Massachusetts, Amherst, MA, USA).
Prog. Theor. Phys. (Japan), vol.69, no.6, p.1794-7 (June 1983).
A degenerate dilute Fermi system, with a shallow dimer bound state, is discussed with attention to the possibility of Fermi superfluidity. (Necessary information on interaction is expressed through the bound state energy of the dimer.) A relevant system may be dilute submonolayer ^{3}He on a thin ^{4}He II film just above the onset of the apparent gas-liquid phase separation of ^{3}He. (14 refs.)

108106 Some phenomenological properties of helium films. H.van Beelen, G.Bannink (Kamerlingh Onnes Lab., Rijksuniv. Leiden, Leiden, Netherlands).
Physica B & C (Netherlands), vol.121B+C, no.1-2, p.30-40 (1983).
A brief review of the large variety of experimental investigations on the macroscopic properties of thin helium films is presented. It is shown that a phenomenological two-fluid model gives a satisfactory description of these properties, though at very small helium coverages a superfluid friction force must be introduced already at vanishingly small superfluid transport rates. The evidence that superfluidity in the very thin films is a manifestation of two-dimensional ordering is briefly discussed. (45 refs.)

67.80 SOLID HELIUM AND RELATED QUANTUM CRYSTALS

108107 X-ray studies of solid *n*-H_2. I.N.Krupskii, A.I.Prokhvatilov, G.I.Shcherbakov.
Fiz. Nizk. Temp. (USSR), vol.9, no.8, p.858-64 (Aug. 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The results of precise X-ray studies of normal hydrogen in the temperature range of 2K to the triple point are reported. Temperature dependences of the lattice parameters, molar volume, linear and volume expansion coefficients of *n*-H_2 are obtained. The increasing contribution to the thermal expansion of the crystal is revealed at decreasing temperature which is due to the presence of a rotational subsystem in *n*-H_2. It is shown that near the melting point the thermal expansion of *n*-H_2 similarly to that of *p*-H_2, is essentially of the anisotropic character. The thermodynamical properties of solid *n*-H_2 are analysed. The results obtained, prove the presence of the isomorphous phase transition in solid $n=H_2$ in the premelting region. (20 refs.)

108108 New high-pressure phase of solid ^{4}He is BCC. D.Levesque, J.-J.Weis (Lab. de Phys. Theorique de Hautes Energies, Univ. Paris-Sud, Orsay, France), M.L.Klein.
Phys. Rev. Lett. (USA), vol.51, no.8, p.670-3 (22 Aug. 1983).
The effect of isobarically heating solid ^{4}He at high density is investigated with use of constant-pressure molecular-dynamics calculations and a realistic interatomic pair potential. At $P \sim 16$ GPa the observed sequence of stable phases with increasing temperature is FCC→BCC→liquid. The presence of a new, thermally stabilized, BCC phase for high-density solid ^{4}He is thus confirmed. (20 refs.)

108109 High frequency NMR in BCC solid ^{3}He. M.E.R.Bernier, G.Guerrier (CENS, Gif-sur-Yvette, France).
Physica B & C (Netherlands), vol.121B+C, no.1-2, p.202-18 (1983).
The authors report a comprehensive experimental study of the spin lattice relaxation in bulk BCC solid ^{3}He at high Larmor frequency (200 MHz). The various temperature regimes for T_1 are investigated in connection with the results of low field experiments. At high temperature the modulation of the dipolar interaction by vacancies and atomic exchange motions gives a good account of the experimental data thus providing an answer to a question raised by several experiments: at high magnetic field (6.2T) the correlation function for the modulation of the dipolar interaction by the exchange of ^{3}He atoms remains well described by a Lorentzian function as deduced from low field experiments. At low temperature a plateau is observed and explained by the presence of dislocations in the solid, a model consistent with both low and high field experiments. The influences on T_1 of the ^{3}He-^{4}He phase separation in solid and of the melting of the solid at temperatures lower than the minimum of the melting curve are discussed using this model. (49 refs.)

108110 X-ray diffraction study of thermal vacancies in solid helium-3. S.M.Heald, D.R.Baer, R.O.Simmons (Dept. of Phys., Univ. of Illinois, Urbana-Champaign, IL, USA).
Solid State Commun. (USA), vol.47, no.10, p.807-10 (Sept. 1983).
Thermal vacancy concentrations in solid ^{3}He have been directly measured by X-rays over a wide range of molar volumes in the BCC phase and one molar volume in the HCP phase. Values of the vacancy free energies and free volumes of formation have been obtained, and comparison with NMR and ultrasonic studies yields information about vacancy motion in the two phases of the solid. 67.90 OTHER TOPICS IN QUANTUM FLUIDS AND SOLIDS (E.G. NEUTRON-STAR MATTER)

108111 Superfluid hydrodynamics in the weak interaction model. N.M.Lavrinenko, S.V.Peletminskii, Yu.V.Slyusarenko.
Fiz. Nizk. Temp. (USSR), vol.9, no.8, p.795-803 (Aug. 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
Equations of dissipative hydrodynamics for a superfluid with $\nu_k - u_k \neq 0$ (ν_k, u_k are the velocities of super and normal components, respectively) are derived. It is shown that the system in this case is described by 14 kinetic coefficients. The low temperature asymptotics of all these coefficients for $\nu_k - u_k \neq 0$ is considered. (7 refs.)

108112 Image forces and electron spectrum at the surface of liquid helium. A.M.Gabovich, L.G.Il'chenko, E.A.Pashitskii (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Surf. Sci. (Netherlands), vol.130, no.2, p.373-94 (Aug. 1983).
On the basis of the longitudinal field Green function, in a three-layer nonsymmetrical system of media with spatial dispersion the image-force potential is calculated for surfaces of the semi-infinite helium bath and a liquid helium film, and also for a surface of the phase-separated ^{3}He-^{4}He mixture. The dependence of the surface electron spectrum on the film thickness and on the pressing electric field strength is analysed. (45 refs.)

68.10 FLUID SURFACES AND INTERFACES WITH FLUIDS

(inc. surface tension, capillarity, wetting and related phenomena)

108113 Measurement of the dynamic surface tension of solutions of surface-activity substances. I.S.Kisil', M.M.Dranchuk, R.T.Bodnar, A.G.Mal'ko (Ivano-Frankovsk Inst. of Oil & Gas, USSR).
Ind. Lab. (USA), vol.48, no.11, p.1109-13 (Nov. 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.11, p.48-50 (Nov. 1982).
Special attention is given to the method of maximum pressure in the gas bubble in which the gas bubble is forced out of a calibrated opening into the solution under examination and the maximum pressure required for the formation of the bubble is measured. The maximum pressure method has a number of advantages, such as the possibility of developing automatic devices on the basis of the method, examining solutions at high temperatures, and the satisfactory reproducibility of the measurements taken in the identical conditions; the time range of measurement of the dynamic surface tension varies from 0.5 to 500 sec. The method of maximum pressure in the gas bubble is one of the most accurate methods of determining the surface tension. (7 refs.)

108114 Energetics of solid/liquid interfaces of metals and alloys. N.Eustathopoulos (ENSEEG, Domaine Univ., Saint Martin d'Heres, France).
Int. Met. Rev. (GB), vol.28, no.4, p.189-210 (1983).
The methods for determining the solid/liquid interfacial tension in pure metals and alloys are described and a compilation of experimental results is presented. Information is also given on chemical adsorption and on atomic structure of interfaces, as derived from the compositional and orientation dependence of the interfacial tension. Theoretical models for calculating the thermodynamic properties of interfaces are discussed. The influence of solid/liquid interfaces on the properties of metals and alloys is illustrated with typical examples. (121 refs.)

108115 Study of the surface tension of polymer solutions: theory and experiments in theta solvent conditions. J.M.di Meglio, R.Ober, L.Paz, C.Taupin, P.Pincus (Lab. de Phys. de la Matiere Condensee, Coll. de France, Paris, France), S.Boileau.
J. Phys. (France), vol.44, no.9, p.1035-40 (Sept. 1983).
A study of the surface tension of semi-dilute polymer solutions in theta solvent conditions is presented. Theoretical predictions are given for the two cases when the interface is attractive or repulsive. The Cahn approach for the interfacial tension is used in order to calculate the interfacial tension in the mean field theory of polymer solutions. The measurements were performed on two polymer theta solvent systems: polydimethylsiloxane-bromocyclohexane at 29°C and polystyrene-cyclohexane at 34°C for the attractive and repulsive cases respectively. The well-known ring method was used. The agreement between theory and experiments is good. The theoretical predictions and the results are compared with those obtained in good solvent case. The transition θ solvent-good solvent is studied for the attractive system. (35 refs.)

108116 Wetting of nickel by silver. V.K.Nagesh, J.A.Pask (Dept. of Materials Sci. & Mineral Engng., Univ. of California, Berkeley, CA, USA).
J. Mater. Sci. (GB), vol.18, no.9, p.2665-70 (Sept. 1983).
Sessile drop experiments of molten silver and nickel were performed in air and helium at 970°C. A NiO layer formed at the interface in air; silver formed a 90° contact angle. In helium silver formed a 9° contact angle on nickel. The role of solution reactions in forming these angles is discussed. (7 refs.)

108117 The implications of surface energy in ice adhesion. K.Itagaki (Cold Regions Res. & Engng. Lab., Corps. of Engng., Dept. of the Army, Hanover, NH, USA).
J. Adhes. (GB), vol.16, no.1, p.41-8 (1983).
A simple experiment indicates that the effect of the surface energy of a substrate can be detected through a thin grease layer by spreading water drops. The effect of the surface energy on the adhesive strength of ice can be described qualitatively based on this fact with the use of a schematic diagram. The observations reported may shed some light on the mechanism of bond weakening by hydrophobic coating and the contributions of various parameters to the adhesive strength of ice. (2 refs.)

108118 Wall effects in du Nouy ring tensiometry. Theory and experiment. D.N.Furlong (Div. of Appl. Organic Chem., CSIRO, Melbourne, Australia), P.A.Freeman, I.M.Metcalfe, L.R.White.
J. Chem. Soc. Faraday Trans. I (GB), vol.79, pt.8, p.1701-19 (Aug. 1983).
A rigorous theory of wall effects in du Nouy ring tensiometry is developed which is no more difficult to compute than the infinite-wall theory of C. Huh and S.G. Mason (1975). The predictions of the theory are compared with experimental measurements on wetting and non-wetting walls. (22 refs.)

108119 Towards a molecular theory of the solid-liquid phase boundary. Structural theory and effective lattice models. Th.Klupsch (Phys.-Tech. Inst., Akad. der Wissenschaften, Jena, Germany).
Phys. Status Solidi b (Germany), vol.118, no.2, p.681-90 (1 Aug. 1983).
From the molecular, structural theory, an unrestricted quadratic Ising model is derived the subcritical region of which enables a semi-quantitative description of the f.c.c. crystalline phase in coexistence with its melt including the interface between them for simple one-component systems with small melting heat at thermal equilibrium, especially for Lennard-Jones systems near the triple point. The Ising Hamiltonian is determined by the free excess energy and not by the internal energy; except for the melting heat, it involves contributions from the entropy difference connected with the higher degree of disorder of liquids compared with the crystalline state. Therefore, a remarkably large Jackson-Temkin factor of about three results, but it does not uniquely determine the interface structure because the effective interaction is not restricted to next neighbouring lattice sites. A new interpretation of the wetting condition in terms of the effective potential is presented. (19 refs.)

108120 Thermodynamic properties of a hard-sphere fluid near a hard wall at low temperatures. G.Navascues, R.Bragado (Inst. de Fisica del Estado Solido, Consejo Superior de Investigaciones, Cientificas, Univ. Autonoma de Madrid, Madrid, Spain).
Phys. Rev. A (USA), vol.28, no.3, p.1848-51 (Sept. 1983).
The effect of the location of the Gibbs dividing surface on the absorption and the correct definition of the spreading pressure of a hard-sphere fluid near a hard wall are discussed. The first four exact virial coefficients of the spreading pressure have been calculated. They are compared with those obtained with the use of Percus-Yevick, hypernetted-chain, scale-particle-theory, and superposition approximations. The first three coefficients of the adsorption are calculated. A simpler alternate integral equation for the density profile is proposed with the use of the superposition approximation. (9 refs.)

108121 Dependence of interfacial tension of plane isotropic liquid-nematic liquid crystal boundary on elastic constants and phase transition parameters. V.B.Magalinskii, A.N.Mikhailov (P. Lumumba Friendship of Nations Univ., USSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.2, p.239 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.403-4 (March-April 1983). [received: Sept. 1983]
The transition region between an isotropic liquid and a nematic liquid crystal (IL-NLC) is characterized by a very low interfacial tension and a marked discontinuity in the Tsvetkov parameter of the orientation order η. The tensor Maier-Saupe order parameter is equal to $Q_{\alpha\beta}=\eta\rho(N_\alpha N_\beta-\delta_{\alpha\beta}/3)$, where N is the director, ρ is the density. (9 refs.)

108122 Theoretical and experimental investigation on capillary condensation—application of the thermodynamics of finite systems to the consideration of curvature dependence of surface tension. W.Vogelsberger, J.Sonnefeld, G.Rudakoff (Sektion Chem., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Z. Phys. Chem., Leipzig (Germany), vol.264, no.4, p.625-39 (1983). In German.
Application of the thermodynamics of finite systems shows the capillary equilibria to be minima of the Helmholtz free energy of condensation. The equilibrium condition, the well known Kelvin-equation, has to contain a term referring to the change of surface tension with radius of curvature, if a curvature dependent surface tension is used. All tested relations for the curvature dependence of the surface tension shown that the process of emptying takes place at angles of contact larger than zero. From experimental results of numerous partly chemical different porous substances it follows that the use of a curvature dependent surface tension in the model calculations gives a more realistic description of the real pore system than constant surface tension. (19 refs.)

108123 Study of the surface tension minimum of aqueous alcohol solutions and movements at the interface air/solution. G.Petre, M.C.Limbourg-Fontaine, J.C.Legros (Univ. Libre de Bruxelles, Brussels, Belgium).
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.199-200
Aqueous long chain alcohols have a surface tension which presents, at equilibrium, a minimum of surface tension as a function of temperature. It is verified that in an interface air-solution submitted to a temperature difference, $\Delta T=T_1-T_2$, movements are induced from hot to cold region when T_1 and T_2 are below the temperature T_{min} corresponding to that minimum of surface tension and the movements are from cold to hot region when T_1 and T_2 are above T_{min}. (3 refs.)

108124 Almost cylindrical isorotating liquid bridges for small Bond numbers. J.M.Vega, J.M.Perales (ETSI, Aeronauticos, Univ. Politecnica de Madrid, Madrid, Spain).
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.247-52
In the absence of gravity, a cylindrical-shaped liquid bridge becomes unstable as the slenderness of the bridge Λ exceeds a critical value Λ_c, which depends on the rotational Weber number W. The unstable mode is either axisymmetric (amphora-mode) or non-axisymmetric (C-mode) depending on whether W is smaller or bigger than 1/3. Almost cylindrical bifurcating stationary shapes, with a cylindrical volume, are calculated for $|\Lambda-\Lambda_c|\ll 1$. It is seen that the bifurcation is always subcritical, i.e. the bifurcating non-cylindrical shapes appear for $\Lambda<\Lambda_c$. The effect of a small axial gravity, i.e. a small gravitational Bond number B is also considered. It is seen that $\Lambda_c(0,\Lambda)-\Lambda_c(B,\Lambda)$ is of the order of $B^{2/3}$ for amphora modes, and of the order of B^2 for C-modes. Finally, a comparison is made with numerical and experimental results available in the literature, and some comments on the dynamical behaviour of the liquid bridge are given. (11 refs.)

108125 Conservation laws for liquid bridges. I.Da-Riva (Lab. de Aerodinamica, Univ. Politecnica, Madrid, Spain).
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.253-60
Conservation laws for an inviscid liquid bridge set into motion by conservative forces are given in integral form. These laws provide useful information on the overall motion of the bridge in the presence of unexpected or uncontrolled disturbances and could, in addition, be monitored in a computational solution of the problem as an accuracy check. Many of the resulting conservation laws are familiar to fluid dynamicists. Nevertheless, a systematic approach providing an exhaustive list of these laws reveals the existence of new conserved properties hardly deducible in the classical way. Although the present analysis concerns the case of axial and constant gravity it can be applied, with minor refinements, when the gravity field varies with time in both direction and intensity. (7 refs.)

108126 The breaking of axisymmetric non-cylindrical liquid bridges. J.Meseguer, A.Sanz, D.Rivas (Lab. de Aerodinamica, Univ. Politecnica de Madrid, Madrid, Spain).
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.261-5
A numerical study of the dynamic behaviour of axisymmetric inviscid liquid bridges near the stability limit of minimum volume has been made by using a one-dimensional slice model. This model has been already used to study the behaviour of cylindrical bridges both analytically and numerically. Although its validity is questionable regarding short bridges, it seems to be appropriate for sufficiently slender bridges. In this study, the interface evolution of non-cylindrical configurations as well as overall data (such as the breaking time, or partial volume of the resulting drops) which can be easily verified experimentally, have been obtained numerically. (9 refs.)

108127 Stability of axisymmetric liquid bridges. I.Martinez (ETSI Aeronauticos, Univ. Politecnica de Madrid, Madrid, Spain).
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.267-73
A simple formulation and a compact set of graphic data are presented for the equilibrium shapes and stability limits of axisymmetric liquid bridges. The stability analysis is based on the bifurcation of static configurations and gives the minimum liquid volume a bridge can hold, and the breaking mode. The end supports considered are: equal discs, unequal discs, free edge plates and paraboloidal supports. (6 refs.)

68.15 LIQUID THIN FILMS

108128 'Hot' crystallization centers in amorphous layers. V.P.Koverda, V.P.Skripov (Dept. of Physicotech. Problems of Power Generation, Acad. of Sci., USSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.106-8 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.185-7 (Jan.-Feb. 1983). [received: Sept. 1983]
For amorphous layers of water at crystallization temperatures the viscosity is 10^8-10^6. If the dimension of the crystalline center is $R\approx 10^{-3}$-10^{-4} cm, then this center can be called 'hot'. Its existence and rapid growth are due to intensive evolution of heat of crystallization, leading to a reduction in the viscosity around the growing center. Crystallization of amorphous layers of water on cold centers with nonstationary nucleation requires a rise in the temperature of the amorphous layer to 160-170K. In contrast with this process, crystallization at hot centers can start at lower temperatures; it requires only local heating of the amorphous layer, which is necessary for the formation of a single hot crystallization center. (6 refs.)

68.20 SOLID SURFACE STRUCTURE

108129 The characterization of the surfaces of tungsten-based dispenser cathodes. C.R.K.Marrian, A.Shih, G.A.Haas (Naval Res. Lab., Washington, DC, USA).
Appl. Surf. Sci. (Netherlands), vol.16, no.1-2, p.1-24 (May-June 1983). (3rd Tri-Service Cathode Workshop, Fort Monmouth, NJ, USA, 23-26 March 1982).
The 'CD', 'M' and scandate cathodes all have a better thermionic emission performance than the 'B' type of impregnated tungsten based dispenser cathode. Modern surface analysis techniques (AES, ISS, SIMS and SLEEP) have been used to examine the surfaces of the four cathode types. The cathode surfaces have been studied in their active state, during reactivation following a sputter cleaning of their surfaces and whilst poisoned by, and reactivating from, an exposure to 10 L O_2. The results are discussed in terms of surface models which would be consistent with the observed data. The

differences in the surfaces of the different cathode types are examined and the value of the various surface analysis techniques discussed. (15 refs.)

108130 Surface study of a Ag electrode on a solid electrolyte used as oxygen sensor. T.Arakawa, A.Saito, J.Shiokawa (Dept. of Appl. Chem., Osaka Univ., Osaka-fu, Japan).
Appl. Surf. Sci. (Netherlands), vol.16, no.3-4, p.365-72 (July-Aug. 1983).
The Ag electrode surface of a solid electrolyte has been studied by X-ray photoelectron spectroscopy and a scanning electron microscope. The XPS has performed in situ observation of the Ag electrode surface when DC current was passed through a system of $P(O_2)$, Ag|ZrO_2-CaO|Ag, $P(O'_2)$. The nature of the Ag-O system on the electrode is dependent on the temperature. It has been observed by XPS that there are three types of Ag-O system at 400°C. Type I with O 1s binding energy of 532.6 eV only appeared at 325°C. Moreover, when the temperature was raised to 400°C, Types II and III (with BEs 531.1 and 529.2 eV) appeared. And a fourth state at ca. 530.1 eV also existed. Type I is the type where the mixing of the 2p orbitals with the d-band of the Ag metal is not so strong. Type II is assigned as a diatomic oxygen-silver complex, i.e. Ag^+-O_2^-. Type III is considered to represent oxygen atoms in an oxide-like layer. However, the O 1s signal disappeared switching off the DC current in both cases. A scanning electron microscope study of the electrode texture helped to understand the change of O 1s signal. (16 refs.)

108131 The surface composition of Pt-Cu alloys: experimental observations and theory of surface segregation. A.D.van Langeveld, V.Ponec (Gorlaeus Labs., State Univ. of Leiden, Leiden, Netherlands).
Appl. Surf. Sci. (Netherlands), vol.16, no.3-4, p.405-23 (July-Aug. 1983).
The surface composition of a number of Pt-Cu alloys varying in their bulk composition from approximately 40 up to 80 at.% Pt has been studied by Auger Electron Spectroscopy. The samples, equilibrated in ultrahigh vacuum at 970K, showed a moderate segregation of Cu to the surface. For the analysis of the Auger spectra the Gallon model (1969) was used. According to this model a layer-by-layer contribution to the intensity of the measured Auger signal was accounted for. The experimental data are rationalized by a two-layer regular solution model, which takes into account the difference in the atomic radii. (39 refs.)

108132 A TEM study of activated FeTi surface. A.Venkert, M.Talianker, M.P.Dariel (Dept. of Materials Engng., Ben-Gurion Univ., Beer Sheva, Israel).
Mater. Lett. (Netherlands), vol.2, no.1, p.45-8 (July 1983).
Transmission electron microscopy was used to study FeTi samples that had undergone activation treatments at low oxygen pressure. Activation treatments resulted in the formation of oxygen-stabilised $Ti_4Fe_2O_x$ precipitates in the surface layers. In addition at 0.1 Pa oxygen pressure TiO is formed, while TiO_2 and Fe_3O_4 are formed both at low and high oxygen pressure treatments. (14 refs.)

108133 Study of high order reconstructions of the Si (100) surface. J.Ihm (Bell Labs., Murray Hill, NJ, USA), D.H.Lee, J.D.Joannopoulos, A.N.Berker.
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.705-8 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
The structure of the reconstructed Si (100) surface is studied using the tight-binding energy minimization method combined with a renormalization-group calculation. (2×1), $c(2\times2)$, $p(2\times2)$, (4×1), $c(4\times2)$, and $p(4\times2)$ structures are studied and compared. They are classified into two groups which are separated by a large activation barrier. In one group, (2×1), $p(2\times2)$, and $c(4\times2)$ structures are almost degenerate in energy, which can result in diffuse (2×1) LEED patterns. In the other group, a second-order phase transition can occur from the $c(2\times2)$ to the disordered structure at ~800K. Domains of different structures may coexist on the actual surface. (31 refs.)

108134 Structural chemistry of the cleavage faces of compound semiconductors. C.B.Duke (Xerox Webster Res. Center, Webster, NY, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.732-5 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
The major features of the reconstructed atomic geometries of the (110) surfaces of zincblende structure compound semiconductors are characterized by two parameters: the relative displacement perpendicular to the surface of the anions and cations in the outermost layer $\Delta_{1,\perp}$ and the angle ω_1 between the plane determined by the chains of these species in the reconstructed surface and the truncated bulk surface. Analysis of the surface structures of nine compound semiconductors reveals a linear correlation between $\Delta_{1,\perp}$ and the bulk cubic lattice constant a_0. A linear correlation between ω_1 and a_0 also is suggested, but is less firmly established. If the sum of either the Pauling covalent radii or the nonlocal pseudopotential core radii are substituted in place of a_0 comparable correlations are achieved. The structures of two previously unexamined surfaces, InAs (110) and AlP (110), are shown to be predicted correctly by these correlations. (30 refs.)

108135 The role of impurity atoms in the formation of defect structure on quartz surfaces under the action of an electrostatic field. S.H.Adamyan, P.A.Bezirganyan.
Izv. Akad. Nauk Arm. SSR Fiz. (USSR), vol.17, no.1, p.26-30 (1982). In Russian.
It has been shown by means of X-radiography that the role played by impurity atoms in the change of a defect structure under the action of an electrostatic field is large. During the piezodeformation of a specimen charged layers are formed near the surface that distort reflecting plates and strongly influence the intensity of scattered X-rays. (6 refs.)

108136 Surface morphologies of magnesium vanadium oxide, $Mg_{2-x}V_{1+x}O_4$. H.Oshima (Nat. Inst. for Res. in Inorganic Materials, Ibaraki, Japan).
J. Am. Ceram. Soc. (USA), vol.66, no.7, p.482-5 (July 1983).
The microscopic appearance of the particle surfaces of magnesium vanadium oxide, $Mg_{2-x}V_{1+x}O_4$, loose powders prepared in various atmospheres at 1200°C was studied. The surface morphology, observed by SEM, was dependent on the V^{4+} content, and three typical features were distinguished at the following x values: $0.75 \lesssim x < 1.00$; rounded crystals with smooth surfaces; $0.55 \lesssim x \lesssim 0.75$; edged crystals with stepped surfaces; $x \lesssim 0.55$; coarse crystals with rough surfaces. (7 refs.)

108137 Structure analysis of the Si(111)7×7 surface by low-energy ion scattering. M.Aono, R.Souda, C.Oshima, Y.Ishizawa (Nat. Inst. for Res. in Inorganic Materials, Ibaraki, Japan).
Phys. Rev. Lett. (USA), vol.51, no.9, p.801-4 (29 Aug. 1983).
A new structural model for the Si(111)7×7 surface called the pyramidal cluster model is proposed on the basis of specialized low-energy ion-scattering experiments. (23 refs.)

108138 Femtosecond-time-resolved surface structural dynamics of optically excited silicon. C.V.Shank, R.Yen, C.Hirlimann (Bell Telephone Labs., Holmdel, NJ, USA).
Phys. Rev. Lett. (USA), vol.51, no.10, p.900-2 (5 Sept. 1983).
The dynamics of the structural changes that take place on a silicon surface following excitation with an intense optical pulse are observed with 90-fs time resolution. The threefold rotational symmetry of the silicon ⟨111⟩ surface becomes rotationally isotropic within a picosecond after excitation consistent with a transition from the crystalline to the liquid molten state. (14 refs.)

108139 Direct imaging of carbon-covered and clean gold (110) surfaces. L.D.Marks (Cavendish Lab., Univ. of Cambridge, Cambridge, England).
Phys. Rev. Lett. (USA), vol.51, no.11, p.1000-2 (12 Sept. 1983).
Results are presented on the atomic structure of gold (110) surfaces obtained by high-resolution electron microscopy. When covered by carbon, the 1×1 surface without surface relaxations is stable. Without carbon, a rough 2×1 reconstruction occurs with the missing-row structure, a 20%±5% outer-atom expansion and a 10% occupancy of atoms displaced outwards by 40%±20% down the channels. Local regions of 1×1 surface also exhibit a 10%±5% expansion of the outermost atoms. (8 refs.)

108140 Study of surface composition of iron-based metallic glasses by means of UV photoemission, angle resolved Auger electron and ion scattering spectroscopy. T.Berghaus, H.Neddermeyer, W.Radlik, V.Rogge (Inst. fur Experimentalphys., Ruhr-Univ., Bochum, Germany).
Phys. Scr. (Sweden), vol.T4, p.194-6 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).
Two different attempts have been made to obtain information on surface concentration, concentration gradients, segregation effects and surface contamination of metallic glasses. (i) Angle-resolved Auger electron spectroscopy and variation of the observation angle was applied to $Fe_{81.5}B_{14.5}Si_4$ and (ii) ion scattering spectroscopy in combination with normal emission UV photoelectron and Auger electron spectroscopy to $Fe_{75}B_{25}$. (8 refs.)

108141 Atomic structure of Si{001}2×1. W.S.Yang, F.Jona (Dept. of Materials Sci. & Engng., State Univ. of New York, Stony Brook, NY, USA), P.M.Marcus.
Phys. Rev. B (USA), vol.28, no.4, p.2049-59 (15 Aug. 1983).
New experiments on reconstructed Si{001}2×1 and their analysis by low-energy electron diffraction (LEED) are reported. A new structural model containing asymmetric and buckled dimers and strains extending to three and four atomic layers is presented, which fits the LEED data substantially better than any other model tested. The new structure involves a dimer length of 2.54 Å, an average contraction of first-layer spacing of 8%, and three asymmetric displacements of the dimer atoms. A detailed discussion of the needed intensity-averaging procedures among eight equivalent domains is presented. Two theoretical structural models for Si{001}2×1 developed by others on the basis of minimization of total energy are shown to fail the LEED test. (29 refs.)

108142 Surface stacking sequence and (7×7) reconstruction at Si(111) surfaces. E.G.McRae (Bell Labs., Murray Hill, NJ, USA).
Phys. Rev. B (USA), vol.28, no.4, p.2305-7 (15 Aug. 1983).
The (7×7) surface is considered to have a triangular checkerboard structure in which the layer stacking sequences *...AaBbA* and *...AaCcA* alternate in neighboring triangular subunits in conformity with ion-backscattering results. The topological requirements of joining double layers at the subunit boundaries lead to the prediction of arrays of dimers and of deep (6.3-Å) holes which are consistent with results of electron diffraction of tunneling microscopy, respectively. (18 refs.)

108143 Is the (110) face of tungsten reconstructed?. J.P.Bourdin (Inst. Univ. de Technol., Univ. d'Angers, Angers, France), G.Treglia, M.C.Desjonqueres, J.P.Ganachaud, D.Spanjaard.
Solid State Commun. (USA), vol.47, no.4, p.279-82 (July 1983).
LEED and photoemission experiments have suggested that the (110) face of W may present a lateral reconstruction in which all atoms of the surface occupy three-fold coordinated sites. The authors present here a theoretical calculation in which the energy is minimized with respect to vertical and lateral displacements. The role played by electronic correlations is discussed. The unreconstructed and unrelaxed surface is found to be the most stable. (12 refs.)

108144 XPS and AES quantitative surface analysis: comparison on oxide powder systems. F.Garbassi (Istituto Guido Donegani SpA, Novara, Italy).
Surf. & Interface Anal. (GB), vol.5, no.4, p.139-46 (Aug. 1983). (International Conference on Quantitative Surface Analysis, Teddington, England, 24-25 Nov. 1981).
XPS and AES quantitative surface analyses on several oxide systems, containing two or three metal elements, are compared. Both single-phase and multi-phase systems have been investigated, representative of a variety of situations regarding surface vs. bulk composition relationships. Metal-to-metal ratios obtained via the two techniques have been compared. A very intimate intermixing of cations, as it happens in single-phase systems (i.e. solid solutions), appears a necessary but not sufficient condition for obtaining good correlation between the results of the two spectroscopies. Slopes of the straight lines correlating XPS and AES data are generally far from the expected value of 1, suggesting the existence of strong matrix effects for at least one of the two techniques. (29 refs.)

108145 On the phase transition between the (7×7) and (1×1) structures of silicon (111) surfaces studied by reflection electron microscopy. Y.Tanishiro, K.Takayanagi, K.Yagi (Phys. Dept., Tokyo Inst. of Technol., Tokyo, Japan).
Ultramicroscopy (Netherlands), vol.11, no.2-3, p.95-102 (1983). (Surface Imaging and Analysis with High Spatial Resolution, Wickenburg Inn, AZ, USA, 12-15 Jan. 1983).
The phase transition process between the (7×7) and (1×1) structures of the clean silicon (111) surface has been studied by means of reflection electron microscopy (REM). The first-order phase transition was suggested from the observation of preferential nucleation of the new phases along the steps for the ⟨110⟩ electron incidence. Movements of the phase boundaries on the terraces during the transition and their terrace-width-dependence were studied. Changes of the step shape and a sudden stop of the shape fluctuation during the transition on cooling are found to be due to the formation of out-of-phase boundaries in the (7×7) structure. Image contrast in REM observations of the $\langle 11\bar{2}\rangle$ incidence suggests the second-order type of phase transition. On the basis of these observations the phase transition process is discussed. Electron energy loss spectroscopic study of the phase transition is also reported. (17 refs.)

108146 Analysis of surface structural defects using LEED and RHEED. M.G.Lagally (Dept. of Metall. & Mineral Engng., Univ. of Wisconsin, Madison, WI, USA).
Ultramicroscopy (Netherlands), vol.11, no.2-3, p.103-4 (1983). (Surface Imaging and Analysis with High Spatial Resolution, Wickenburg Inn, AZ, USA, 12-15 Jan. 1983).
Diffraction techniques that are sensitive to the surface can, in principle, be used to study the surface structural defects. Low-energy electron diffraction (LEED) and reflection high-energy electron diffraction (RHEED) are two techniques that can be used in this way. By measuring the angular distribution of intensity of diffracted beams, different types of surface effects can be distinguished and quantified. Recent progress in the use of LEED to analyze steps, finite-size overlayer domains, surface strain, and mosaic effects is reviewed. In particular, overlayer studies present challenging and interesting problems, because they can involve the combination of finite-size effects in the oberlayer with the scattering from a coherent substrate. Examples of defect analysis on several surfaces are given. Recently renewed interest has been shown in the use of RHEED for surface defect studies. The capabilities for defect studies of conventional RHEED, as found in crystal surface studies or epitaxial growth experiments, are described and compared to those of LEED. (26 refs.)

108147 Surface studies with (clean) supported metal particles and clusters. H.R.Poppa (Dept. of Materials Sci., Stanford Univ., Stanford, CA, USA).
Ultramicroscopy (Netherlands), vol.11, no.2-3, p.105-16 (1983). (Surface Imaging and Analysis with High Spatial Resolution, Wickenburg Inn, AZ, USA, 12-15 Jan. 1983).
Small particles are ideal for combined studies with surface analytical and electron microscopy/diffraction methods. In this way crystallography, microstructure, morphology, physical stability, and electronic structure can be correlated directly with chemical reactivity. Various integrated experimental approaches for conducting model studies with UHV-evaporated particles have been successfully developed; they entail the use of TPD, AES, XPS, and work function measurements on one hand and standard TEM/TED, in-situ TEM/TED, and in-situ STED/TEM techniques on the other hand. The essential features of four particular experimental approaches are discussed and a selection of representative results is presented to illustrate the potential usefulness of such studies in the field of catalysis. (39 refs.)

108148 High energy transmission electron diffraction and imaging studies of the silicon (111) 7×7 surface structure. J.C.H.Spence (Dept. of Phys., Arizona State Univ., Tempe, AZ, USA).
Ultramicroscopy (Netherlands), vol.11, no.2-3, p.117-24 (1983). (Surface Imaging and Analysis with High Spatial Resolution, Wickenburg Inn, AZ, USA, 12-15 Jan. 1983).
Kilovolt electron scattering experiments in the transmission geometry offer certain advantages for surface structure analysis over more traditional techniques. These include the absence of electron exchange effects, the ability to analyze submicron regions, their compatibility with imaging (for the study of chemically important inhomogeneities) and the usefulness of the kinematic approximation for surface superlattice reflections. An experimental 100 kV transmission electron diffraction pattern from the silicon [111] 7×7 structure is analyzed and compared with the diffracted intensities expected from two recent models for the 7×7 adlayer. Shuffle and glide termination effects are discussed. Thousand-beam dynamical calculations of atomic resolution transmission electron images of the surface superlattice are used to show the high sensitivity of these to charge transfer effects, and the imaging conditions needed to maximize this sensitivity are determined. (19 refs.)

108149 STEM imaging and analysis of surfaces. J.M.Cowley, Z.-C.Kang (Dept. of Phys., Arizona State Univ., Tempe, AZ, USA).
Ultramicroscopy (Netherlands), vol.11, no.2-3, p.131-40 (1983). (Surface Imaging and Analysis with High Spatial Resolution, Wickenburg Inn, AZ, USA, 12-15 Jan. 1983).
Scanning reflection electron microscopy (SREM) can provide various types of image contrast depending on the smoothness and crystallinity of the surface. For flat single surfaces SREM gives the same range of phase contrast and diffraction contrast effects as in REM but suffer to some extent from limited depth of focus and noisy images. As with STEM, the main advantage of SREM arises from the possibility of obtaining microdiffraction patterns and some microanalysis from any small region of the image. Applications to the study of surface reactions include the investigation of the reaction of thin evaporated gold layers with magnesium oxide smoke crystals. The gold is initially in the form of very small crystals but reacts with the MgO when heated in vacuum at more than 500°C forming a series of compounds in thin films or small crystallites on the MgO surface. Microdiffraction patterns from surface layers of crystals may be affected by surface refraction effects or by surface channelling phenomena but in the current case are attributed to the presence of one or two atomic layers of a reaction product. (22 refs.)

108150 Reflection electron microscopy (REM) of vicinal surfaces of FCC metals. Tung Hsu (Dept. of Phys., Arizona State Univ., Tempe, AZ, US).
Ultramicroscopy (Netherlands), vol.11, no.2-3, p.167-72 (1983). (Surface Imaging and Analysis with High Spatial Resolution, Wickenburg Inn, AZ, USA, 12-15 Jan. 1983).
REM has been applied to study the low index facets and their vicinal regions on Au and Pt spheres solidified from the melt. Areas of regularly spaced steps have caused splitting of diffraction spots, and the splitting in the diffraction pattern agrees with the periodicity of steps as measured in the REM image. Resolution limits for REM images are discussed and compared to the 9 Å resolution experimentally achieved. (13 refs.)

68.30 DYNAMICS OF SOLID SURFACES AND INTERFACE VIBRATIONS

108151 Thermal boundary resistance at the interface between a crystal and a disordered solid. J.Jackle (Fakultat fur Phys., Univ. Konstanz, Konstanz, Germany).
Z. Phys. B (Germany), vol.52, no.2, p.133-7 (1983).
The thermal boundary resistance at the interface between a crystalline and disordered solid with large scattering mismatch but negligible acoustic mismatch is calculated. Under the assumption that phonon scattering in the disordered material is predominantly elastic and strongly frequency dependent, the thermal boundary resistance derives from the spectral redistribution of the heat current by inelastic processes in the vicinity of the interface. (13 refs.)

108152 Measurement of the Rayleigh surface-phonon dispersion curve for NaCl(001) from high-resolution He time-of-flight spectroscopy and from kinematical focusing angles. G.Benedek, G.Brusdeylins, R.Bruce Doak, J.G.Skofronick, J.P.Toennies (Max-Planck-Inst. fur Stromungsforschung, Gottingen, Germany).
Phys. Rev. B (USA), vol.28, no.4, p.2104-13 (15 Aug. 1983).
Angular distributions and time-of-flight spectra have been measured for the collisions of 20-meV He atoms with a NaCl(001) surface in the ⟨100⟩ direction. Structures in the angular distribution and in the time-of-flight spectra due to elastic and inelastic scattering are measured and used to extract (1) a corrugation parameter of the rigid-atom surface potential $\zeta_0=0.34$ Å, (2) three bound-state energies of the He-surface potential, and (3) a surface-phonon Rayleigh dispersion curve out to the edge of the Brillouin zone. Furthermore, the authors were able to demonstrate that by rotating the crystal about the surface normal it is possible to unambiguously identify kinematical focusing features in the angular distributions. These features were then used to determine a surface-phonon dispersion curve in good agreement with that obtained from the time-of-flight experiments. (35 refs.)

68.45 SOLID-FLUID INTERFACE PROCESSES

(see also 82.65 Sorption and accommodation coefficients)

108153 Absorption of carbon from residual gases during Ti implantation of alloys. I.L.Singer (Chem. Div., Naval Res. Lab., Washington, DC, USA).
Appl. Phys. Lett. (USA), vol.43, no.5, p.457-9 (1 Sept. 1983).
Secondary ion mass spectrometry (SIMS) has been used to analyze the surface composition of several steel and Ni-plated substrates implanted with Ti ions (5×10^{17} Ti/cm^2 at 190 keV). SIMS shows clearly the carbonaceous subsurface layer previously reported in Auger and nuclear backscattering analyses of Ti-implanted Fe-based alloys. Moreover, substrates implanted in a vacuum which was backfilled with isotopic ^{13}CO gas showed 20 to 50× higher mass 13/mass 12 ratios for surface concentrations and integrated subsurface doses than substrates implanted in normal vacuum atmospheres at pressures near 10^{-6} Torr. Auger analysis confirmed the subsurface C profile and found no O(<1 at.%) below the oxide layer. The experiments provide direct evidence that C atoms can be absorbed from residual gas molecules in a vacuum chamber near room temperatures during implantation of carbide-forming ions. A second possible source of C atoms is also discussed. (8 refs.)

108154 The effect of metal composition on the adsorption of zinc di-isopropyldithiophosphate. B.Dacre, C.H.Bovington (Royal Military Coll. of Sci., Shrivenham, England).
ASLE Trans. (USA), vol.26, no.3, p.333-43 (July 1983).
Rates of adsorption of zinc di-isopropyldithiophosphate from n-hexadecane on to iron and steel (13 percent Cr) disks have been measured using ^{65}Zn and ^{14}C radiolabelling. Concentration, stirring, and temperature dependence have been examined. A selective rinsing technique has been used to investigate chemisorption which occurs extensively on iron but not at all on the steel. On iron, adsorption occurs with some release of zinc at all temperatures investigated. On the steel, no zinc is lost from the adsorbed layer. Absence of stirring effects indicates that rates are surface rather than diffusion controlled. Results have been compared with those of previous workers. (11 refs.)

108155 A Lennard-Jones calculation of Xe adsorption on reconstructed Ir(100) and Pt(100) surfaces. J.Kuppers, U.Seip (Inst. fur Phys. Chem., Univ. Munchen, Munchen, Germany).
Appl. Surf. Sci. (Netherlands), vol.16, no.3-4, p.313-21 (July-Aug. 1983).
Xenon adsorption energy profiles have been calculated for various reconstructed overlayers at Ir(100) and Pt(110) surfaces on the basis of a Lennard-Jones 6-12 pair potential operating between adsorbed Xe and the surface metal atoms. Agreement with experimental data is observed with a buckled hexagonal overlayer at Ir(100) and a missing row structure at Pt(110). (7 refs.)

108156 Study of kinetic adsorption of H_2S, at very low pressure on face (110) of copper. Phu Sy Uy, J.Bardolle, M.Bujor (Univ. d'Orleans, Orleans, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.20, p.1571-4 (6 June 1983). In French.
Very low pressure adsorption of H_2S on the clean and oxygen covered Cu (110) face has been followed by Auger electron spectroscopy and surface potential variation measurements. (6 refs.)

108157 Partial phase diagram of the two-dimensional Ni(111)-S system from LEED and Auger electron spectroscopy. R.Ramanathan, J.M.Blakely (Dept. of Materials Sci. & Engng., Cornell Univ., Ithaca, NY, USA).
Mater. Lett. (Netherlands), vol.2, no.1, p.12-19 (July 1983).
Using low-energy electron diffraction (LEED) and Auger electron spectroscopy (AES) the ordered phases in the two-dimensional Ni(111)-S system have been examined. The results are presented in terms of a 'temperature versus coverage' phase diagram. At relatively low coverages a well-ordered Ni(111) p(2×2)S structure was observed. This undergoes a reversible transformation as temperature is cycled. In an intermediate narrow coverage range, a two-phase structure was observed for the first time in this system. This structure consists of Ni(111) p(2×2)S and a complex structure similar to the one reported by other investigators. The temperatures of these reversible structural transformations were determined. At high coverages only a complex LEED pattern was observed. The structure producing this pattern undergoes a reversible transformation at high temperatures (i.e. $\gtrsim$570K). (25 refs.)

108158 Theory of sorption of gases on polymers. II. Effects of inter-chain secondary bonds. M.Pyda (Inst. of Phys. & Chem., Acad. of Agriculture, Poznan, Poland), M.Kurzynski.
Chem. Phys. (Netherlands), vol.79, no.2, p.219-24 (1 Sept. 1983).
For pt.I see ibid., vol. 67, p.7 (1982). A simple phenomenological model of the influence of sorption on the subsystem of secondary bonds of a polymer is proposed. Two mechanisms are considered: the competition between creation of sorbate-sorbent bonds and inter-chain bonds, and the dependence of the volume accessible for condensation of sorbate molecules on the number of secondary bonds. The model is analyzed numerically and the effects of plasticization and swelling are discussed. An alternative interpretation of the double-sigmoid sorption isotherms of higher alcohol vapours on cellulose is proposed. (3 refs.)

108159 Bonding geometries of Cl on Si{111} and Ge{111}. G.B.Bachelet, M.Schluter (Bell Labs., Murray Hill, NJ, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.726-8 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Determines the chemisorption geometry of Cl-Si{111} and Cl-Ge{111} by total energy minimization. The calculations are done within the local-density-functional framework using normconserving pseudopotentials. Among the three bonding sites investigated, Cl is found to be most stable in the onefold atop position on both Si{100} and Ge{111}. The calculations confirm the site geometries obtained in recent surface extended X-ray absorption fine structure (SEXAFS) measurements on annealed surfaces. The calculated substrate-Cl bond lengths are in quantitative agreement with the SEXAFS results. The authors also predict vibrational frequencies for the Cl-substrate modes which, because of the highly ionic character of the bond, should be easily observable by infrared or energy loss spectroscopy. (17 refs.)

108160 Sb and Al chemisorption on GaAs(110). Zhang Kai-Ming, Xu Yong-Nian (Modern Phys. Inst., Fudan Univ., Shanghai, China).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.729-31 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
In the present paper the chemisorption of Al and Sb on the GaAs(110) surface is studied theoretically. In the case of higher coverage, the authors designed a cluster model with Al_4 sitting upon the GaAs(110) surface. The computer renormalization technique is used, and some pseudo-*s*-orbitals are adopted to fit the molecular orbitals of cluster Al_4 by the least square method. The charge self-consistent extended Huckel method is used with a cluster model simulating the substrate GaAs(110). The calculated results show that differences do exist between column III and V elements on GaAs(110). The covalent character for the Sb-GaAs bond is quite obvious, whereas the Al overlayer cluster interacts only weakly with the substrate, so that covalent bonds can be formed only in the case of lower coverage. (19 refs.)

108161 Oxygen and hydrogen adsorption on GaAs (110). F.Bartels, L.Surkamp, H.J.Clemens, W.Monch (Lab. fur Festkorperphys., Univ. Duisburg, Duisburg, Germany).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.756-62 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
The interaction of molecular, 'unexcited' oxygen and of atomic hydrogen with clean, cleaved GaAs surfaces was studied by Auger-electron and low-energy electron energy-loss spectroscopy as well as by a Kelvin probe. Up to $\approx 3\times10^5$ L of O_2 the coverage slightly increases only up to $\theta=0.05$-0.1, depending on the 'quality' of the cleave. This chemisorption, which is attributed to cleavage-induced imperfections, is further correlated with the annihilation of the 20 eV energy-loss, usually characterized as an excitonic Ga(3*d*) core level-to-dangling bond states transition. The main chemisorption is observed after exposures above 3×10^5 L and yields $\theta=0.8$ after 10^{10} L of O_2. Two successive stages can be distinguished. The first one saturates at $\theta=0.4$-0.5 after 3×10^6 L of O_2. Larger exposures further increase the coverage and cause two new losses to grow, an O(2*p*) related one at 7 eV and an As(3*d*) related one shifted by 2.5 eV to larger binding energies. Illumination of the surface with the light of a Xe-arc lamp dramatically stimulated the oxygen uptake. Under the present experimental conditions, the initial sticking coefficient at *RT* is increased by a factor of 100, and the coverage reaches $\theta=1.5$ after 10^{10} L of O_2. The chemisorption of hydrogen causes the work function to increase on *n*-type and to decrease on *p*-type substrates, by this indicating the formation of depletion layers on both substrates. After exposures of up to 5 L the chemisorption-induced surface states of acceptor- and donor-type, respectively, pin the Fermi level at approximately $E_{vs}+0.85$ eV and $E_{vs}+0.63$ eV for *n*- and *p*-doped samples, respectively. Above exposures of 3 L the 20 eV energy-loss peak is observed to decay, and it has vanished after 3×10^4 L of hydrogen. This result clearly demonstrates that hydrogen atoms do not initially bond to the surface Ga atoms. In the exposure range from 50 to 3×10^4 L the intensity ratio of the surface sensitive As(31 eV) and Ga(55 eV) AES peaks decreases by approximately 20% while the Ga(55 eV) signal itself remains unchanged with respect to the primary peak. This result corresponds to a chemisorption-induced loss of approximately 75% of the As atoms in the topmost layer. (49 refs.)

108162 UV photoemission study of low temperature oxygen adsorption on GaAs(110). D.J.Frankel, J.R.Anderson, G.J.Lapeyre (Dept. of Phys., Montana State Univ., Bozeman, MT, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.763-6 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
The adsorption of oxygen on the (110) cleaved surface of GaAs is studied by first physisorbing molecular O_2 on the surface at a temperature of approximately 45K and then warming the surface to 300K. The transformation from a state with molecular O_2 physisorbed on the surface to one with chemisorbed atomic oxygen is studied with ultraviolet photoemission spectroscopy (UPS) using a helium resonance lamp as a source. The physisorbed state shows a set of emission peaks with spacings equal to the gas phase values. The sample temperature is not cold enough to obtain multiple layers of condensed oxygen. As the temperature of the sample is then increased from $T=45$ to 300K, the UPS spectrum changes dramatically; by $T=60$K the molecular O_2 peaks have disappeared and by 170K the spectra have taken on a form characteristic of chemisorbed atomic oxygen. Evidence is found for one or more intermediate states during the transformation of the physisorbed molecular O_2 to chemisorbed atomic oxygen. (16 refs.)

108163 Enhanced oxygen adsorption on palladium silicide at room temperature. R.Butz, H.Wagner (Inst. fur Grenzflachenforschung und Vakuumphys., KFA Julich, Julich, Germany).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.816-18 (July-Sept. 1983).
Following Pd deposition on Si(111), Pd_2Si formation was observed at room temperature up to a Pd coverage of about 10 Å. Exposure to oxygen revealed an estimated four times larger oxygen uptake on the thin Pd_2Si layers with respect to pure Si. Thicker Pd_2Si layers formed upon heating of unreacted Pd layers showed the same enhanced oxygen adsorption. The Si(*LVV*) Auger line shape does not indicate SiO_2 formation but rather maintains the form characteristic for Pd_2Si. (10 refs.)

108164 Specimens in the MnO-Fe_2O_3-H_2O system. M.M.Kosyakina, N.G.Roslyakova, S.I.Kol'tsov (Lensovet Leningrad Technol. Inst., Leningrad, USSR).
Inorg. Mater. (USA), vol.18, no.8, p.1112-15 (Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.8, p.1316-19 (Aug. 1982).
The interaction of ferrogel and divalent manganese salt solutions is studied. Chemisorption of divalent manganese ions by the ferrogel at room temperature results in the formation of highly porous manganese hydroferrites. The

nature of the solid substances obtained was established by thermographic analysis, X-ray diffraction, and IR spectroscopy. (6 refs.)

108165 Adsorption and electrophysical properties of doped gallium arsenide. I.A.Kirovskaya, N.N.Belousova, G.M.Zeleva (Omsk Polytech. Inst., Omsk, USSR).
Inorg. Mater. (USA), vol.18, no.8, p.1174-6 (Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.8, p.1383-4 (Aug. 1982).
The effect of group VI elements as doping agents on the adsorption and electrophysical properties of GaAs was demonstrated. The experimental installation included a vacuum block (with piezoelectric crystal weights) and an electrophysical block, permitting simultaneous measurement of adsorption, surface conductivity σ_s, and contact potential difference on single-crystal specimens of gallium arsenide. These specimens consisted of epitaxial films with and without S, Se, and Te doping, which were grown by a gas-transport method on a germanium substrate with subsequent etching and were coated on the piezoelectric crystal. The adsorbates were hydrogen and oxygen. The temperature interval was 300 to 423K. (7 refs.)

108166 Properties of real surfaces of thin films of cadmium selenide. V.A.Smyntyna (I.I. Mechnikov Odessa State Univ., Odessa, Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.9, p.1263-6 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1479-82 (Sept. 1982). [received: Sept. 1983]
Two types of basic active center are observed on the surfaces of cadmium selenide films—selenium vacancies and excess cadmium atoms. The adsorptive power of the samples at 473K is determined only by the type and concentration of the surface adsorption centers. At room temperature the absorptive power depends on the concentration of free electrons in the bulk of the crystallites and on the height of the potential barrier on their surfaces. In both cases the basic form of oxygen chemisorption is governed by the nature of the basic absorption center. (6 refs.)

108167 Interaction of saturated hydrocarbons with transition-metal films: molecular orbital calculations. R.C.Baetzold (Res. Labs., Eastman Kodak Co., Rochester, NY, USA).
J. Am. Chem. Soc. (USA), vol.105, no.13, p.4271-6 (29 June 1983).
Tight-binding-type calculations have been performed to treat the chemisorption and the C-H bond activation of saturated hydrocarbons (CH_4 and C_2H_6) on transition-metal films. The films contain two to five layers of metal atoms, each with a valence s, p, d component of orbitals. A metal-hydrogen-carbon attractive interaction exists, as manifested by a partial population of the $\sigma^*_{C\text{-}H}$ antibonding hydrocarbon molecular orbitals providing an acceptor function for the molecule. This effect is characterized by a small net electron transfer to hydrocarbon and a decrease in the C-H overlap population. The chemisorption energy of a given hydrocarbon, CH_4 or C_2H_6, decreases as the d occupation of the metal film increases in traversing a periodic row from left to right. This effect may be traced to the fact that the separation between $\sigma^*_{C\text{-}H}$ energy levels of hydrocarbon and metal film Fermi energy increases with increasing d occupation. (27 refs.)

108168 The influence of adsorbate interactions of kinetics and equilibrium CO on Ru (001). I. Adsorption kinetics. H.Pfnur, D.Menzel (Dept. of Phys., Tech. Univ. Munchen, Munchen, Germany).
J. Chem. Phys. (USA), vol.79, no.5, p.2400-10 (1 Sept. 1983).
After careful calibration, the work function change induced by CO adsorption on Ru(001) has been used to measure the sticking coefficient s as functions of sample temperature (between 100 and 400K) and coverage with the gas temperature always at about 295K. The main results are: At $\theta=0$, the sticking coefficient is independent of sample temperature between 100 and 400K, at $s_0=0.7$ for $0<\theta<0.2$. s drops proportional to $(1\text{-}\theta)$ for $T_s>200K$, and more gradually below 200K; at 100K, s drops slowly up to $\theta=0.5$. Above $\theta=0.23$ a sharp decrease of s sets in for $T_s>120K$; a second plateau becomes obvious around $\theta \sim 0.35$ for $T_s<360K$. Close to saturation, s drops to below 10^{-2}. These results are discussed in terms of a percursor model with strong effects of the chemisorbed layer on the properties of the precursor. A critical evaluation of the formal precursor states involved suggests that classical precursor states exist only at appreciable coverage and are defined by the lateral and vertical interactions, while at low coverage the collisional dynamics are determined for sticking of molecules. (25 refs.)

108169 A one-dimensional model for phonon-induced desorption. S.Efrima (Dept. of Chem., Ben Gurion Univ. of Negev, Beer Sheva, Israel), C.Jedrzejek, K.F.Freed, E.Hood, H.Metiu.
J. Chem. Phys. (USA), vol.79, no.5, p.2436-53 (1 Sept. 1983).
The authors derive the kinetic equations for a one-dimensional model of phonon-induced desorption. They start with a generalized master equation and discuss approximations that reduce it to a master equation of the Pauli type. This describes desorption as a stochastic process in which the energy of the chemisorptive bond has random variations caused by the thermal fluctuations of the lattice atoms. Desorption occurs when the bond energy exceeds a certain value, placing the adsorbed particle in a continuum state of the surface-particle potential. The calculation of the rates of energy transfer includes multiphonon processes and allows transitions between all the bound levels of the adsorbed particle. Numerical calculations are presented in a subsequent paper. (25 refs.)

108170 Thermal desorption with the Smoluchowski equation. S.Shindo (Dept. of Phys., Tokyo Gakugei Univ., Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2637-8 (Aug. 1983).
The radiation boundary condition is derived for the Smoluchowski equation based on the Fokker-Planck equation. This is applied to the calculation of the desorption rate for the large friction coefficient. The friction dependence of the desorption rate is discussed. (8 refs.)

108171 Adsorption of hard spheres via the non-uniform Percus-Yevick equation. S.Sokolowski (Dept. of Theoretical Chem., Inst. of Chem., Marie Curie Sklodowska Univ., Lublin, Poland).
Mol. Phys. (GB), vol.49, no.6, p.1481-8 (20 Aug. 1983).
The author studies the adsorption of hard spheres on solids interacting according to potentials whose Boltzmann functions contain a δ-function. The nonuniform Percus-Yevick equation is solved by using the method introduced by Lado (1968) to study two dimensional fluids. (17 refs.)

108172 End-on and side-on bonding of ketones to surfaces: acetone on the Ru(001) and Pt(111) surfaces. N.R.Avery, W.H.Weinberg, A.B.Anton, B.H.Toby (Div. of Chemistry, California Inst. of Technol., Pasadena, CA, USA).
Phys. Rev. Lett. (USA), vol.51, no.8, p.682-5 (22 Aug. 1983).
High-resolution electron-energy-loss spectroscopy has verified the existence of two fundamentally different types of adsorbed acetone, η^1-bonded acetone on Pt(111) and η^2-bonded acetone on Ru(001). On a Ru(001) surface, the Lewis acidity of which has been increased by the presence of oxygen adatoms, the η^1 and η^2 forms of acetone coexist. The η^1-bonded acetone desorbs molecularly, whereas η^2-bonded acetone is a precursor to dissociation on the surface. (31 refs.)

108173 Efficient scheme for calculation of low-energy electron-diffraction intensities in the presence of large superlattices, with application to the structural analysis of benzene adsorbed on Rh(111). M.A.Van Hove, R.Lin, G.A.Somorjai (Dept. of Chem., Univ. of California, Berkeley, CA, USA).
Phys. Rev. Lett. (USA), vol.51, no.9, p.778-81 (29 Aug. 1983).
A powerful calculational low-energy electron-diffraction scheme is introduced for super lattices with unit cells of any size: beam-set neglect. It is applied in the first structural analysis from low-energy electron-diffraction intensities of a large molecule, benzene, adsorbed on a single-crystal metal surface, Rh(111). In a $({}_{13}^{31})$ lattice, benzene is found to lie flat on the surface, centered over HCP-type hollow sites. A planar, possibly distorted C_6 ring is found with Rh-C bond lengths of 2.35 ± 0.05 Å. (12 refs.)

108174 Experimental evidence of a roughening transition in adsorbed xenon multilayers. R.Miranda, E.V.Albano, S.Daiser, G.Ertl, K.Wandelt (Inst. fur Phys. Chem., Univ. Munchen, Munchen, Germany).
Phys. Rev. Lett. (USA), vol.51, no.9, p.782-5 (29 Aug. 1983).
In this letter evidence is provided for a roughening transition in adsorbed xenon multilayers on palladium. The layer-distinctive Xe $5p$ photoemission is used to measure adsorption isotherms as well as the relative equilibrium population of individual Xe layers. Below the roughening temperature T_R xenon adsorbs layer by layer. Above T_R simultaneous population of different layers takes place. (17 refs.)

108175 Evidence for Ising and Potts transitions in the ϵ-ζ transformation of two-dimensional O_2. R.Marx, B.Christoffer (Lab. fur Tieftemperaturphys., Univ. Duisburg, Duisburg, Germany).
Phys. Rev. Lett. (USA), vol.51, no.9, p.790-3 (29 Aug. 1983).
Two-dimensional O_2 physisorbed on graphite shows a structural and magnetic phase transition from the paramagnetic to the antiferromagnetic state. A high-resolution specific-heat measurement is presented which reveals that there are two successive phase transitions: first a three-state Potts transition, producing a distorted lattice being still paramagnetic, and second an elastically driven Ising transition from the paramagnetic to the antiferromagnetic state. (13 refs.)

108176 Anisotropic phase transition on uniaxial surfaces. W.Kinzel (Inst. fur Festkorperforschung, Julich GmbH, Julich, Germany).
Phys. Rev. Lett. (USA), vol.51, no.11, p.996-9 (12 Sept. 1983).
A centered rectangular lattice-gas model for the chemisorption of H on Fe (110) is studied by transfer-matrix scaling. The results indicate a new type of phase transition to a uniaxial modulated '(3×1)' phase with anisotropic critical behavior. (21 refs.)

108177 Wetting and thick-thin film transitions in a model of argon at a solid CO_2 substrate. R.Evans, P.Tarazona (H.H. Wills Phys. Lab., Univ. of Bristol, Bristol, England).
Phys. Rev. A (USA), vol.28, no.3, p.1864-8 (Sept. 1983).
Using a simple free-energy functional, the authors determined the location of the transition from partial to complete wetting and the thick-thin-film transition line for a mode of gaseous argon at a solid carbon dioxide substrate. The wetting transition temperature is significantly higher than that calculated by Ebner and Saam (1977) for the same model and the thick-thin transition line lies much closer to the bulk gas-liquid coexistence curve. The authors results suggest that thick-film formation will only occur for high temperatures and this is why such films have not been observed in computer simulations and in other recent studies of this model. The authors show that long-ranged transverse (parallel to the surface) pairwise correlations occur at the edge of the thick and thin films which coexist on the transition line. The range of these correlations becomes infinite at the surface critical temperature and, for the thick film, at the wetting transition temperature. (22 refs.)

108178 Determination of molecular orientation of monolayer adsorbates by optical second-harmonic generation. T.F.Heinz, H.W.K.Tom, Y.R.Shen (Dept. of Phys., Univ. of California, Berkeley, CA, USA).
Phys. Rev. A (USA), vol.28, no.3, p.1883-5 (Sept. 1983).
Optical second-harmonic generation has been used to deduce the average arrangement and orientation of *p*-nitrobenzoic acid molecules adsorbed at air-silica and ethanol-silica interfaces. An adsorption isotherm for the liquid-solid interface has also been obtained. (13 refs.)

108179 Surface roughness and influence on the properties of the selectivity of MoO_2. H.Ezbakhe, A.Donnadieu (Lab. de Spectroscopie II, Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
Phys. Status Solidi a (Germany), vol.78, no.2, p.607-14 (16 Aug. 1983). In French.
It is shown how the variation of the texture of metallic substrates influences the properties of the selectivity of molybdenum oxide (MoO_2, called 'black' molybdenum) thin films with a constant thickness. The obtained results are analysed as function of wavelengths and roughness parameters (amplitude and spatial frequency), measured before and after deposition of the thin film. (16 refs.)

108180 Ab initio cluster study of the interaction of fluorine and chlorine with the Si(111) surface. M.Seel, P.S.Bagus (IBM Res. Lab., San Jose, CA, USA).
Phys. Rev. B (USA), vol.28, no.4, p.2023-38 (15 Aug. 1983).
The interaction of atomic fluorine and chlorine with the Si(111) surface has been studied by using clusters of Si atoms to stimulate the substrate. The largest cluster contains ten Si atoms, representing the first four layers of the Si surface. An F or Cl atom is added to three high-asymmetry adsorption sites. In the on-top site, the halogen adatom is directly above a surface Si atom. The open and eclipsed sites are both threefold with the adatom at the center of a triangle of first-layer atoms. In the open site, the adatom is directly above a fourth-layer Si while in the eclipsed site it is above a second-layer Si. Ab initio Hartree-Fock wave functions have been calculated, and the energy of the system is studied as a function of the vertical distance of the adatom from the surface (first) Si layer. Equilibrium bond distances, vibrational energies of the adatoms, and binding energies for adsorption are calculated. Bonding mechanisms and properties for the different sites are compared. For the on-top site, the binding energy D_e is 3.2 eV (1.6 eV) for F (Cl), and the equilibrium distance from the surface r_e is 1.7 Å (2.2 Å). For F at the open site, two attractive minima are found: $R_e=1.3$ and -1.4 Å; D_e is found to be ~ 0.5 eV for both positions, the barrier height for penetration is ~ 1 eV. For Cl at this open site, D_e is 0.4 eV and r_e is 1.9 Å. The barrier height is 13 eV. At the eclipsed site, D_e is 0.5 eV (0.2 eV) for F (Cl) with r_e being 1.7 Å (2.2 Å). The calculated D_es for Cl indicate that the most stable chemisorption site for Cl on Si(111) is the onefold on-top site. The vibrational energies for the motion of Cl normal to the surface are found to be substantially different for sites with different surface coordination and should be experimentally accessible in electron-energy-loss spectroscopy. The difference of calculated core-ionization energies for F at the on-top site and at the open site are compared with observed X-ray photoelectron spectroscopy data. The results provide a model for understanding reactions relevant in plasma etching. (51 refs.)

108181 Resonant heating in photodesorption via laser-adsorbate coupling. Z.W.Gortel, H.J.Kreuzer (Dept. of Phys., Dalhousie Univ., Halifax, Nova Scotia, Canada), P.Piercy, R.Teshima.
Phys. Rev. B (USA), vol.28, no.4, p.Z119-24 (15 Aug. 1983).
Based on the master equation for photodesorption of molecules by resonant laser-molecular vibrational coupling and on the equation of heat conduction, the authors calculate the heating of the solid through transfer of laser energy resonantly absorbed in the internal vibration of the adsorbed molecule. For the system CH_3F on NaCl they find that for large laser intensity resonant heating can raise the surface temperature by some 30% for realistic surface-potential parameters. The desorption time, being mainly laser induced and not thermal, changes only by at most a factor of 2-3 as a result of resonant heating. (12 refs.)

108182 Direct structural study of Cl on Si{111} and Ge{111} surfaces: new conclusions. P.H.Citrin, J.E.Rowe, P.Eisenberger (Bell Labs., Murray Hill, NJ, USA).
Phys. Rev. B (USA), vol.28, no.4, p.2299-301 (15 Aug. 1983).
Surface extended X-ray-absorption fine-structure measurements show that the lowest-energy adsorption site for Cl on annealed Si{111}-(7×7), annealed Ge{111}-(2×8), and quenched Si{111}-($\sqrt{19}\times\sqrt{19}$) surfaces is the onefold-atop site. This is in contrast to earlier photoemission studies which suggested different sites for Cl on Si{111} vs. Ge{111}. The observed electronic differences between these two systems are shown to be due to matrix element effects. The measured geometries for both are in excellent agreement with recent parameter-free total-energy calculations. (22 refs.)

108183 Structural determination of Cl chemisorption on Si{111} and Ge{111} by total-energy minimization. G.B.Bachelet, M.Schluter (Bell Labs., Murray Hill, NJ, USA).
Phys. Rev. B (USA), vol.28, no.4, p.2302-4 (15 Aug. 1983).
The atomic geometry of Cl-Si{111} and Cl-Ge{111} has been determined by total-energy minimization. The calculations are done within the total-density-functional framework with the use of norm-conserving pseudopotentials. Cl is found to be most stable in the onefold-atop position on Si{111} and, in contrast to earlier belief, also on Ge{111}. This result agrees with recent surface extended X-ray-absorption fine-structure (SEXAFS) measurements on annealed surfaces. The calculated substrate-Cl bond lengths are in quantitative agreement with the SEXAFS results, and vibrational frequencies are predicted. (22 refs.)

108184 On existence of quantum diffusion of 2-D electrons at the surface. V.E.Kravtsov, I.V.Lerner (Inst. of Spectroscopy, Acad. of Sci., Troitsk, USSR).
Solid State Commun. (USA), vol.47, no.4, p.297-301 (July 1983).
A quantum diffusion of 2-D electrons at a metal substrate has been shown to arise because of surface-bulk interaction via hybridization provided that the surface Fermi momentum has been smaller than the bulk one. The diffusion coefficient D has been found to depend nonmonotonously on sample dimensions L. An initial decrease in D has turned into an increase for sufficiently large L. The minimum in D has nonanalytically depended on the hybridization constant: $D_{\min}\sim g^{4/3}$. The effects predicted have resulted from the instability of the zero-component nonlinear σ-model with respect to inclusion of certain symmetry—breaking terms which have proved to increase under RG transformations. (14 refs.)

108185 Investigation of the initial stages of oxidation of microcrystalline silicon by means of X-ray photoelectron spectroscopy. J.K.Gimzewski, S.Veprek (Inst. of Inorganic Chem., Univ. of Zurich, Zurich, Switzerland).
Solid State Commun. (USA), vol.47, no.9, p.747-51 (Sept. 1983).
XPS Si2*p* spectra of microcrystalline silicon (μc-Si), prepared by plasma chemical transport are reported and the initial stages of oxidation are studied. In comparison with single crystal Si(111) surfaces, μc-Si samples are remarkably resistant to surface oxidation. A short exposure to air results in negligible oxygen adsorption (intensity ratio of 01*s* to Si2*p* peaks is less than 0.018 after more than 3×10^{11} Langmuirs exposure to air). Intensive oxidation treatment is required to produce an oxide layer and evidence supporting a preferential grain boundary oxidation mechanism is presented. The surface plasmon structure observed in the Si2*p* spectrum provides complementary information on the remarkably low oxidation rate of the crystallite surfaces as compared to the grain boundaries. (28 refs.)

108186 Monohydride and dihydride formation at Si(100) 2×1: a high resolution electron energy loss spectroscopy study. F.Stucki, J.A.Schaefer, J.R.Anderson, G.J.Lapeyre, W.Gopel (Phys. Dept., Montana State Univ., Bozeman, MT, USA).
Solid State Commun. (USA), vol.47, no.10, p.795-801 (Sept. 1983).
Results from EELS and LEED investigations on the interaction of atomic hydrogen with the Si(100) 2×1 surface give direct evidence for the formation of two distinct surface phases: a monohydride Si(100) 2×1:H and a dihydride Si(100) 1×1::2H phase. Temperature and exposure time determine which of the two phases appears. An analysis of normal vibrational modes leads to an identification of hydrogen adsorption complexes in both phases. (23 refs.)

108187 Inelastic changes during the formation of multilayers of C_2H_6 on Ag(110). B.F.Mason, B.R.Williams (Nat. Res. Council Canada, Ottawa, Canada).
Surf. Sci. (Netherlands), vol.130, no.2, p.L329-36 (Aug. 1983).
Adsorption of C_2H_6 on Ag(110) has been studied using inelastic He atom scattering. Changes in the inelastic spectrum have been observed for the first time during adsorption up to three monolayers. No changes occurred as a fourth layer was added. The spectrum moves to lesser energy values. The ratio of the energy gain and loss events varies from layer to layer (at constant surface temperature). The (00) peak also reflects some changes in intensity during adsorption. (8 refs.)

108188 The effect of chain reactions on the diffusion of adsorbates. D.R.Bowman (James Franck Inst., Univ. of Chicago, Chicago, IL, USA).
Surf. Sci. (Netherlands), vol.130, no.2, p.348-60 (Aug. 1983).
A chain reaction mechanism is developed that can dramatically increase the predicted diffusion coefficient as a function of coverage for thermally activated submonolayer coverages of adsorbates weakly chemisorbed on surfaces. The key idea is that when a diffusing adatom encounters another adatom it will tend to forward scatter it (due to the channeling effect of the periodic potential of the substrate lattice), thus increasing the effective mean free path. The enhancement effect can be quite dramatic at large adsorbate coverages. The formalism is essentially that of a Markoffian random walk on a lattice which allows for 'billiard ball' type collisions. A general formalism for calculating the chemical diffusion tensor for an unspecified lattice is developed. The diffusion tensor is then related to the effective diffusion coefficient measured by the field emission fluctuation method. The special case of the two-dimensional rhombic lattice with two adsorbate species is worked out and shown to agree qualitatively with theoretical predictions of the coverage dependence of the diffusion coefficient with the experimental data for hydrogen and deuterium on W(110). (9 refs.)

108189 Theoretical studies on the standard but misleading adsorption isotherm. I. True adsorption isotherm. F.A.Shebl, M.Abd El-Khalik, F.M.Helmy (Dept. of Chem., Ain Shams Univ., Abbasia, Cairo, Egypt).
Surf. Technol. (Switzerland), vol.19, no.4, p.321-34 (Aug. 1983).
When an adsorbent contains micropores or specific adsorption sites, the adsorption isotherm is misleading. The monolayer capacity V_m is higher than the true monolayer capacity V_{mt} for a microporous solid and is lower than V_{mt} for a surface which is partly lyophobic. It is proposed that an amount x should be added or subtracted from the monolayer capacity determined using the Braunauer-Emmett-Teller method to calculate V_{mt}. The amount x is calculated from the n_R-n_s plot. A general equation is derived to calculate the value x and the true monolayer capacity as well as to draw the true adsorption isotherm just before capillary condensation. The equations derived are applied to two silica gels, one containing micropores and the other containing mesopores. Excellent agreement between theoretical and experimental results is obtained. (16 refs.)

108190 Adsorption of NO on a Rh-10% Pt (111) surface: non-uniform spatial distribution. P.H.Holloway (Dept. of Materials Sci. & Engng., Univ. of Florida, Gainesville, FL, USA), F.L.Williams.
Surf. & Interface Anal. (GB), vol.5, no.4, p.147-9 (Aug. 1983). (International Conference on Quantitative Surface Analysis, Teddington, England, 24-25 Nov. 1981).
Most studies of chemisorption now use single crystals in order to distinguish the effects of crystallite orientation upon absorption and to have a 'large, uniform' surface for measurement. Also, many of the analytical techniques require surface areas 1 mm in diameter for measurements. Most investigators implicitly assume that a single crystal will provide a uniform surface over these dimensions. This is not always true as is shown in this case for NO absorption on Rh-10% Pt (111) crystals. Therefore, the purpose of this communication is to show that high spatial resolution surface analysis can be very useful in studying surface/gas reactions, even on single crystal surfaces. (7 refs.)

108191 Paramagnetic relaxation of protons of water adsorbed on the aerosil surface. Yu.V.Shulepov, A.G.Bratunets, R.F.Shulepova.
Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1226-9 (Aug. 1983). In Russian.
The temperature dependence of the spin-lattice relaxation time of protons of water adsorbed on the A-175 aerosil surface is measured and calculated in terms of the surface diffusion model using the spin-temperature theory. The mean length of the proton jump and the movement activation energy are $b=1.64$ Å and $E_a=16.93$ kcal/mol, respectively. From comparison of the calculated and measured spin-lattice relaxation times of water protons in the presence of Mn(II) ions (concentration 1.14×10^{13} ion/cm^{-2}) a conclusion is made that the paramagnetic ion concentration becomes effectively lower due to the formation of submacroscopic globules of the $MnCl_2$, $Mn(OH)_2$, etc. type during the drying of the sample to achieve necessary humidity. (14 refs.)

108192 Electron- and photon-stimulated desorption benefits and pitfalls. T.E.Madey, D.L.Doering, E.Bertel, R.Stockbauer (Surface Sci. Div., NBS, Washington, DC, USA).
Ultramicroscopy (Netherlands), vol.11, no.2-3, p.187-97 (1983). (Surface Imaging and Analysis with High Spatial Resolution, Wickenburg Inn, AZ, USA, 12-15 Jan. 1983).
Electron beam irradiation of solids often results in damage-producing events along with information-producing events. The authors explore mechanisms of beam damage in solids, as well as examples of the benefits of electron- (and photon-) stimulated processes to study molecules at surfaces. Information about the geometrical structure of adsorbed species can be obtained from measurements of the angular distribution of ions released by electron- or photon-stimulated desorption. The directions of ion emission are directly related to the orientations of the surface bonds which are ruptured by the excitation. The method of electron-stimulated desorption ion angular distributions (ESDIAD) has proven particularly useful in characterizing local molecular structure at surfaces in the absence of long-range order; recent measurements of bonding configurations stabilized by impurities or by lateral interactions are discussed. Photon-stimulated desorption (PSD) studies using synchrotron radiation are providing new insights into fundamental electronic excitation processes at surfaces. Mechanisms for the excitation and desorption of ions are examined, and examples include ion desorption from adsorbed monolayers, as well as ion formation and desorption processes in condensed molecular films. 68.48 SOLID-SOLID INTERFACES

(inc. bicrystals; for grain boundaries, see 61.70N)

•**108193 Interface analysis by spectroscopic ellipsometry of $Ga_{1-x}Al_xAs$-GaAs heterojunctions grown by metal organic vapor phase epitaxy.** M.Erman, P.M.Frijlink (Lab. d'Electronique et de Phys. Appl., Limeil Brevannes, France).
Appl. Phys. Lett. (USA), vol.43, no.3, p.285-7 (1 Aug. 1983).
Metal organic vapor phase epitaxy (MOVPE) grown $Ga_{1-x}Al_xAs$-GaAs heterostructures have been analyzed by spectroscopic ellipsometry in the 1.6-5.4-eV region. The authors show that this technique is capable of a nondestructive analysis of the interface region. The method can distinguish between a physical interface (roughness, alloy clustering) and a chemical one (gradual changes in Al concentration). The results show that extremely sharp interfaces (of the order of one monolayer) can be grown by MOVPE. (12 refs.)

108194 Si-SiO_2 interface structures on Si (100), (111), and (110) surfaces. T.Hattori, T.Suzuki (Dept. of Electrical Engng., Musashi Inst. of Technol., Tokyo, Japan).
Appl. Phys. Lett. (USA), vol.43, no.5, p.470-2 (1 Sept. 1983).
The distributions of intermediate oxides (SiO_x, $0<x<2$) in ultrathin oxide films formed on (100), (111), and (110) surfaces were investigated by using the nondestructive measurements of Si 2*p* photoelectron spectra. The experimental observations can be understood as follows: (1) the abrupt interfaces are formed for three crystal orientations; (2) the interface formed at 1000°C on (100), (111), and (110) surface consists mainly of SiO, Si_2O, and the mixture of SiO and Si_2O, respectively; (3) Si_2O_3 is distributed in the oxide films for three crystal orientations. (8 refs.)

108195 Interfacial transition region between silicon and ultrathin plasma Si oxide. E.D.Atanassova (Inst. of Solid State Phys., Bulgarian Acad. of Sci., Sofia, Bulgaria), A.V.Shopov.
Appl. Surf. Sci. (Netherlands), vol.16, no.3-4, p.395-404 (July-Aug. 1983).
A depth profiling of ultrathin plasma Si oxide on Si is presented, based upon a combination of results obtained by Auger electron spectroscopy and low-energy electron loss spectroscopy with argon ion sputtering. The parameters of the interfacial transition region in dependence on oxide thickness and technology conditions are studied. It is concluded that the more interface is an attribute of a more perfect oxide. (39 refs.)

108196 Diffusion permeability of single interphase boundaries in the Cu-Mo system. B.S.Bokshtein, I.V.Videnskii, L.M.Klinger (Inst. of Steel & Alloys, Moscow, USSR).
Phys. Met. (GB). Translation of: Metallofizika, Kiev (USSR), vol.4, no.3, p.587-91 (1982). [received: Aug. 1983]
Diffusion along single interphase boundaries in bicrystals with a known crystallographic orientation was examined. Cu-Mo bicrystals grown by zone recrystallisation were used in the experiments. The results obtained are preliminary but allow several conclusions. 1. The difference in $D_b.\delta$ values the product of diffusivity and boundary width for interphase boundaries with different misorientation angles can be attributed to the different degree of atomic ordering. 2. For grain boundaries the activation energy of diffusion along a boundary with a higher diffusion permeability is lower, whereas for interphase boundaries the situation is just the opposite: the activation energy is higher, and D_0 grows even more rapidly. 3. The high D_0 value for the 15° interface (about 10^2 m^2/s) suggests that in these boundaries a relay type mechanism may work: a jump of one atom initiates jumps of other atoms displacing a chain of atoms. (12 refs.)

108197 Direct observation of lattice arrangement in MBE grown GaAs-AlGaAs superlattices. H.Okamoto, M.Seki, Y.Horikoshi (Musashino Electrical Communication Labs., Nippon Telegraph & Telephone Public Corp., Tokyo, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.6, p.L367-9 (June 1983).
Observation is made of a cross section including the growth direction of an MBE grown GaAs-$Al_{0.28}Ga_{0.72}As$ superlattice structure by a transmission electron microscope with a resolution of 1.4 Å. Relevant atoms are observed to be regularly aligned even across the heterointerface. There is no alloy clustering observed in the ternary alloy layer. Dislocations are clearly observed as a local disorder in lattice alignment for the first time in the MBE grown layer. (6 refs.)

108198 Chemical reaction at the annealed Si/Yb interface. G.Rossi, J.Nogami, J.J.Yeh, I.Lindau (Stanford Univ., Stanford, CA, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.530-2 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
The authors present the first evidence of formation of mixed valent compounds at the Si(111)/Yb interface upon annealing. Two stable and uniform compositions were found, these being related to the known bulk silicides YbSi and $YbSi_2$. The mixed valence behavior is seen in the presence of the strong $4f^{13}$ (Yb^{3+}) signal and in the shift of the $4f^{14}$ (Yb^{2+}) signal to the Fermi level. (11 refs.)

108199 Interface properties of *n*-ZnSe-*p*-Ge heterojunctions grown by organometallic chemical vapor deposition. J.G.Werthen, W.Stutius (Xerox Palo Alto Res. Center, Palo Alto, CA, USA), F.A.Ponce.
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.656-60 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Aluminum-doped, *n*-type ZnSe layers ranging in thickness from several thousand angstroms to several microns were grown epitaxially on differently oriented *p*-type Ge substrates by a low temperature, low pressure organometallic chemical vapor deposition process. The surface morphology and photoluminescence spectra reveal differences between the ZnSe films grown on (100)Ge substrates and those grown on (111)Ge substrates. Photoluminescence spectra of the former films show strong band gap luminescence, whereas the latter films are characterized by a reduced band gap luminescence intensity and an enhanced intensity in the self-activated region. The lattice structure of the ZnSe-Ge interface has been studied by high resolution transmission electron microscopy, and the electrical characteristics of the corresponding *n*-ZnSe-*p*-Ge heterojunctions have been measured. Heterojunctions formed on (100) oriented substrates show good diode behavior with dark saturation currents of 1×10^{-11} A/cm^2. Heterojunctions formed on (111) substrates are characterized by poor diode behavior with dark saturation currents of the order of 4×10^{-8} A/cm^2. The difference in the electrical transport properties is attributed to the distinctly different defect structure at the ZnSe-Ge heterojunction interface. (18 refs.)

108200 Some observations on Ge:GaAs(001) and GaAs:Ge(001) interfaces and films. J.H.Neave, P.K.Larsen, B.A.Joyce, J.P.Gowers, J.F.van der Veen (Philips Res. Labs., Redhill, England).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.668-74 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Ge:GaAs(001) and GaAs:Ge(001) interfaces and thin films have been prepared by molecular beam epitaxy (MBE) and studied in situ by reflection electron diffraction (RHEED), angle-resolved photoemission spectroscopy (ARPES), and core level photoemission. The film structures have also been examined by transmission electron microscopy (TEM). Ge films grown on GaAs(001) substrates have a $c(2\times2)$ surface symmetry and are free of extended defects and domain structures. ARPES measurements of Ge(001)-$c(2\times2)$ surfaces in the photon energy range 20-50 eV show the presence of two surface states and dispersing bulk states. Valence bands along the ΓX symmetry direction are derived on the basis of a free-electronlike final state. The quality of the Ge-GaAs(001) interface, however, is determined by the GaAs substrate reconstruction. Ge deposition on an intrinsic (2×4) reconstructed surface produces an abrupt interface, but when a $c(4\times4)$ chemisorption phase is used the distribution of arsenic across the interface region is diffuse. TEM examination of GaAs films on Ge(001) substrates has confirmed the presence of a domain structure in which the domains are distinguished by reversal of the polar axis. (37 refs.)

108201 Structural studies of InGaAs/GaAs and GaAsP/GaP strained-layer superlattices by ion channeling. S.T.Picraux, R.M.Biefeld, L.R.Dawson, G.C.Obourn (Sandia Nat. Labs., Albuquerque, NM, USA), W.K.Chu.
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.687 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Summary form only given. Investigates the application of the ion channeling technique to study the periodic layer structure of strained-layer superlattices. The objective is to develop a depth-sensitive probe of the strain in these modulated layer structures. The authors report ion channeling studies of the InGaAs/GaAs and the GaAsP/GaP strained-layer superlattices. The $In_{0.2}Ga_{0.8}As$/GaAs alternating layers were grown by MBE with a thickness per layer pair of 20 nm. The $GaAs_{0.16}P_{0.84}$/GaP layers were grown by MOCVD with a thickness per pair of 31 nm. (2 refs.)

108202 Nucleation and strain relaxation at the InAs/GaAs (100) heterojunction. W.J.Schaffer (Rockwell Internat. Sci. Center, Thousand Oaks, CA, USA), M.D.Lind, S.P.Kowalczyk, R.W.Grant.
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.688-95 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
The techniques of molecular beam epitaxy have been used to investigate the nucleation and growth of InAs heteroepitaxial thin films lattice mismatched to GaAs(100) substrates. The authors' previous observations have been that optimum structural and electrical properties are obtained only if the heteroepitaxial nucleation sequence is carried out under experimental conditions leading to the indium stabilized (4×2) InAs(100) surface reconstruction. In this work, reflection electron diffraction, Auger electron spectroscopy and X-ray diffraction have been used to determine the InAs(100) surface phase diagram. The InAs/GaAs(100) heterojunction grown by MBE is abrupt and smooth surfaces are obtained only under indium stabilized nucleation conditions. A residual compressive strain at the crystalline interface occurs which is somewhat relieved by a tetragonal distortion in the direction normal to the film plane. Results of investigations by reflection electron diffraction show that the nucleation of InAs/GaAs(100) occurs via island formation and coalescence, and that the initial in-plane lattice constant observed for InAs at 520°C is 5.9 Å. The unstrained lattice constant is obtained only after ~2000 Å of growth under indium stabilized conditions. If the InAs bond length in the vicinity of the interface is estimated from the experimental data, the agreement between the authors' previously measured (via XPS) value for the heterojunction

valence-band discontinuity and the calculation based on Harrison's (1977) model (LCAO) is improved. (26 refs.)

108203 Crystalline perfection of heteroepitaxial structures of $Al_{0.3}Ga_{0.7}P_yAs_{1-y}$-GaAs grown from the liquid phase. V.S.Krasil'nikov, V.N.Shcherbakov, E.V.Borodova (Gor'kii Physicotech. Res. Inst., N.I. Lobachevskii Gor'kii State Univ., Gor'kii, USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1521-5 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1772-6 (Nov. 1982).
The crystalline perfection of epitaxial layers of $Al_{0.3}Ga_{0.7}P_yAs_{1-y}$ and surface layers of GaAs substrates on which they are grown deteriorates when there is an increase in the misfit between the unit-cell parameters of the layer and substrate. The type of dislocation structure of the heteroboundaries in the $Al_{0.3}Ga_{0.7}P_yAs_{1-y}$-GaAs (001) system is determined both by the value and by the sign of the elastic stresses acting in the epitaxial layers. Predominance of thermal stresses is accompanied by induction of misfit dislocations oriented along one of the ⟨110⟩ directions. Predominant action of misfit stresses causes the formation of rectangular networks of misfit dislocations along both ⟨110⟩ directions, or leads to the formation of disordered dislocation networks. (12 refs.)

108204 Characterization of the Fe/MgO interface. R.Hubert, J.Darville, J.M.Gilles (Dept. de Phys., Facultes Univ. Notre-Dame de la Paix, Namur, Belgium).
Phys. Scr. (Sweden), vol.T4, p.179-82 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).
An iron film of 12 Å thickness is deposited onto a cleaved MgO (001) face and annealed up to 400°C in ultra high vacuum. Using Auger electron spectroscopy and low energy electron diffraction, it is shown that interdiffusion occurs across the interface around 300°C leading to an ordered solid solution. The behaviour of various contaminations is also studied. (10 refs.)

108205 Influence of substrate deformations on interface structures. I. Theory. J.Woltersdorf, E.Pippel (Inst. fur Festkorperphys. & Elektronenmikroskopie, Akad. der Wissenschaften, Halle (Saale),, Germany).
Phys. Status Solidi a (Germany), vol.78, no.2, p.475-83 (16 Aug. 1983).
The bicrystal deformations due to epitaxial stresses are calculated exactly within the framework of the linear theory of elasticity, but a zeroth and a first approximation sufficient for application are also presented. Besides the radius of curvature and the position of the neutral plane, the critical thickness for the occurrence of misfit dislocations and the dependence on the substrate relaxations—caused by the bicrystal bending—is given as a third parameter which can also be determined experimentally. (22 refs.)

108206 Coherence of the phase boundary and deformation in the epitaxial system Ge/GaAs. I.F.Mikhailov, M.Ya.Fuks, L.P.Koval', O.G.Alaverdova, Yu.A.Tkhorik, N.N.Soldatenko, L.A.Matveeva, L.S.Khazan (Polytechnic Inst., Khar'kov, Ukrainian SSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.2, p.215-17 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.368-71 (March-April 1983). [received: Sept. 1983]
The dislocation structure and residual deformation of a film and substrate are studied by X-ray diffractometry and topography. The residual stresses are due to mismatch between the periods of the film and substrate lattices. The thermal stresses in the system are very small. The phase boundary remains coherent up to a film thickness of about 5 μ, 30 times greater than the critical thickness calculated by the method of van der Merve. The deformation of the substrate layer adjoining the phase boundary is three times greater than that calculated from the 'bimetallic' model of the theory of elasticity, showing that there is a nonlinear stress distribution over the depth of the substrate. (11 refs.)

108207 Multilayered metal films with artificial superstructure. T.Shinjo.
Solid State Phys. (Japan), vol.18, no.5, p.271-7 (May 1983). In Japanese.
By alternate deposition of two elements, multilayered films with artificial superstructure are prepared. Examples are briefly reviewed. (30 refs.)

68.55 THIN FILM GROWTH, STRUCTURE, AND EPITAXY

(for techniques of crystal growth and film deposition, see 81.10 and 81.15)

108208 Low compensation vapor phase epitaxial gallium arsenide. P.C.Colter (Universal Energy Systems Inc., Dayton, OH, USA), D.C.Look, D.C.Reynolds.
Appl. Phys. Lett. (USA), vol.43, no.3, p.282-4 (1 Aug. 1983).
Vapor phase epitaxial arsenide (GaAs) layers, with lower compensation ratios than any reported heretofore, have been reproducibly grown by the $Ga/H_2/AsCl_3$ method. One of these samples has been studied extensively by electrical measurements and shows an acceptor concentration of $(2.0\pm0.7)\times10^{13}$ cm^{-3}, and a compensation rate of $N_A/N_D=0.06\pm0.02$. These numbers are supported by magnetophotothermal spectroscopy and photoluminescence measurements. The preparation involves growth on [211A] substrates, and a pregrowth bakeout of the Ga source, which results in a significantly lower Zn acceptor concentration in the layer. These reuslts have important implications for various compensation mechanisms which have been proposed for GaAs. (11 refs.)

108209 Measurement of compositional inhomogeneity of liquid phase epitaxial InGaPAs. P.E.Brunemeier, T.J.Roth, N.Holonyak,Jr., G.E.Stillman (Electrical Engng. Res. Lab., Univ. of Illinois, Urbana, IL, USA).
Appl. Phys. Lett. (USA), vol.43, no.4, p.373-5 (15 Aug. 1983).
Precision X-ray measurements have been performed on the compositional inhomogeneity that occurs during the initial part of the liquid phase epitaxial (LPE) growth of InGaPAs on InP substrates from step-cooled solutions. Double crystal X-ray diffraction and absorption data are presented on epitaxial layers grown short term (30 ms) and long term (1-2 min). These data are used to determine the difference in alloy composition of the two growth methods. This study indicates that long-term LPE growth of quaternary alloys is inhomogeneous, while short-term growth can be made uniform. (15 refs.)

108210 High-resistivity ($>10^5$ Ω.cm) InP layers by liquid phase epitaxy. E.A.Razek, L.M.Zinkiewicz, H.D.Law (TRW/Technol. Res. Center, El Segundo, CA, USA).
Appl. Phys. Lett. (USA), vol.43, no.4, p.378-80 (15 Aug. 1983).
Experimental conditions suitable for the liquid phase epitaxial growth of InP epilayers with resistivities $>10^5$ Ω cm have been investigated. It has been found that the resistivities of Fe-doped InP layers are, in fact, less than the resistivity of an undoped InP control sample. Furthermore, the resistivity decreases monotonically as more Fe dopant is added to the melt. When Co is used as a dopant, the same growth conditions used for the Fe-doped InP produce InP epilayers with $\rho>10^5$ Ω cm. High-resistivity InP layers have been reproducibly grown with 1.0 and 0.6 at.% of Co added to the melt. The high-resistivity InP epilayers have been grown at various temperatures between 715 and 630°C. (12 refs.)

108211 A study of meniscus lines on the surface of LPE-GaAs. Zhou Bojun, Wu Rangyuan (Inst. of Semiconductors, Acad. Sinica, Beijing, China).
Chin. J. Semicond. (China), vol.4, no.4, p.395-8, 414 (July 1983). In Chinese.
The meniscus lines on LPE-GaAs surface are affected by the speed, temperature and direction of the wafer leaving the growth liquid, by the As partial pressure of the gas flow and by the gap between the surface of the epitaxial layer and the frame bottom of the liquid bath. Based on these phenomena, the concept of 'semi-circumferential line instant local meltingback' is postulated, which can interpret the cause of forming meniscus lines. (3 refs.)

108212 Influence of source composition on the properties of flash-evaporated thin films in the Cu-In-Se system. H.Neumann, B.Schumann, E.Nowak, A.Tempel, G.Kuhn (Sektion Phys., Karl-Marx-Univ., Leipzig, Germany).
Cryst. Res. & Technol. (Germany), vol.18, no.7, p.895-900 (1983).
Using $CuIn_2Se_{3.5}$ as source material epitaxial layers are obtained on (111)A- and (100)-oriented GaAs substrates by flash evaporation in the substrate temperature range $T_{sub}=720-870K$. The composition of the films is between $CuInSe_2$ and $CuIn_2Se_{3.5}$. The structural properties of the films are similar to those for $CuInSe_2$ epitaxial layers and refer to a chalcopyrite-like structure. The films are always p-type conducting but different acceptor states are found in dependence on the substrate temperature. (18 refs.)

108213 Mismatch and electron mobility in MBE $Ga_xIn_{1-x}As$ epitaxial layers on InP substrates. J.Massies (Lab. Phys. du Solide et Energie Solaire, CNRS, Valbonne, France), M.Sauvage-Simkin.
Appl. Phys. A (Germany), vol.A32, no.1, p.27-30 (Sept. 1983).
Composition inhomogeneity in nearly matched epilayers of the ternary semiconductor alloy $Ga_xIn_{1-x}As$ (x close to 0.47), grown by molecular beam epitaxy (MBE) on (001) InP substrates is correlated to variation of the lattice mismatch by X-ray imaging and local diffractometry. Misfit dislocations are shown to develop in areas of large misfit (above 2×10^{-3}) and are at the origin of a severe degradation of the electron mobility: an increase by a factor of about 4 in the intrinsic misfit (2.3×10^{-3} compared to 0.6×10^{-3}) results in a 35% reduction of the 77K electron mobility. (17 refs.)

108214 Internal stress in evaporated tellurium films. K.Okuyama (Dept. of Electronic Engng., Faculty of Engng., Yamagata Univ., Yonezawa, Japan).
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.934-7 (June 1983).
The internal stress and electrical resistivity were measured during and after deposition for tellurium films evaporated on a glass substrate. Both tensile and compressive stresses were observed depending on the substrate temperature during deposition. For the films deposited at room temperature, a tensile stress was generated accompanied by a drastic decrease in the resistivity. In contrast, a compressive stress was initially developed in the films deposited at 100°C and then the stress changed into the tensile one as the deposition progressed. The experimental results were interpreted in terms of the phase change mechanism and the lattice expansion and grain boundary annealing mechanisms, respectively. (10 refs.)

108215 Formation and properties of the copper silicon (111) interface. F.Ringeisen, J.Derrien (ISEA-Univ. de Haute-Alsace, Mulhouse, France), E.Daugy, J.M.Layet, P.Mathiez, F.Salvan.
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.546-52 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
The initial stages of the Cu growth on top of a 7×7 Si(111) surface were monitored with LEED, AES, UPS, and XPS techniques. Results suggest that at room temperature the Cu growth proceeds by a laminar fashion. An intermixing between Si and Cu takes place giving rise to a diffuse interface extending to several first monolayers. This fact is testified by the splitting of the Si *LVV* transition in AES spectra, by the deviation of the AES and XPS Cu and Si signal plot versus coverage from a perfect layer by layer growth plot, and by a strong diffuse background intensity in the LEED diagram. Moreover, at this coverage range, a slight narrowing and a shift (0.7 eV±0.2 eV) of the 3*d* Cu peak towards higher binding energy as compared with the bulk metal are observed in valence band photoemission spectra. With increasing coverage, a metal rich phase is found displaying an ordered 1×1 Cu(111) planelike structure. No Si enrichment at the topmost metallic layer is observed by XPS. Core level spectroscopy gives similar results showing a noticeable energy shift (0.6 eV±0.2 eV) for the Cu 2*p* line. A depth profile confirms the interface structure which is rather metastable at room temperature. At high temperature ($T>400$°C), an ordered Cu induced pattern is found at $\theta\sim1$ monolayer. The diagram resembles a 5×5 superstructure. With increasing coverage, 3D crystallites are growing on top of the first ordered layer. The interface is stable at high temperature. (40 refs.)

108216 Epitaxial growth of Ag films on Ge(001). J.R.Lince, J.G.Nelson, R.S.Williams (Dept. of Chem. & Biochem., Univ. of California, Los Angeles, CA, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.553-7 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
The deposition of thin films of Ag on clean Ge(001) substrates has been investigated using low energy electron diffraction, Auger electron spectroscopy, and scanning electron microscopy. Ag was deposited from an effusion source onto Ge at both 325 and 600K substrate temperatures. Deposition on high temperature substrates resulted in the formation of Ag islands with no

apparent crystalline order, whereas films deposited at temperatures near 325K onto clean Ge(001) 2×1 surfaces were oriented. The deposition of the equivalent of one Ag(001) monolayer on the Ge surfaces resulted in a Ge(001) 1×1-like LEED pattern. As deposition was continued (up to 500 monolayers), a pattern evolved which is consistent with two (011) 1×1 Ag domains oriented at 90° to one another. This behavior is interpreted in terms of a predominantly Stranski-Krastanov growth mechanism for the initial deposition of Ag onto near room temperature Ge(001) substrates. Annealing of a sample with a thin, ordered film revealed the original Ge(001) 2×1 LEED pattern, which demonstrated that the chemical interaction between Ge and Ag is very weak. (28 refs.)

108217 Palladium on GaAs: a reactive interface. P.Oelhafen, J.L.Freeouf, T.S.Kuan, T.N.Jackson, P.E.Batson (IBM Res., Yorktown Heights, NY, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.588-92 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
The authors have studied the formation and properties of ≈15 nm films of Pd on GaAs(100) and (110) substrates as a function of annealing temperature. Ultraviolet and X-ray photoelectron spectra (UPS and XPS) have established several distinctive phases; coupled with scanning electron microscopy studies, agglomeration has been observed at elevated temperatures. Transmission electron diffraction studies permit more detailed phase identification at specific temperatures. Electrical studies permit characterization of both interface properties and bulk transport properties of the reacted layer. In contrast to previous work, the authors find no Pd-As binary phases. After high temperature anneals (T_a>350°C), only PdGa is observed; these films are not continuous, but form [often epitaxial on (100) substrates—with (110)PdGa$\|$ (100)GaAs and $[\bar{1}1\bar{1}]\|[011]$GaAs] islands. After low temperature (≈250°C) anneals of Pd films on (110) substrates, small crystallites of PdGa are imbedded in the dominant matrix of a ternary single crystal phase. Energy dispersive X-rav analysis and XPS core level intensities suggest that this phase has the nominal composition of Pd_2GaAs. Metallic Ga is inferred after room temperature deposition from He II UPS studies of the Ga 3*d* core level. (26 refs.)

108218 Structure of the Al-GaP(110) and Al-InP(110) interfaces. A.Kahn, C.R.Bonapace (Dept. of Electrical Engng. & Computer Sci., Princeton Univ., Princeton, NJ, USA), C.B.Duke, A.Paton.
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.613-17 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
The Al-GaP(110) and Al-InP(110) interfaces are characterized with low energy electron diffraction and Auger electron spectroscopy. Both interfaces are reactive, i.e. the replacement of the cation by Al is thermodynamically favorable. However, Al evaporated on the room temperature substrates has a high surface mobility and forms metallic islands which leave the atomic structure of the uncovered semiconductor areas unperturbed. Limited Al-substrate reaction can be detected at room temperature. Moderate annealing triggers a large scale Al-cation replacement reaction and leads to the formation of AlP layers. The crystalline quality of the AlP layers is good for Al on GaP (0.01% lattice mismatch between AlP and InP) and poor for Al on InP (7% lattice mismatch between AlP and InP). The atomic geometry of AlP(110) is analyzed with multiple scattering LEED computation. A best fit structure is obtained which is consistent with the correlation recently obtained between atomic structure and atomic size on (110) semiconductor compound surfaces. (20 refs.)

108219 Instabilities of (110) III-V compounds grown by molecular beam epitaxy. W.I.Wang (Microelectronics Res. & Dev. Center, Rockwell Internat., Thousand Oaks, CA, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.630-6 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
The author has grown GaAs and AlGaAs on (110)-oriented GaAs substrates by molecular beam epitaxy (MBE). The epitaxial growth was studied in situ by reflection high energy electron diffraction. Hall measurements, low temperature photoluminescence, and scanning electron microscopy were used to characterize the epitaxial layers. Significant instabilities were found for this orientation under the growth conditions employed. The experimental results are discussed with bonding considerations of the (110) surfaces. (12 refs.)

108220 Damped oscillations in reflection high energy electron diffraction during GaAs MBE. J.M.Van Hove, C.S.Lent, P.R.Pukite, P.I.Cohen (Dept. of Electrical Engng., Univ. of Minnesota, Minneapolis, MN, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.741-6 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Oscillations in the time evolution of electron diffraction during MBE growth of GaAs are shown to be related to periodic variations in the step distributions on GaAs surfaces during epitaxial growth. Unintentionally doped GaAs surfaces were first prepared by MBE. Then the Ga flux is interrupted until an instrument limited diffraction pattern was obtained. During this process the angular width of the specular beam was measured versus time. When the Ga flux is reapplied there are intensity oscillations that are weak near the Bragg angle. At the Bragg angle, where the diffraction is insensitive to surface steps, the length of the specular RHEED streak does not change. At angles between the Bragg angles, where steps lengthen the streaks, there are periodic variations in the streak length. The authors interpret the results in terms of a model in which a partially completed surface has a step distribution with smaller average terrace lengths than a completed surface. (12 refs.)

108221 MBE growth and characterization of single crystal silicon oxides on (111) and (100) silicon. T.J.Maloney (Varian Associates Inc., Palo Alto, CA, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.773-7 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Silicon molecular beam epitaxy has been used to prepare thin (500 Å) films of single crystal silicon oxide material, having from 25%-30% oxygen content, on (111) and (100)Si wafers. The films, called SiO_z herein, were grown by evaporating silicon in the presence of oxygen at a wafer temperature around 675°C. Single crystal films of pure silicon on top of (111) SiO_z films have also been grown. The oxide material may be single crystal Si_2O on (111)Si, but the ease of growing SiO_z films on (100)Si indicates that perhaps oxygen incorporates in some other way. Auger data resembled AES data for amorphous SIPOS, while capacitance-voltage measurements possibly indicated a band gap step. This form of SiO_z could be very significant if it can be used as a wide band gap semiconductor, compatible with silicon, and suitable as a wide band gap emitter for heterojunction bipolar transistors and ICs. (14 refs.)

108222 Time and temperature dependences of phosphorus evolution from InP. L.G.Van Uitert, P.K.Gallagher, S.Singh, G.J.Zydzik (Bell Labs., Murray Hill, NJ, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.825-6 (July-Sept. 1983).
Indium phosphide decomposes evolving phosphorus at temperatures below 360°C in vacuum. Hence, heating in this range during processing epitaxial InGaAs films on InP substrates may lead to surface contamination of the active layer by phosphorus. This contamination can be minimized at elevated temperatures by initially depositing a passivating layer over the exposed parts of the substrate and/or active film well below the decomposition range of the substrate (e.g., at 250°C) and then sintering the film directly or while continuing deposition at a higher temperature. The vapor pressure of phosphorus evolved from InP increases by an order of magnitude for each 45°C increase in temperature. (3 refs.)

108223 Structural transformations in polycrystalline cadmium selenide films. V.S.Grinevich, V.E.Polishchuk, V.V.Serdyuk, V.A.Smyntyna (I.I. Mechnikov Odessa State Univ., Odessa, USSR).
Inorg. Mater. (USA), vol.18, no.8, p.1064-8 (Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.8, p.1262-6 (Aug. 1982).
Recrystallisation with the formation of the hexagonal CdSe modification occurs upon thermal ageing, which increases the anisotropicity of a cadmium selenide semiconductor film characterised by compression of the crystallite unit cell. Relaxation of the original structural defects occurs during natural ageing with restoration of the cell parameters to literature values in the course of an increase in the interplanar distances. (14 refs.)

108224 Structural organisation of amorphocrystalline films of lead tin telluride during annealing in vacuo and in oxygen. A.P.Gorchakov, Yu.A.Zarif'yants, O.I.Tananaeva (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
Inorg. Mater. (USA), vol.18, no.8, p.1075-7 (Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.8, p.1275-7 (Aug. 1982).
The use of X-ray diffraction analysis and IR spectroscopy has established that there is a dependence of structural and compositional changes of films obtained by rapid evaporation on a cold support, on the environment during low-temperature annealing. The shift and change in form of the absorption-band edge of films subjected to these treatments have been investigated. (7 refs.)

108225 Phase composition and electrophysical properties of EuS- and Sm-based films. L.S.Palatnik, V.E.Marincheva, M.N.Naboka, V.N.Tupikina, L.A.Mineeva, M.L.Mal'tseva (V.I. Lenin Kharkov Polytech. Inst., Kharkov, Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.11, p.1534-7 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1788-91 (Nov. 1982).
The elemental and phase compositions of thin condensed layers of the quasi-binary system EuS-Sm have been studied by chemical, spectral and X-ray analyses and electrophysical measurements. The films of a variable composition in the system EuS-Sm also contain the phases SmS, SmO and $Sm(OH)_3$ in addition to $Eu_{1-x}Sm_xS$ solid solutions. The semiconductor-metal phase transition has been noted in the system EuS-Sm. (7 refs.)

108226 Influence of supercooling on the compositional homogeneity of $InAs_{1-x}Sb_x$ solid solutions in the case of liquid-phase epitaxy. R.Kh.Akchurin, S.R.Borisov, V.B.Ufimtsev (M.V. Lomonosov Moscow Inst. of Fine Chem. Technol., Moscow, USSR).
Inorg. Mater. (USA), vol.18, no.9, p.1256-8 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1471-4 (Sept. 1982). [received: Sept. 1983]
Epitaxial accumulation under isothermal conditions from supercooled solution melts makes it possible to obtain homogeneous epitaxial layers of $InAs_{1-x}Sb_x$ with x=0.65-0.67, the extent of which reaches 4-12 μm in the direction of growth. The thickness of the constant composition region is strongly influenced by the magnitude of the initial supercooling: on increasing this to values close to that of critical supercooling (ΔT=18K), the thickness of the region decreases, apparently due to the start of homogeneous nucleation in the solution melt. (5 refs.)

108227 On the formation of electroless amorphous layers. I. Phenomenological description of NiP deposited on Cu and Fe substrates. A.Szasz, J.Kojnok, L.Kertesz (Inst. for Solid State Phys., Eotvos Univ., Budapest, Hungary), Z.Hegedus.
J. Non-Cryst. Solids (Netherlands), vol.57, no.2, p.213-24 (1 Sept. 1983).
The formation of amorphous NiP coating by electroless deposition on to copper and iron substrates has been followed by soft X-ray emission spectroscopy (SXES), X-ray diffraction (XRD) and transmission electron microscopy (TEM). Three different stages of formation can be distinguished. The first period is nucleation in an essentially two-dimensional layer where the formation of nuclei depends on the number and properties of the active sites on the underlying substrate layer. There is a three-dimensional spherical growth in the second stage. The concentration of phosphorus increased in the interspherical area. A relatively slow two-dimensional growth is characteristic of the third stage giving rise to a bright outer surface of the coating. (22 refs.)

108228 Prediction of kinetically controlled surface roughening: a Monte Carlo computer-simulation study. J.Singh, A.Madhukar (Dept. of Materials Sci. & Phys., Univ. of Southern California, Los Angeles, CA, USA).
Phys. Rev. Lett. (USA), vol.51, no.9, p.794-7 (29 Aug. 1983).
The existence of a surface roughening under far-from-equilibrium conditions is demonstrated. Roughening is critically controlled by surface kinetic processes, such as the atomic migration rate. Monte Carlo simulations are presented for a model of molecular-beam epitaxial growth of tetrahedrally bonded compound semiconductors. It is proposed that the roughening reported for GaAs/AlAs(100) growth, if intrinsic, corresponds to the kinetic surface roughening predicted here rather than that predicted by Burton, Cabrera, and Frank (1951) for surface-vapor equilibrium. (17 refs.)

108229 Application of the 'negative decoration' phenomenon of thin film growth in surface studies. P.B.Barna, G.Barcza (Res. Inst. for Tech. Phys., Hungarian Acad. of Sci., Budapest, Hungary).
Phys. Scr. (Sweden), vol.T4, p.197-8 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).
The results of experiments on the epitaxial growth of two dimensional islands of $AuAl_2$ grown at gold deposition on the (111) crystal faces of as deposited Al films are reviewed. Formulation of holes and scalloping of islands have been found on crystal faces exposed to various doses of oxygen before gold deposition. These holes, i.e. uncovered areas of Al crystals faces, decorate the islands of adsorbates or oxide developed during oxygen exposure. This 'negative decoration' phenomenon of thin film growth presents a new method suitable for studying the distribution and shape of the products of surface chemical interactions. (10 refs.)

108230 Atomic composition of RF-sputtered alumina coatings determined by XPS method. T.Mantyla, R.Jarvinen, P.Kettunen, P.Huttunen, M.Pessa (Tampere Univ. of Technol., Tampere, Finland).

Phys. Scr. (Sweden), vol.T4, p.199-200 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).

The O/Al ratios of RF-sputtered alumina coatings were analyzed by the XPS (ESCA) method. The coatings were prepared from an Al_2O_3 target by two commercial deposition devices. The effects of the following deposition parameters on the chemical composition of the coatings were studied: sputtering voltage from 1.3 to 1.9 kV, bias voltage from 0 to -100 V, excess oxygen partial pressure from 0 to 4%, and total pressures from 0.6 to 2.0 Pa. The sputtering gas was argon. The measured values of the O/Al ratio varied from 1.33 to 1.50 in the alumina coatings. The compositions were very close to stoichiometry when excess oxygen of 1% and bias voltage of -100 V were applied. However, a deviation in the O/Al ratio was found when the deposition was carried out at a high excess oxygen concentration of 4% which yielded a very oxygen deficient coating with the O/Al ratio of only 1.01. The sputtering voltage and the total pressure had no observable effects on the chemical composition. (4 refs.)

108231 Study of the crystalline structure of HgTe thin layers. I.Spanulescu (Faculty of Phys., Univ. of Bucharest, Bucharest, Rumania), M.I.Abd El-Ati, I.Dima.

Rev. Roum. Phys. (Rumania), vol.28, no.6, p.529-32 (1983).

The method of obtaining HgTe thin films with a small deviation from stoichiometry is presented. The crystalline structure of the obtained samples was studied and the exact value of the crystalline lattice parameter was computed. (20 refs.)

108232 Structure and bonding of hydrocarbon plasma generated carbon films: an electron energy loss study. J.Fink, T.Muller-Heinzerling, J.Pfluger (Inst. fur Angewandte Kernphys. I, Kernforschungszentrum Karlsruhe, Karlsruhe, Germany), A.Bubenzer, P.Koidl, G.Crecelius.

Solid State Commun. (USA), vol.47, no.9, p.687-91 (Sept. 1983).

Electron energy loss spectroscopy has been used to study the structure and the bonding in hard amorphous carbon films (a-C:H) prepared by plasma decomposition of benzene. EXAFS spectra indicate an amorphous and not a microcrystalline structure for a-C:H films. The near-edge structure of the carbon K-absorption edge reveals a considerable amount of π bonding in the a-C:H films. The optical constants were derived by a Kramers-Kronig analysis of the loss functions for energies less than 40 eV. From the sum rule for ϵ_2, the authors derive that 1/3 of the carbon atoms are trigonally bonded and 273 of the carbon atoms are tetrahedrally bonded. (14 refs.)

108233 LEED analysis of solid phase epitaxy of Si. V.V.Korobtsov, V.G.Zavodinskii, A.V.Zotov (Inst. of Automation & Control Processes, Acad. of Sci., Vladivostok, USSR).

Surf. Sci. (Netherlands), vol.130, no.2, p.L325-8 (Aug. 1983).

The LEED technique has been used to study the solid phase epitaxial growth of silicon. The crystalline quality of the film surface, the growth rate and the activation energy have been determined. A comparison of these results with those obtained by other authors has been made. (12 refs.)

108234 Nature of group Ib metal films deposited on polymer surfaces photooxidised with far-ultraviolet (185 nm) radiation. R.Srinivasan, V.B.Jipson, M.J.Poirier (IBM Thomas J. Watson Res. Centre, Yorktown Heights, NY, USA).

Surf. Sci. (Netherlands), vol.130, no.2, p.L344-58 (Aug. 1983).

Solid samples of three polymers (polymethyl methacrylate, polycarbonate and polyimide), whose surfaces were photooxidised with far-ultraviolet (185 nm) radiation in air, were used as substrates for the deposition of gold, silver, and copper films in vacuo. The electrical conductivities of the films were studied in situ as a function of the film thickness (0-15 nm). At a thickness of 10 nm, silver films showed 10^4 greater conductivities when deposited on the treated surfaces of all three polymers. Gold films showed no detectable differences between treated and untreated surfaces. Copper behaved similar to gold on PMMA but showed somewhat greater sensitivity (<20 at 5.4 nm thickness) on photooxidised polyimide. Transmission electron microphotographs of silver films on treated and untreated surfaces showed that photooxidation of the polymer caused the metal to be deposited with better coverage of the surface, i.e. with fewer voids. A partial explanation for the observations would be that photooxidation increases the number of nucleating sites for the metal on the polymer surface. In some way, this must be specific to silver because the effect does not extend to either a more reactive element such as copper or a less reactive element such as gold. (12 refs.)

108235 Superlattices formed by electrodeposition of silver on iodine-pretreated Pt(111); studies by LEED, Auger spectroscopy and electrochemistry. J.L.Stickney, S.D.Rosasco, D.Song, M.P.Soriaga, A.T.Hubbard (Dept. of Chem., Univ. of California, Santa Barbara, CA, USA).

Surf. Sci. (Netherlands), vol.130, no.2, p.326-47 (Aug. 1983).

Reported are studies by LEED and Auger spectroscopy of silver layers electrodeposited on well-characterised Pt(111) surfaces from aqueous solution. Prior to electrodeposition, the Pt(111) surface was treated with I_2 vapour to form the Pt(111) $(\sqrt{7}\times\sqrt{7})R19.1°$-I superlattice which protected the Pt and Ag surfaces from attack by the electrolyte and residual gases. Electrodeposition of silver occurred in four distinct ranges of electrode potential. Ordered layers having (3×3) and (18×18) (coincidence lattice) LEED patterns were formed at all coverages from the onset of deposition to the highest coverages studied, about twenty equivalent atomic layers. Formation of ordered Ag layers has therefore been demonstrated, at least for deposits of limited thickness. Auger spectra revealed that for deposits of a few atomic layers. The iodine layer remained unattached to the surface during multiple cycles of electrodeposition and dissolution of silver from iodine-free solution. Each peak of the voltammetric current-potential scan produced a change in the LEED pattern. (40 refs.)

108236 The structure of amorphous boron films. L.S.Palatnik, A.A.Koz'ma, A.A.Nechitailo (Polytech. Inst., Khar'kov, Ukrainian SSR).

Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.73-7 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR),* vol.28, no.1, p.136-42 (Jan.-Feb. 1983). [received: Sept. 1983]

X-ray diffractometry is used to study the short-range order substructure of the atomic positions in amorphous films of boron (B^a) condensed in a vacuum of 10^{-7} torr. On the basis of an analysis of the atomic radial distribution curves in amorphous boron and in its crystalline modifications, the authors suggest a model for the substructure of B^a. In amorphous boron the ^{12}B icosahedra are distorted on account of the absence of at least 10% of the atoms from their vertices and the presence of about the same number of B* atoms in the interstices between the distorted icosahedra. These point defects (vacancies V and interstitial atoms B*) are nonuniformly distributed in B^a and form V-B* pairs, analogous to Frenkel pairs in crystals, but in concentrations which are greater by several orders of magnitude. This nonuniform distribution can be represented in the form of a periodic function with a period equal to twice the distance between the distorted icosahedra ^{11}B. At low substrate temperatures, $T_s=50°C$, the distorted icosahedra are arranged in a disorderly fashion. At higher temperatures, $T_s=425\text{-}550°C$, microordering occurs. There is partial recombination of the V-B* pairs, the distortion of the icosahedra is reduced, and short-range order appears in their arrangement, approaching the short-range order in the arrangement of ^{12}B icosahedra in the metastable modification B_{50}. (13 refs.)

108237 Influence of an epitaxial substrate on the growth rate of ammonium iodide crystals. I.M.Gaidamako, E.B.Treivus, I.E.Kamentsev (State Univ., Leningrad, USSR).

Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.117-18 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR),* vol.28, no.1, p.200-2 (Jan.-Feb. 1983). [received: Sept. 1983]

KI crystals epitaxially grown on a joint between concreted muscovite and biotite are asymmetrical. This is evidence that the substrate influences the growth rates of the crystals which are grown on it. The authors investigate this influence in the case of NH_4I crystals. An epitaxial substrate not only exerts an orientating influence on crystals growing upon it and determines the probability of nucleation of these crystals, but also may influence the growth rates of the faces. (7 refs.)

108238 Interpreting light scattering patterns by means of optical diffraction. V.A.Gudkov, I.G.Chistyakov (Inst. of Crystallography, Acad. of Sci., USSR).

Sov. Phys.-Crystallogr. (USA), vol.28, no.2, p.211-14 (March-April 1983). Translation of: *Kristallografiya (USSR),* vol.28, no.2, p.363-7 (March-April 1983). [received: Sept. 1983]

A method is suggested for determining the supermolecular structure of polymer films, based on optical Fourier transformation of the patterns of scattering of light. Each one is reduced a hundredfold and Fraunhofer diffraction is effected with the reduced negative image. It is shown that the result of an optical Fourier transformation of the pattern of scattered light is the self-convolution function of the macrostructure, in which the form of the elements of the macrostructure and the character of their relative arrangement is reflected. The proposed method is used to investigate the macrostructure of a polythene film. (8 refs.)

108239 Imaging of atomic steps on ultrathin Au films by TEM. M.Klaua, H.Bethge (Inst. fur Festkorperphys. und Elektronenmikroskopie, Akad. der Wissenschaften, Halle/Saale, Germany).

Ultramicroscopy (Netherlands), vol.11, no.2-3, p.125-9 (1983). (Surface Imaging and Analysis with High Spatial Resolution, Wickenburg Inn, AZ, USA, 12-15 Jan. 1983).

Monatomic steps were studied on ultrathin Au films of 1 to 30 monolayer thickness by TEM. Au(111) and Au(100) films were prepared by evaporation of Au onto Ag growth faces in vacuum, following the evaporation of a C film as supporting replica. Au film and C replica were dissolved electrolytically from the Ag substrate. Goniometer tilting was used for setting optimum step contrasts in the microscope. Maximum contrast changes per monolayer are obtained by excitation of a systematic row with nearest (111) or (200) reflections. The thickness dependence of the contrast changes is opposite in bright-field and dark-field micrographs, respectively. Monatomic steps are imaged simultaneously on both sides of the Au film, the Au-vacuum surface and the former Au-Ag interface. Measured intensity changes are discussed in comparison with theoretical extinction curves. Step imaging is applied to the investigation of growth modes of Au films depending on substrate temperature. (7 refs.)

108240 Characteristics of recrystallised polysilicon on SiO_2 produced by dual electron beam processing. J.R.Davis, R.A.McMahon, H.Ahmed (Engng. Dept., Cambridge Univ., Cambridge, England).

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.563-8

Describes the production of large areas of precisely oriented, defect-free, single crystal silicon films on SiO_2 by dual electron beam heating of deposited polysilicon using lateral epitaxy. Defects which occur in the film far from the seeding window are characterised, and the dependence of the area of the defect-free region on the processing conditions is discussed. (6 refs.)

108241 Linear zone-melt recrystallized Si films using incoherent light. A.Kamgar, G.A.Rozgonyi, R.Knoell (Bell Labs., Murray Hill, NJ, USA).

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.569-74

Incoherent tungsten radiation has been used to recrystallize polysilicon films deposited on SiO_2, grown on 75 mm diameter wafers. These films have been analyzed by a variety of techniques such as optical microscopy, Auger spectroscopy and TEM cross sectioning. These films are large (>50 mm dia.) single crystals, and contain fewer defects and impurities than similar films recrystallized in graphite strip heater ovens. They do, however, contain the subgrain boundaries found previously, even when high purity MBE polysilicon is used. In vertical TEM cross-sectioning, in addition to the subgrain boundaries, the authors have seen crystallized particles of 50-200 Å size in the Si film at both the upper and lower SiO_2 boundaries. Although these particles could be related to formation of the subgrain boundaries, no definite correlation has been made. (11 refs.)

68.60 PHYSICAL PROPERTIES OF THIN FILMS, NONELECTRONIC

108242 Investigation of the chemical bonding of Cr and Ti to silicon nitride. T.W.Orent, R.A.Wagner (Honeywell Corporate Technol. Center, Bloomington, MN, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.844-9 (July-Sept. 1983).
The adhesion characteristics of RF-sputtered Cr/Cu and Ti/Cu films to polished silicon nitride substrates were studied. As-deposited samples showed lower rupture strengths than Cr/Cu on unpolished alumina, but Ti samples that had been annealed above 500°C and Cr films on substrates that had been prefired inair had higher rupture strengths than Cr/Al_2O_3. The compositions of the metal/substrate interfacial regions were studied by Auger depth profiling and by X-ray photoelectron spectroscopy, and the results were correlated with the adhesion measurements. Chromium did not react extensively with the substrate during deposition, but it did react with the silicon oxynitride surface layer formed during prefiring. On the other hand, Ti reduced the silicon nitride during deposition to produce TiN and free Si. Above 500°C the free silicon reacted with additional Ti at the Ti/TiN interface to form a silicide. (15 refs.)

108243 Method of studying viscoelastic properties of porous polymer films. V.E.Savchenko (Ivanovo Sci.-Res. & Experimental-Engng. Inst. of Machine Design, USSR).
J. Eng. Phys. (USA), vol.43, no.5, p.1250-3 (Nov. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.5, p.784-7 (Nov. 1982). [received: Sept. 1983]
A method is proposed for studying the viscoelasticity of polymer films with the aid of a quartz resonator. Results are reported pertaining to thin copper films. (7 refs.)

108244 Determination of stresses in Si-SiO_2 and mechanically affected Si by EPR. W.Gehlhoff, K.H.Segsa (Zentrum fur Wissenschaftlichen Geratebau, Akad. der Wissenschaften, Berlin, Germany).
Phys. Status Solidi b (Germany), vol.118, no.2, p.703-12 (1 Aug. 1983).
The influence of stresses generated by roughening or oxidation of silicon samples on the EPR spectra of Fe^0 in silicon is investigated. Starting from previous calculations it is possible to explain the changes in the angular dependence of the spectra, and to determine the stress components in the SiO_2 film and in the Si surface affected by roughening. The stress values determined by the EPR analysis are compared with the results obtained by other methods. (32 refs.)

108245 X-ray determination of the surface compression force in the ion-doped layer in silicon. P.V.Petrashe, I.L.Shulpina (VNII Nauchpribor, Leningrad, USSR).
Phys. Status Solidi a (Germany), vol.78, no.2, p.K105-8 (16 Aug. 1983).
Carries out a quantitative analysis of the X-ray section topographs from the ion-doped silicon samples. The authors are concerned mainly with four types of point defects, namely vacancies with the surface density N_v, interstitial Si atoms with density N_i, interstitial B atoms with density N_{Bi}, and the substitutions of the Si atoms by B atoms with density N_{Bs}. (13 refs.)

108246 Deformation of epitaxial structures on the basis of GaAs in the process of their production. O.K.Gorodnichenko, V.A.Presnov, N.D.Vasilenko.
Phys. Status Solidi a (Germany), vol.78, no.2, p.K171-3 (16 Aug. 1983).
Investigates the mechanical properties of epitaxial $Al_xGa_{1-x}As$-GaAs, Ge-GaAs heterostructures, and GaAs homostructures being subjected to tension. The tests were carried out at a constant loading rate in the IMASh 20-75 apparatus with a modified chamber permitting to perform liquid-phase epitaxy in it. The layers were grown on flat polished samples of semiconducting GaAs having the shape of dumb-bells. (4 refs.)

108247 The anomalous strain resistor effect in $Bi_{2-x}Sb_xTe_3$ polycrystalline films. S.A.Azimov, Sh.B.Atakulov, T.Azimov, A.N.Shamsiddinov (State Pedagogical Inst., Fergana, USSR).
Solid State Commun. (USA), vol.47, no.4, p.275-8 (July 1983).
The structure, electrophysical and deformational properties of $(Bi,Sb)_2Te_3$ polycrystalline films with anomalous strain-sensitivity ($K \sim 10^4$) were investigated. The presence of empty interleaves between conductive regions crossing current lines was established. An account of the peculiarities of temperature dependence of electrophysical parameters allowed the authors to come to a conclusion that charge carrier transfer in films occurred by tunneling across interleaves. The high films' strain-sensitivity was stipulated by modulation of thickness of empty interleaves (correspondingly to transparency of tunnel barrier) at uniaxial deformation. (13 refs.)

108248 Features of longitudinal flow of cellulose acetate films in active media. A.K.Evseev, Yu.N.Panov, S.Ya.Frenkel'.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.8, p.1638-42 (Aug. 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
The behaviour of cellulose acetate films preliminary oriented in ethanol during uniaxial stretching in water-phenol mixture has been studied for the regime of constant stress and constant force in the 40-60° temperature range. The analysis of the flow curves permits one to explain the observed regularities in terms of 'negative longitudinal viscosity'. The internal source of this viscosity is apparently the mesophase formed in material. A direct rheological method of measuring 'negative longitudinal viscosity' is proposed. (5 refs.)

68.70 WHISKERS AND DENDRITES: GROWTH, STRUCTURE, AND NONELECTRONIC PROPERTIES

108249 Whisker growth and cone formation on metal surfaces under ion bombardment. G.K.Wehner (Electrical Engng. Dept., Univ. of Minnesota, Minneapolis, MN, USA).
Appl. Phys. Lett. (USA), vol.43, no.4, p.366-7 (15 Aug. 1983).
The author was able to show experimentally that the seed metals which can cause cone development on ion bombarded metal targets need not to have a lower sputtering yield as widely believed but a higher melting point. By lowering the bombarding ion energy to near sputtering threshold values (<100 eV) one observes the growth of genuine single crystal whiskers which

point in all directions not related to the direction of ion incidence. The author is now convinced that (intentional or unintentional) seed cones are the result of an interplay among whisker growth, surface movement of atoms, and the effects of sputtering. (3 refs.)

108250 Influence of impurities on the growth of tin whiskers. R.Kawanaka (Kitaitami Works, Mitsubishi Electric Corp., Hyogo, Japan), K.Fujiwara, S.Nango, T.Hasegawa.
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.917-22 (June 1983).
Observations by micro Auger electron spectroscopy and X-ray micro analysis have been made on tin films electroplated on substrates of brass or zinc-coated copper, and on whiskers grown on the films. Direct experimental evidence has shown the existence of zinc and oxygen atoms on the surfaces both of the whiskers and the films. Copper atoms have also been detected in the whiskers and the films. A mechanism for the whisker growth is proposed, based on these experimental results. After electroplating, zinc atoms migrate onto the tin surface and bind there with oxygen atoms. At this stage, the nuclei of whiskers are formed, and the whiskers begin to grow with the aid of the internal stresses caused by the recrystallization of tin grains and/or the formation of intermetallic compounds of tin with copper. (23 refs.)

108251 Growth of whisker crystals of silver azide and lead azide. F.I.Ivanov, L.B.Zuev, M.A.Lukin, V.D.Mal'tsev (Siberian Metall. Inst., USSR).
Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.113-14 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.194-5 (Jan.-Feb. 1983). [received: Sept. 1983]
Discusses ways of obtaining acicular (whisker) crystals (AC) of lead and silver azides, very perfect from the viewpoint of various physicochemical properties, and consider the mechanism of their growth. Silver and lead azides attract attention not only as initiator explosives but also as model compounds with clearly marked semiconducting properties, suitable for the study of the mechanisms of topochemical reactions. In view of the fact that silver azide AgN_3 and lead azide PbN_6 are incongruent compounds, to obtain AC the authors used evaporation of solvent and crystallization by chemical reaction with oppositely directed diffusion of the substances. (10 refs.)

68.90 OTHER TOPICS IN THE STRUCTURE AND NONELECTRONIC PROPERTIES OF SURFACES AND THIN FILMS

108252 On two methods of calculation of the force of sticking of an elastic sphere to a rigid plane. V.M.Muller, B.V.Derjaguin, Yu.P.Toporov (Dept. of Surface Phenomena, Acad. of Sci., Moscow, USSR).
Colloids & Surf. (Netherlands), vol.7, no.3, p.251-9 (Aug. 1983).
Two methods for calculating the force of the adhesion of an elastic sphere with a rigid plane are considered, under conditions where the surface profile of the deformed sphere under the effect of a normal load and surface forces is very similar to that described by Hertz theory. The first method is based on the calculation of the first derivative of the total energy of the adhesive interaction; the second method is based on summing up the interactions outside the zone of direct contact of the deformable sphere with the right plane. The origin of discrepancy in the results obtained by the two aforesaid methods are indicated. The maximum adhesion forces proves to be equal to the force of interaction of the undeformed sphere with the substrate for the two approaches and within the approximation employed independent of the method of calculation. 108253 Approximate Green function for a semi-infinite solid with varying properties. R.Englman (Soreq Nuclear Res. Centre, Israel Atomic Energy Comm., Yavne, Israel).
J. Phys. A (GB), vol.16, no.13, p.2939-42 (11 Sept. 1983).
An expression is derived for the spatially dependent Green function or response function in a solid occupying a half-space and having generally varying properties. The expression is valid in the same range as the WKB approximation, namely for slowly varying properties. Some generalisation is indicated and the time-dependent Green function or the resolvent is obtained as a Fourier transform. (11 refs.)

71.00 ELECTRON STATES

(see also 63. Lattice dynamics, 73. Surfaces, interfaces, and thin films)

71.10 GENERAL THEORIES AND COMPUTATIONAL TECHNIQUES

108254 APW approach to the momentum matrix element calculation. I.I.Gegusin, V.N.Datsyuk (Inst. of Phys., Rostov State Univ., Rostov, USSR).
Phys. Status Solidi b (Germany), vol.118, no.2, p.K121-4 (1 Aug. 1983).
The direct interband transitions model is often used for the description of the optical properties of solids. This model requires the calculation of the momentum matrix elements $\vec{p}_{if}(\vec{k})$ (MME) between the initial and final Bloch states. The authors report new formulae for the MME calculation. Their version includes no summation over the magnetic quantum number and therefore leads to much faster computations. They briefly describe the main stages of the formula derivation. (8 refs.)

108255 Quasi-particle motion in a dichotomous stochastic potential: comparison of a decoupling approach with the dynamic CPA. U.Behn (Sektion Phys., Karl-Marx-Univ. Leipzig, Leipzig, Germany).
Phys. Status Solidi b (Germany), vol.118, no.2, p.K151-3 (1 Aug. 1983).
The motion of a tight-binding quasi-particle in a dichotomous stochastic time dependent potential is considered. The author shows that the decoupling approach, although interpolating between band limit (BL, $U=0$) and atomic limit (AL, bandwidth $2\Delta=0$) fails to reproduce the static limit (SL, $\alpha=0$) in contrast to the dynamical CPA which interpolates between the above limit cases correctly. For α not too small, however, in both approaches the density of states (DOS) shows the same qualitative behaviour and the solutions of the self-consistency condition in the dynamic approximation for the Hubbard model differ only slightly. (6 refs.)

108256 Electronic states for incommensurate lattice potentials. D.Weaire, J.P.Kermode (Dept. of Phys., Univ. Coll., Dublin, Ireland).
Phys. Status Solidi b (Germany), vol.118, no.2, p.K163-6 (1 Aug. 1983).
Dy and Ma (J. Phys. C, vol.15, p.6971, 1982) have recently presented a number of results for the electronic states of a one-dimensional Hamiltonian of the following form, where q is an irrational multiple of π: $H_{n,n}=V_0 \cos(qn)$, $H_{n,n+1}=H_{n+1,n}=1$, and $H_{n,m}=0$ otherwise. The authors point out that all of the detailed structure which Dy and Ma found in the local density of states may be simply interpreted. The authors shall concentrate on the case $q=3$, and preceed to approximate this by $2\pi(21/44)$, corresponding to the familiar estimate $\pi\approx 22/7$. This defines a periodic Hamiltonian with a primitive cell consisting of 44 lattice sites n. The authors find its band structure by use of Bloch's theorem and standard numerical methods. (2 refs.)

71.20 ELECTRONIC DENSITY OF STATES DETERMINATIONS

(inc. energy states of liquid semiconductors; see also 65.40 Lattice and electronic heat capacity)

108257 Exact electronic spectra and inverse localization lengths in one-dimensional random sysems. I. Random alloy, liquid metal and liquid alloy. T.M.Nieuwenhuizen (Inst. for Theoretical Phys., Univ. of Utrecht, Utrecht, Netherlands).
Physica A (Netherlands), vol.120A, no.1-2, p.468-514 (1983).
Analytic continuations into the complex energy plane of Dyson-Schmidt type of equations for the calculation of the density of states are constructed for a random alloy model, a liquid metal and for a liquid alloy. In all these models the characteristic function follows from the solution of this equation. Its imaginary part yields the accumulated density of states and its real part is a measure for the inverse of the localization length of the eigenfunctions. (28 refs.)

108258 Effects of order on the electronic structure of Ni_3Fe. S.Lipinski (Inst. of Molecular Phys., Polish Acad. of Sci., Poznan, Poland).
Phys. Status Solidi b (Germany), vol.118, no.2, p.861-9 (1 Aug. 1983).
The electronic densities of states for partially ordered Ni_3Fe are calculated within the framework of the Hartree-Fock and coherent potential approximations. The four-sublattices Hubbard model with an ansatz simplifying the hopping part of the Hamiltonian is used. (14 refs.)

108259 Partial LCAO densities of states for ScN, TiN, ZrN and ScP. R.Eibler, M.Dorrer, A.Neckel (Inst. fur Physikalische Chem., Univ. Wien, Wien, Austria).
Theor. Chim. Acta (Germany), vol.63, no.2, p.133-41 (1983).
Densities of states (DOS) and partial densities of states were calculated from self-consistent APW band structure calculations for four transition metal compounds (ScN, TiN, ZrN and ScP) using a recently published improved LCAO interpolation scheme. The total DOS and the LCAO non local partial metal *s*, *p* and *d* and non-metal *s* and *p* DOS of these compounds are presented and compared with non local LCAO partial DOS from earlier calculations as well as with local partial DOS obtained directly from the APW or LAPW wave functions. A LCAO charge analysis for all valence states and for the individual valence bands is also given. (10 refs.)

71.25 NONLOCALIZED SINGLE-PARTICLE ELECTRONIC STATES

108260 Fermi levels in electrolytes and the absolute scale of redox potentials. H.Gerischer, W.Ekardt (Fritz-Haber-Inst., Max-Planck-Gesellschaft, Berlin, Germany).
Appl. Phys. Lett. (USA), vol.43, no.4, p.393-5 (15 Aug. 1983).
Based on the correlation between the work function and the Fermi level of electrons in a single phase, Fermi levels in electrolytes are defined. With the vacuum level above the electrolyte as the reference state, an absolute scale of redox potentials can be derived. It is outlined how such data can be obtained experimentally. (12 refs.)

71.25C Techniques of band-structure calculation (general theory, applications of group theory, analytic continuation, etc)

108261 Band structure calculations in N-ary alloys. A.A.Mbaye (Lab. de Phys. du Solide et Energie Solaire, CNRS, Valbonne, France), F.Aymerich.
J. Phys. (France), vol.44, no.9, p.1085-93 (Sept. 1983).
A method for simple calculations of the electronic structure of complex crystalline alloys is presented. This method is twostepwise: within the virtual crystal approximation (VCA) a general interpolation scheme is achieved for the determination of the physical properties of the alloy in terms of those of its pure constituents and the intrinsic (VCA) bowing effects of their related simplest (pseudobinary) alloys. The second step of this method is an extension of the Dielectric Method to account for disorder effects in the general alloy, including a **k** dependent parameterization of the extrinsic bowing effects. Applied to the III-V compound-based materials, the general expressions of lattice parameter and higher symmetry points optical transitions as functions of compositions are derived for these isovalent and quaternary alloys. 71.25H Measurement of Fermi surface parameters

(inc. dHvA, magnetoacoustic, position annihilation, and cyclotron resonance studies, etc.)

108262 The de Haas-van Alphen effect and anisotropy of the magnetic susceptibility in Zn-Ag and Zn-Ga dilute alloys. Y.Saito (Faculty of Sci., Toyama Univ., Toyama, Japan), K.Mori, Y.Yosida.
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2820-6 (Aug. 1983).
The authors report the results of measurements of the de Haas-van Alphen effect and the anisotropy of the magnetic susceptibility associated with the needle Fermi surface in the 3rd-band of pure zinc, dilute Zn-Ag and Zn-Ga alloys. The cross-sectional area of the needles increases for silver impurity, and decreases for gallium impurity. A large maximum in the temperature dependence of the anisotropy of the magnetic susceptibility is observed in pure zinc, Zn-Ag and Zn-Ga alloys. The temperature indicating its maximum increases in Zn-Ag and decreases in Zn-Ga alloys. These results of the magnetic susceptibility and the changes in the cross-sectional area of the needs with alloying can be reasonably accounted by temperature and impurity dependence of axial ratios.

71.25J Effective mass and g-factors

108263 Molybdenum hole octahedron and hole ellopsoid cyclotron effective mass calculation. M.Surma, G.Musial (Inst. of Phys., A. Mickiewicz Univ., Poznan, Poland).
Acta Phys. Pol. A (Poland), vol.A64, no.2, p.207-14 (Aug. 1983).
The cyclotron effective mass of carriers on the hole-ellipsoid and hole-octahedron Fermi surface of molybdenum is calculated. Calculations are performed on the assumption of the well known equation $m^*(k_z)=(\hbar^2/2\pi)(\partial S(k_z)/\partial\epsilon)$. The authors write the latter in the form with $\partial S(k_z)/\partial\epsilon=[\partial S(k_z)/\partial k_z](\partial\epsilon/\partial k_z)^{-1}$ and calculate $m^*(k_z)$ directly from the data of $\partial S(k_z)/\partial k_z$ for the hole-ellipsoid and also for the hole-octahedron. The cyclotron effective mass of the hole on the ellopsoid and octahedron is confirmed by experimental results. (6 refs.)

71.25L Electron energy states in liquid metals

108264 Electronic states in liquid metals and amorphous solids: a functional approach. L.Dagens (CEA, Centre d'Etudes de Limeil, Villeneuve St. Georges, France).
J. Phys. F (GB), vol.13, no.9, p.1833-46 (Sept. 1983).
The powerful functional formulation used in quantum field theory and statistical physics is extended to deal with electronic properties of liquid metals and disordered semiconductors. The averaged one-electron Green operator is extended to a functional $G|\eta|$ of a position-dependent ionic number density η_R. Functional equations are derived for the purely random case and for the correlated-ion case, within a generalised Kirkwood superposition approximation (GKSA), which treats exactly the ionic correlations of n ions up to $n=\nu$ ($\nu=2$ is the ordinary KSA; $\nu=3$ involves the exact two-ion and three-ion distribution functions, etc). The functional equation for the site-site scattering operator is reduced formally to ordinary integral equations by introducing vertex operators. An approximation is derived which extends the effective medium approximation (EMA) beyond the KSA. The functional formulation provides various exact identities which are used to derive internal consistency relations for approximations such as the EMA and to formulate a general identity related to the non-overlapping condition. (15 refs.)

71.25M Electron energy states in amorphous and glassy solids

108265 Experimental evidence for a structure-induced mininum of the density of states at the Fermi energy in amorphous alloys. P.Haussler, F.Baumann (Phys. Inst., Univ. Karlsruhe, Karlsruhe, Germany), J.Krieg, G.Indlekofer, P.Oelhafen, H.-J.Guntherodt.
Phys. Rev. Lett. (USA), vol.51, no.8, p.714-17 (22 Aug. 1983).
First photoemission spectra are reported for the valence bands and core levels of quench-condensed Au_xSn_{100-x} ($0\leq x\leq 100$) films in the amorphous and the crystalline state. It is found that (1) the valence-band spectra for the $20\leq x\leq 80$ region, measured just after condensation, exhibit a decrease in intensity towards the Fermi energy E_F which can be understood in terms of a minimum in the density of states near E_F and (2) the minimum near E_F is most pronounced at an alloy concentration where the highest stability for the amorphous phase has been found. (13 refs.)

108266 Theory of the interaction between electrons and the two-level system in amorphous metals. I. Noncommutative model Hamiltonian and scaling of first order. K.Vladar (Central Res. Inst. for Phys., Budapest, Hungary), A.Zawadowski.
Phys. Rev. B (USA), vol.28, no.3, p.1564-81 (1 Aug. 1983).
The general form of the interaction between tunneling two-level systems (TLS) and conduction electrons is discussed for metallic glasses. The particular form of the Hamiltonian is given in the case where only a single atom tunnels between two positions. There are two couplings correspopding to the two basic scattering processes. In the first one, the tunneling atom does not change position; the second process is the conduction-electron-assisted tunneling process. The two coupling parameters are estimated. The difference in the angular dependence of these couplings on the directions of the incoming and of the outgoing electrons is responsible for the appearance of logarithmic corrections in the scattering amplitude. Scaling equations are derived for the couplings in terms of changing the bandwidth cutoff. It is shown that the scaling equations lead to especially strong coupling in two conduction-electron scattering channels which are linear combinations of the *s*-, *p*-, and *d*-like spherical wave functions. The Hamiltonian scales to a spin $S={}^1/_2$ antiferromagnetic Kondo Hamiltonian, which indicates the formation of a 'bound state', where the motions of the tunneling atom and of the conduction-electron screening cloud around the TLS are strongly correlated; thus the Friedel oscillations follow the tunneling atom. The crossover temperature, below which the correlation becomes especially strong, is determined in the leading logarithmic approximation. (36 refs.)

108267 Theory of the interaction between electrons and the two-level system in amorphous metals. II. Second-order scaling equations. K.Vladar (Central Res. Inst. for Phys., Budapest, Hungary), A.Zawadowski.
Phys. Rev. B (USA), vol.28, no.3, p.1582-95 (1 Aug. 1983).
For pt.I see ibid., vol.28, no.3, p.1564 (1983). A general Hamiltonian for the interaction between conduction electrons and the two-level system is considered. Renormalization-group equations of second order are constructed with the use of the multiplicative renormalization-group technique. The mass renormalization is treated in detail to determine the effect of screening by conduction electrons on the energy splitting E. The crossover temperature $T_K=D(v^xv^z)^{1/2}(v^x/4v^z)^{1/4A}$, where $A=v^z$, between the weak and strong coupling regions is determined, and it is reduced by 2 orders of magnitude compared to the expression obtained in first-order scaling. The scaled values of the couplings are calculated analytically. In the crossover region the off-diagonal couplings are $v^x\sim v^y\sim{}^1/_8$. The crossover temperature can be found in the region of physical interest ($T_K>1K$) if the initial diagonal coupling $v^z>0.2$. In this case, the energy splitting calculated is reduced by more than 2 orders of magnitude. That reduction results in a large enhancement in the distribution of the energy splitting at the low-energy side. The position of the lower end of the scaling region is discussed where scaling in terms of temperature is hindered by the energy splitting. (19 refs.)

108268 Theory of the interaction between electrons and the two-level system in amorphous metals. III. Experimentally observable quantities. K.Vladar (Central Res. Inst. for Phys., Budapest, Hungary), A.Zawadowski.
Phys. Rev. B (USA), vol.28, no.3, p.1596-612 (1 Aug. 1983).
For pt.II see ibid., vol.28, no.3, p.1582 (1983). In the two immediately preceding papers a theory of interaction between electrons and two-level systems (TLS) has been developed. According to that theory, the electron scattering on the TLS is resonant scattering below a characteristic crossover temperature T_k. This resonant scattering contributes to the lifetime T_1 of the TLS due to a Korringa-type mechanism. The relaxation time T_1 has been calculated by using the renormalized enhanced-coupling constants. Making use of the different ultrasound experimental data, the authors have given the effective coupling strengths for different alloys. The average coupling is small in PdCuSi and NiP alloys to form a resonant state. For PdZr and NbZr alloys, however, the averaged coupling strengths are too small—only by less than a factor of 2—to have a resonant state. Thus in these alloys a portion of the TLS may have sufficiently large coupling to have resonant scattering if a distribution for the coupling is assumed. The electrical resistivity, as a function of temperature, is calculated. At the crossover temperature a logarithmic temperature dependence with a negative coefficient is found for one decade of the temperature. At lower temperature a crossover between the logarithmic and Fermi-liquid-type behaviors is suggested. It has been suggested that an enhanced density of state may be due to the renormalization (reduction) of the energy splitting of the TLS. That enhancement is necessary to explain the amplitude of the resistivity maximum at $T=0$ if only a small portion of the TLS has sufficiently large coupling to form the resonant state. Finally, the inelastic inverse scattering lifetime τ_{in} for conduction electrons is calculated. (42 refs.)

71.25P Band structure of crystalline metals

108269 Electronic band structure, Fermi surface and optical properties of hexagonal yttrium. N.I.Kulikov, E.T.Kulatov.
Fiz. Nizk. Temp. (USSR), vol.9, no.8, p.823-31 (Aug. 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
By using a linearized KKR method the band structure of HCP yttrium was calculated. Self-consistency for the crystal potential was made in the framework of the local density approximation for the density functional formalism (Hedin-Lundkvist potential). Density of states, joint density of states and cross-sections of the Fermi surface were calculated and comparison with the experimental data was performed. The coincidence between theory and experiment is satisfactory. The results of computation are used for the interpretation of optical measurements. In addition, the explanation for unavailable magnetic order and superconductivity in this metal is given. (21 refs.)

108270 Weak itinerant ferromagnets: Ni_3Al. J.J.M.Buiting, J.Kubler, F.M.Mueller (Res. Inst. for Materials, Nijmegen, Netherlands).
J. Phys. F (GB), vol.13, no.9, p.L179-83 (Sept. 1983).
The electronic band structure of Ni_3Al has been calculated using the ASW method, and a high-precision density of states has been derived. Comparison with existing specific-heat measurements data suggests that Ni_3Al remains in the fluctuation regime even in the ferromagnetic state. The authors present calculations of the extremal cross-sectional areas of the Fermi surface and the corresponding orbital masses to stimulate further experiments. (15 refs.)

108271 Electron-electron interaction in 3d metals which b.c.c. structure. F.Sacchetti (Istituto di Fisica, Univ. di Perugia, Perugia, Italy).
J. Phys. F (GB), vol.13, no.9, p.1801-6 (Sept. 1983).
The calculation of the electronic states lifetime and of the enhancement factor of the electronic specific heat related to the electron-electron interaction is presented in the case of the 3d metals V, Cr, Mn and Fe with b.c.c. structure. The average lifetime of the electronic states has been found to be simply related to the interstitial electron density while no simple behaviour has been found for the enhancement factor. (22 refs.)

108272 de Haas-van Alphen effect study of electronic structures of niobium-based molybdenum alloys. H.Aoki, K.Ogawa (Nat. Res. Inst. for Metals, Tokyo, Japan).
J. Phys. F (GB), vol.13, no.9, p.1821-31 (Sept. 1983).
The electronic structures of dilute niobium-based molybdenum alloys have been studied by using the de Haas-van Alphen effect. The rate of increase of the Dingle temperature (ΔT_D*) on alloying is found to be fairly small compared with that of noble-metal alloys and to be anisotropic over the Fermi surfaces that is, 3K (at.% Mo)$^{-1}$ for ν oscillations arising from the ellipsoids, and 7K (at.% Mo)$^{-1}$ for α and η oscillations arising from the jungle gym. The change in frequency of the ν_{3456} oscillation is about $^2/_3$ that predicted by the rigid band model. Applying the partial-wave analysis to these experimental facts, the following results are obtained. (i) The d wave phase shift dominates over s, p and f wave phase shifts in this alloy system and the anisotropy in ΔT_D* results from the anisotropy in the amount of d component of the wavefunction over the Fermi surfaces. (ii) The non-rigid band-like behaviour of the ν_{3456} oscillation arises from the same origin as ΔT_D*. (iii) The significantly small ΔT_D* found in the present experiment is related to a small electron group velocity on the Fermi surfaces in niobium. (34 refs.)

108273 A theory of the electronic structure in metallic spin-glass alloys: Ag_cMn_{1-c}. M.C.Munoz, B.L.Gyorffy (H.H. Wills Phys. Lab., Univ. of Bristol, Bristol, England), K.Verhuyck.
J. Phys. F (GB), vol.13, no.9, p.1847-67 (Sept. 1983).
The authors present a first-principles description of the electronic structure in metallic spin-glass alloys. The method is illustrated by explicit calculations for the Ag_cMn_{1-c} system. In this case it consists of a Korringa-Kohn-Rostoker coherent potential approximation (KKR CPA) calculation for a three-component alloy. Namely, the lattice sites are taken to be occupied by Ag atoms with probability c, Mn atoms with local moments pointing 'up', $Mn\uparrow$, with probability $^1/_2(1-c)$ and Mn atoms with the opposite orientation, $Mn\downarrow$, with the same probability $^1/_2(1-c)$. They find that the Mn impurity band is exchange split, as in spin-polarised band theory with aligned spins, and the resulting gain in energy supports the moments. In this sense their theory is a generalisation of the Anderson model of impurity moment formation to finite concentrations. They study the density of states, Bloch spectral functions and the Fermi surface. (50 refs.)

108274 The electronic structure of non-stoichiometric Pd-rich Pd-Ag hydrides. W.M.Temmerman (Sci. & Engng., Res. Council, Daresbury Lab., Daresbury, England), A.J.Pindor.
J. Phys. F (GB), vol.13, no.9, p.1869-84 (Sept. 1983).
The authors analyse in detail the KKR CPA calculations of Pindor et al. (1983) on the electronic structure of a series of non-stoichiometric Pd-rich Pd-Ag hydrides. The authors find the hydrogen-metal bonding band split off the bottom of the metal d bands for all H concentrations. They study the electronic structure at high symmetry points and along the ΓL direction, and in particular they find two $L_{2'}$ states. They comment on the relationship of their results to the stability of hydride formation. (17 refs.)

108275 Self-energy contributions to the band structure of alkali metals: application to potassium. M.Schreiber, H.Bross (Sektion Phys., Univ. Munchen, Munchen, Germany).
J. Phys. F (GB), vol.13, no.9, p.1895-914 (Sept. 1983).
Starting from the realistic wavefunctions of Faust et al. (1976) the authors have calculated the electron self-energy Σ and corresponding corrections to the band energies of potassium in Hedin's GW approximation. The inverse dielectric function (DEF) was evaluated in the plasmon pole approximation (PPA) using a biquadratic dispersion law. The dynamical effects, i.e. the energy dependence of Σ in the quasiparticle equation, were taken into account fully self-consistently, showing significant shifts with respect to the usual first-order calculations. They found the expected reduction of self-energy contributions as compared with the static approximation from which they started. Moreover, the core polarisation could be included in a consistent way, yielding better agreement with experimental data. (40 refs.)

108276 Filling of the 3d band of the manganese in $GdAl_{2-x}Mn_x$ for $x<0.2$. A.Slebarski, K.Kaczmarska, E.Kwapulinska (Inst. of Phys., Silesian Univ., Katowice, Poland).
J. Magn. & Magn. Mater. (Netherlands), vol.38, no.1, p.51-6 (Aug. 1983).
X-ray, magnetic, electrical sensitivity and ESR studies of $GdAl_{2-x}Mn_x$ compounds were performed. The transition temperatures, effective mass, thermal broadening of resonance linewidth and g-factors were obtained. For low concentration of $GdMn_2$ in $GdAl_2$ up to 20%, Mn is nonmagnetic. Increasing of the effective mass and the thermal broadening linewidth ESR with increasing x can be explained by the presence of d-electrons. (13 refs.)

108277 Application of special-directions method to the optical properties of copper and silver. A.K.Ahuja, S.Auluck, S.K.Joshi (Dept. of Phys., Univ. of Roorkee, Roorkee, India).
Phys. Status Solidi b (Germany), vol.118, no.2, p.575-86 (1 Aug. 1983).
Using the interpolation scheme (with four OPWs) the density of states $N(E)$, joint density of states JDOS(E), and the frequency dependent dielectric function $\epsilon_2(\omega)$ for copper (non-relativistic) and silver (relativistic) are calculated. The summation over the k-vectors lying in the first Brillouin zone are performed using the special directions (SD) method. The effect of increasing the number of SDs is investigated. The optical matrix elements are evaluated by a method given by Smith (1979). The effect of including a relaxation time τ on $\epsilon_2(\omega)$ is studied. Also a calculation of $\epsilon_2(\omega)$ for copper including 16 OPWs in the interpolation scheme is given and found that the agreement with experimental results is improved at the higher energies by increasing the number of OPWs in the interpolation scheme. (27 refs.)

108278 Angle-resolved photoemission and band structure of copper. R.Courths, B.Cord, H.Wern, S.Hufner (Fachbereich Phys., Univ. of Saarland, Saarbrucken, Germany).
Phys. Scr. (Sweden), vol.T4, p.144-7 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).
The triangulation method, the appearance angle method and for the first time the surface emission method have been used for the determination of the electronic band structure of copper along the [001], [110] and [111] direction from ARPES spectra taken on the (110) and (111) faces. The experimentally derived bands are compared with first-principles calculations. For the bands up to energies of 20 eV above the Fermi energies it is found that Burdick's band calculation is in good agreement with experiment. Together with published normal emission data an almost complete experimental band structure below the Fermi energy is derived which clearly shows the spin-orbit splitting of the d-bands. (19 refs.)

108279 Method for band structure determination from angle-dispersed photoemission data: application to Ni. H.Martensson, P.-O.Nilsson (Dept. of Phys., Chalmers Univ. of Technol., Goteborg, Sweden).
Phys. Scr. (Sweden), vol.T4, p.152-4 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).
The authors have performed a least-square fit of a Hodges-Ehrenreich-Lang interpolation scheme to experimentally determine initial-states of Ni from different kinds of measurements. From the band structure obtained in this way, structure plots (energy vs. emission angle) for mirror-plane emission from low-index Ni surfaces have been made. These structure plots are based on free-electronlike final-state dispersion, but by allowing the final-state to have a certain width it is possible to find structures that are rather independent of the final-state dispersion. Using the corresponding measured structures for a refined fit of the interpolation scheme parameters, the authors have got a semi-empirical band structure for Ni giving a good overall agreement with the measured angle-dispersed spectra. It is also shown how the structure plots can be used to determine the accuracy of energy-coincidence measurements. (14 refs.)

108280 Electronic structure of anisotropic semiconductors: optical properties and behaviour under hydrostatic pressure. H.M.Isomaki (Dept. of General Sci., Helsinki Univ. of Technol., Espoo, Finland).
Acta Polytech. Scand. Electr. Eng. Ser. (Finland), no.EL51, p.2-15 (1983).
The results of investigations into the electronic properties of trigonal Se and Te and hexagonal TiS_2, $TiSe_2$, ZrS_2 and $ZrSe_2$ are summarised. The ab initio energy bands are obtained with the use of the self-consistent orthogonalised-plane-wave (OPW) method. The permittivity, reflectivity, absorption coefficient and electron-energy-loss function are calculated for Se, Te, ZrS_2 and $ZrSe_2$ with the use of the rigorously evaluated momentum matrix elements. The local-field effects are estimated to be small which contradicts the recent model studies for Se and Te. (no refs.)

108281 Plasmon approach to the average energy gap of Mg, Ca and Sr compounds. V.K.Srivastava, A.R.Chetal (Dept. of Phys. & Math., Indian School of Mines, Dhanbad, India).
Nuovo Cimento D (Italy), vol.2D, ser.1, no.4, p.1014-18 (July-Aug. 1983).
The average energy gap of magnesium, calcium and strontium compounds has been calculated by using the plasma oscillation theory of solids. The calculated values are in fair agreement with the observed values and the values calculated by different workers. The authors' calculations are not restricted to simple binary and ternary compounds but can also be successfully applied to all types of compounds. (21 refs.)

108282 Energy spectrum of Bi_2Te_2Se. R.S.Erofeev, E.I.Shcherbina.
Inorg. Mater. (USA), vol.18, no.11, p.1546-50 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1802-6 (Nov. 1982).
Analysis of the electron states indicates that Bi_2Te_2Se alloys are not completely ordered. The amount of Te atoms in the central chalcogen layer may be as much as 30%. Bi_2Te_2Se should show electron conduction, while the

electron concentration and the effective mass are definitely dependent on the degree of ordering, as is confirmed by experiment. (7 refs.)

108283 Indirect interband transitions in $Ga_{1-y}In_yP_{1-x}As_x$. G.F.Smirnova (Minsk Radio-Engng. Inst., Minsk, Belorussian SSR).
Inorg. Mater. (USA), vol.18, no.9, p.1252-5 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1468-70 (Sept. 1982). [received: Sept. 1983]
An equation has been obtained for calculating the indirect forbidden band width of $Ga_{1-y}In_yP_{1-x}As_x$ solid solutions of any composition. Criteria have been proposed for determining the type of the band structure of these solid solutions. (7 refs.)

108284 Theoretical study of lattice instability and lattice dynamics of 2H-TaSe$_2$ and 2H-NbSe$_2$. I. Electron Interaction and generalized electronic susceptibility. K.Motizuki, E.Ando (Dept. of Material Phys., Osaka Univ., Toyonaka, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2849-57 (Aug. 1983).
Lattice instability of $2H$-TaSe$_2$ and $2H$-NbSe$_2$ is studied on the basis of the electronic band structure of these compounds obtained by a tight-binding fit to Mattheiss' (1973) band calculation. The wave number and mode dependences of the electron-lattice coupling matrix and the generalized electronic susceptibility are calculated. The results are discussed in connection with the lattice instability. (32 refs.)

108285 Metastable electron states in doped alloys $Pb_{1-x}Sn_xTe$. B.A.Akimov, N.B.Brandt, L.I.Ryabova (Dept. of Low Temperature Phys., Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.6, p.12-18 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.6, p.12-18 (1982).
The authors present the results of an investigation of nonequilibrium states and long-lived relaxation processes which occur in doped alloys $Pb_{1-x}Sn_xTe$ at temperatures $T \lesssim 20K$ when the system is brought out of equilibrium by a quantizing magnetic field, IR illumination, or by a strong electric field. The results obtained indicate that the energy spectrum of the alloys studied contain metastable electron states. (4 refs.)

108286 Renormalized atom model (RAM) applied to the heavy rare-earth sesquioxides in cubic crystal structure. F.Lopez-Aguilar, J.Costa-Quintana (Dept. de Electricidad y Electronica, Univ. Autonoma de Barcelona, Barcelona, Spain).
Phys. Status Solidi b (Germany), vol.118, no.2, p.779-87 (1 Aug. 1983).
The electronic structure of the b.c.c. heavy rare-earth sesquioxides is analyzed through the single-site solutions within the renormalized atom model (RAM) and using the relativistic version. The Coulomb correlation energy is calculated in order to determine the unoccupied 4f levels. (35 refs.)

108287 Semirelativistic SCF-SW-Xα calculations of uranium compounds. Electronic structure and chemical bond. V.Heera, G.Seifert, P.Ziesche (Sektion Phys., Tech. Univ. Dresden, Wissenschaftsbereich Theoretische Phys., Dresden, Germany).
Phys. Status Solidi b (Germany), vol.118, no.2, p.K107-12 (1 Aug. 1983).
The authors carried out semirelativistic SCF-SW-Xα calculations of clusters which are representative for bulk materials UO$_2$, α-UO$_3$, and UC. In their semirelativistic approach they consider relativistic corrections, neglecting the spin-orbit interactions, via semirelativistic t_l^{-1} in the scattered wave secular equations. However, they obtain semirelativistic t_l^{-1} from semirelativistic wave functions $P_l(r)$ by averaging the major components of the solution of the Dirac equation within the atomic sphere. (20 refs.)

108288 The electronic structure of CeO$_2$ and PrO$_2$. D.D.Koelling (Argonne Nat. Lab., Argonne, IL, USA), A.M.Boring, J.H.Wood.
Solid State Commun. (USA), vol.47, no.4, p.227-32 (July 1983).
The authors have determined the electronic structure of CeO$_2$ and PrO$_2$ by performing SCF band calculations. They find that in both systems there are metal f- and d-electrons in the oxygen 2p bands. They discuss the question of valency and ionicity in these systems. (11 refs.)

108289 The nature of temperature dependence of energy gaps in layer semiconductors. G.L.Belenkii, E.Yu.Salaev, R.A.Suleimanov, N.A.Abdullaev (Inst. of Phys., Acad. of Sci., Baku, USSR).
Solid State Commun. (USA), vol.47, no.4, p.263-5 (July 1983).
The temperature dependences of direct and indirect energy gaps in layer semiconductors GaS, GaSe and GaS_xSe_{1-x} are investigated in the temperature range 5-150K. The nonmonotonous behaviour of $E_g(T)$ dependences is observed in these crystals. It is shown that the effect of thermal expansion cannot in itself explain the observed anomalies. A new model of electron-phonon interaction explaining the $E_g(T)$ behaviour in layer crystals is proposed. (16 refs.)

71.30 METAL-INSULATOR TRANSITIONS

108290 Electron localization in a magnetic semiconductor: $Gd_{3-x}\nu_xS_4$. S.von Molnar (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), A.Briggs, J.Flouquet, G.Remenyi.
Phys. Rev. Lett. (USA), vol.51, no.8, p.706-9 (22 Aug. 1983).
The metal-insulator transition in the magnetic semiconductor $Gd_{3-x}\nu_xS_4$, where ν stands for vacancies, has been studied by tuning through the transition with the application of a magnetic field at low temperatures. For two samples with $x=0.321$ and 0.325 the transition is continuous. $\sigma(T\rightarrow 0)$ is linear in H-H_c which implies that $\sigma(T\rightarrow 0)\propto(E\text{-}E_c)$, where H_c is a critical field and E_c is the mobility edge. This is consistent with new scaling theories of both localization and interaction effects. (20 refs.)

108291 Role of phonon-induced hybridization in the spinless Anderson model. J.Zielinski, J.Kowalska (Inst. of Phys., Silesian Univ., Katowice, Poland).
Phys. Status Solidi b (Germany), vol.118, no.2, p.805-10 (1 Aug. 1983).
The spinless Anderson model accomplished by phonon-induced hybridization is considered. It is found that in the periodic case an insulator-metal transition appears depending on the values of parameters and temperature. In the case of an isolated impurity a pronounced temperature dependence takes place leading to an increase of the virtual state width. (21 refs.)

108292 A note on some aspects of the disordered effect in the Mott-Hubbard transition. S.Nara (Inst. for Theoretical Phys., Univ. of Stuttgart, Stuttgart, Germany).
Physica B & C (Netherlands), vol.121B+C, no.1-2, p.169-74 (1983).
The Hubbard model is extended to include the effect of random atomic potentials and transfer integrals of electron. The density of states of quasiparticles is calculated with the use of Hubbard's third approximation for the electron correlation problem and the coherent potential approximation for the random problem (Shiba's method). The results suggest that the band gap due to the correlation effect in an insulator phase vanishes in the presence of a certain value of the randomness. However, this does not necessarily imply an insulator-to-metal transition which would be determined by the relative position of the mobility edge and the Fermi level. (13 refs.)

108293 Evidence for one-half charge-density-wave wavelength pinning periodicity in Peierls conductors. P.Monceau, M.Renard, J.Richard, M.C.Saint-Lager, H.Salva, Z.Z.Wang (Centre de Recherches sur les Tres Basses Temperatures, CNRS, Grenoble, France).
Phys. Rev. B (USA), vol.28, no.3, p.1646-8 (1 Aug. 1983).
It is shown that, for transition-metal trichalcogenides NbSe$_3$, for TaS$_3$ both with a monoclinic and an orthorhombic unit cell, and for transition-metal tetrachalcogenide (TaSe$_4$)$_2$I, compounds which exhibit transport properties associated with charge-density-wave motion, the linear relationship between the current carried by the charge-density wave and the fundamental frequency of the AC voltage detected in the nonlinear state leads to a pinning potential periodicity which is half the charge-density-wave wavelength in agreement with the recent theory of Josephson oscillations of Barnes and Zawadowski. (28 refs.)

108294 Formal Mott transition between the one dimensional conductor $K_{0.3}MoO_3$ and the highly anisotropic semiconductor $K_{0.33}MoO_3$. G.Travaglini, P.Wachter (Lab. fur Festkorperphys., ETH Honggerberg, Zurich, Switzerland).
Solid State Commun. (USA), vol.47, no.4, p.217-21 (July 1983).
The blue bronze $K_{0.3}MoO_3$ is well known to have a 1-D character along the crystallographic b axis. The red bronze $K_{0.33}MoO_3$, instead, is a semiconductor with a 0.5 eV energy gap. The two bronzes have a different crystallographic configuration. In a microscopic model one can derive the red bronze structure from the one of the blue bronze and one can explain the metal semiconductor 'transition' between $K_{0.3}MoO_3$ and $K_{0.33}MoO_3$ with a formal Mott transition of delocalized into localized states due to a critical overlap between cation-anion-cation orbitals. 71.35 EXCITONS AND RELATED PHENOMENA

(inc. electron-hole drops)

108295 Localization of excitonic eigenfunctions in isotopically mixed naphthalene crystals. J.P.Lemaistre, A.Blumen (Centre de Mecanique Ondulatoire Appliquee, Paris, France).
Chem. Phys. Lett. (Netherlands), vol.99, no.4, p.291-4 (12 Aug. 1983).
Presents numerical calculations for the localization of excitonic eigenfunctions in substitutionally disordered naphthalene crystals. The distribution of the localization indices is evaluated by considering the off-diagonal disorder due to short-ranged triplet interactions. The transition from molecular to crystal-like eigenfunctions occurs gradually as the trap concentration increases. (24 refs.)

108296 Polarization energy of a localized charge in a molecular crystal. VI. Effect of excitons. I.Eisenstein, R.W.Munn (Dept. of Chem., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England).
Chem. Phys. (Netherlands), vol.79, no.2, p.189-95 (1 Sept. 1983).
For pt.V see ibid., vol.77, p.47 (1983). The polarization energy of a localized charge carrier in a molecular crystal changes by ΔP near an exciton, viewed as a localized excited molecule of changed palarizability. Experimental polarizability changes in the first excited singlet state are used to calculate ΔP for various carrier and exciton positions in benzene, naphthalene, anthracene, and tetracene. As the excited-state polarizability is larger, ΔP is normally negative, with minima ranging from -12 meV in benzene to -83 meV in tetracene. The change in charge-quadrupole energy ΔW_Q is estimated for naphthalene using a theoretical quadrupole moment for the first triplet state. At most sites $|\Delta W_Q|>|\Delta P|$, but the sign of ΔW_Q varies. The net exciton interaction with electrons in naphthalene varies from -49 to $+45$ meV and with holes from -106 to $+29$ meV. This behaviour is broadly complementary to that previously calculated for vacancies. (23 refs.)

108297 Excitons in aluminium. M.S.Miller, H.D.Drew (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA).
J. Phys. F (GB), vol.13, no.9, p.1885-93 (Sept. 1983).
A nearly free electron description of the parallel bands responsible for the 1.6 eV absorption edge in aluminium gives rise to an inverse square-root singularity in the joint density of states. The authors have explored the possibility of excitons associated with the corresponding optical transitions. A calculation based on the Bethe-Salpeter equation with a statically screened Coulomb interaction between carriers shows that the singularity in the joint density of states leads to a singlet exciton with a binding energy of only 5 meV. For the case of a triplet exciton they estimate a binding energy of 20 meV. These results are discussed in relation to experiments. (16 refs.)

108298 Exciton solitons in one-dimensional molecular crystals. S.Takeno (Dept. of Phys., Kyoto Tech. Univ., Kyoto, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.6, p.1798-80 (June 1983).
Exciton solitons in one-dimensional molecular crystals arising from interactions with lattice vibrations are studied by taking kinematical interactions of excitons into account. The nonlinear Schrodinger equation follows from a nonlinear Klein-Gordon-type equation by the use of rotating-wave approximation. (13 refs.)

108299 Ionization of the direct-gap exciton in photoexcited germanium. H.Schweizer, A.Forchel, A.Hangleiter (Phys. Inst., Univ. Stuttgart, Stuttgart, Germany), S.Schmitt-Rink, J.P.Lowenau, H.Haug.
Phys. Rev. Lett. (USA), vol.51, no.8, p.698-701 (22 Aug. 1983).
The excitonic absorption at the direct gap in Ge is measured as a function of the density and temperature of excitations at the indirect gap. The spectra are analyzed by means of a many-body theory which is valid for arbitrary free-carrier densities. The critical densities for the ionization are determined for temperatures from 8.5 to 60K and compared with other predictions. (19 refs.)

108300 The influence of the variation of the chemical composition and of the nitrogen doping level on the energy spectra of the bound excitons in $GaAs_{1-x}P_x$:N. N.R.Nurtdinov, R.Stegmann, M.Griepentrog (Dept. of Phys., Moscow State Univ., Moscow, USSR).
Phys. Status Solidi b (Germany), vol.118, no.2, p.613-21 (1 Aug. 1983).
The spectras of photoluminescence (PL), photoexcitation (PE) and cathodoluminescence (CL) in $gaAs_{1-x}P_x$:N ($x \geq 0.67$) are investigated. The spectral position of the N_x-line can be described by a logarithmic dependence on the excitation level and on the nitrogen concentration. Different methods are worked out to determine the nitrogen concentration by measurements of PL, PE, and CL. The results allow assertions about the influence of the disorder in the As-P sublattice and of the interaction of the nitrogen atoms on the energy spectra of the bound excitons. (17 refs.)

108301 Exciton-enhanced double injection currents in tetracene crystals. J.Kalinowski, R.Signerski (Inst. of Phys., Tech. Univ., Gdansk, Poland).
Phys. Status Solidi b (Germany), vol.118, no.2, p.K147-50 (1 Aug. 1983).
Provides experimental evidence for the influence of triplet excitons on the I-V behaviour of double injection into single tetracene crystals in the dark and under illumination by highly absorbed light. The monotonic increase in the electroluminescence effect shows that the major part of the emission is the delayed electroluminescence and the monotonic decrease in the magnetic field effect on the current provides evidence that the triplet excitons and not singlets are responsible for the detrapping. This also suggests that in the case when light is used for exciton generation the main role in the detrapping is due to triplet excitons. (15 refs.)

108302 Removal of the degeneracy in the description of electron-hole-cloud configurations. J.S.Kirkaldy, L.R.B.Patterson (Dept. of Phys., McMaster Univ., Hamilton, Ontario, Canada).
Phys. Rev. A (USA), vol.28, no.3, p.1612-17 (Sept. 1983).
The prediction of the stable configuration of an ideal uniformly volume-pumped electron-hole cloud involves the rationalization of a 'free-boundary' problem. That is to say, there are an infinite number of degenerate steady-state solutions which satisfy the fluid-dynamical equations and the boundary conditions. If the stationary states are metastable due to isolation or freedom from large-scale fluctuations in the cloud, then all states are attainable via differing initial conditions (e.g. variable risetime of the laser pump). On the other hand, if configurational changes can occur by fluctuation, creation and annihilation of drops at any 'stationary' state, however slowly, then it is necessary to specify a global thermokinetic optimum if a unique stable solution is to be identified. Both the uniquely stable and hysteresis cases are experimentally observed. In this contribution the authors solve the fluid-dynamical equations for a cloud, explicitly demonstrating the degenerate nature of the boundary-value problem. The global dissipation rate is evaluated and shown to be a function of the exciton-gas density as a unique internal order parameter possessing two zeros and a maximum value, and free of explicit configurational parameters. The hypothesis of a stable maximal state in a topologically fluctuating milieu (already suggested by Onsager's dissipation principle) leads near the saturation line to strictly linear global and local flux-force relations as Euler-Lagrange equations and to explicit expressions for the drop density and exciton density which are in good functional and fair quantitative accord with conventional, low-excitation stripe and cylinder pumped experiments. The theoretical expression for the drop radius is less successful, because of the inappropriateness of the available experimental test and the strong experimental artifacts. (27 refs.)

108303 Electrons and excitons in nonlinear molecular chains. A.S.Davydov, A.V.Zolotariuk (Inst. for Theoretical Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Phys. Scr. (Sweden), vol.28, no.2, p.249-56 (Aug. 1983).
The soliton theory is developed to describe the motion of an excess electron (or intramolecular excitation) in molecular chains with a strong electron (exciton)-phonon coupling for a wide class of realistic (nonlinear) nearest-neighbour interactions. To illustrate the theory some examples such as the chain of harmonically coupled molecules (linear chain) and the chains with power anharmonicities and a core potential are considered. (5 refs.)

108304 On the theory of the one-dimensional bi-excitonic molecule. H.T.Coelho (Dept. de Fisica, Univ. Federal de Pernambuco, Recife, Brazil), A.Delfino,Jr., N.Majlis.
Physica B & C (Netherlands), vol.122B+C, no.1, p.73-84 (Sept. 1983).
Presents a model of the bi-excitonic molecule, two electrons and two holes bound together, in a quasione-dimensional semiconductor. The problem is solved following the Hyperspheric Harmonic approach, transforming it into an equivalent problem of one particle in a three-dimensional potential. The formalism admits application to any pair-wise interaction between the particles, and obtaining bound states is reduced to matrix diagonalization. The authors adopt a δ-function interaction and calculate the binding energy of the ground state in the simplest possible approximation, truncating the expansion at $l=0$. They obtain the stability of the bi-exciton, for a ratio σ of the electron and hole effective masses, whenever the colliding excitons have a kinetic energy above a threshold, also given interms of σ. The theory is reliable for $0.2 \leq \sigma \leq 1.0$. The conclusion for TTF-TCNQ is that bi-exciton formation at low T is possible. (13 refs.)

71.36 POLARITONS

(inc. photon-phonon and photon-magnon interactions)

108305 Experimental observation of long-range surface plasmon polaritons. Y.Kuwamura, M.Fukui, O.Tada (Dept. of Electronic Engng., Univ. of Tokushima, Tokushima, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2350-5 (July 1983).
The ATR technique (glass prism-index matching oil-Ag-CaF_2 single crystal) has been used to observe long-range surface plasmon polaritons discussed recently by Sarid (1981, 1982). At 632.8 nm, the authors have successfully observed the surface plasmon polaritons in the propagation distance of 105 μm. (8 refs.)

108306 Charge-density excitations at the surface of a semiconductor superlattice: a new type of surface polariton. G.F.Giuliani, J.J.Quinn (Brown Univ., Providence, RI, USA).
Phys. Rev. Lett. (USA), vol.51, no.10, p.919-22 (5 Sept. 1983).
A new type of surface polariton, which can occur at the surface of a semiconducting superlattice, is introduced. Because of the quantization of the electron energy levels by the superlattice potential this new polariton mode has the remarkable property of being free from Landau damping. (11 refs.)

108307 Optical dephasing of excitonic polaritons in CuCl studied by time-resolved, nondegenerate four-wave mixing. Y.Masumoto, S.Shionoya (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan), T.Takagahara.
Phys. Rev. Lett. (USA), vol.51, no.10, p.923-6 (5 Sept. 1983).
Optical dephasing of excitonic polaritons in CuCl is directly measured for the first time in the picosecond time domain by means of time-resolved, nondegenerate four-wave mixing. Dephasing of the ω_1 polariton pulse is probed by an interrogation ω_2 polariton pulse whose group velocity is faster than that of the ω_1 polariton pulse. It is found that the dephasing damping constant $\Gamma/2$ of excitonic polaritons is of order of 0.01 meV and increases as $\hbar\omega_1$ approaches the exciton resonance energy from below. (12 refs.)

108308 Phonon polaritons in the presence of a magnetic field. K.Reginski (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warsaw, Poland).
Phys. Status Solidi b (Germany), vol.118, no.2, p.587-93 (1 Aug. 1983).
The problem of propagation of phonon polaritons in the presence of an external magnetic field is investigated on the basis of equations of motion derived previously. First the dispersion relations for diatomic ionic crystals in the absence of a magnetic field are derived. Then the indices of refraction of right and left circularly polarized waves are found in the case of the Faraday configuration of the system. The Faraday rotation as a function of frequency is determined. Numerical calculations are performed for NaI. (4 refs.)

108309 Surface polaritons in nonlinear media. M.Y.Yu (Inst. fur Theoretische Phys., Ruhr-Univ. Bochum, Bochum, Germany).
Phys. Rev. A (USA), vol.28, no.3, p.1855-6 (Sept. 1983).
It is shown that the general dispersion relation of electromagnetic surface waves propagating at the interface of certain types of nonlinear media can be obtained exactly without first solving for the field profiles across the boundary. (7 refs.)

108310 Polaritons in thin crystals. E.I.Bondarenko, N.M.Ivanov, E.N.Myasnikov.
Ukr. Fiz. Zh. (USSR), vol.28, no.7, p.1106-7 (July 1983). In Russian.
It is theoretically shown that the dispersion of self-generated waveguide modes in a thin crystal should be such that as if the force of the oscillator realising the phototransition in the crystal effectively decreases with decreasing thickness. (6 refs.) *V.G.P.*

71.38 POLARONS AND ELECTRON-PHONON INTERACTIONS

(for electron-phonon interactions in lattices, see also 63.20K)

108311 Electron-phonon coupling detection in infrared spectra of ion-radical salts based on dibenztetrathiofulvalen. V.A.Starodub, T.B.Drushlyak, L.A.Sleta (Kharkov A.M. Gorky State Univ., Kharkov, USSR).
Int. J. Quantum Chem. (USA), vol.24, no.2, p.149-59 (Aug. 1983).
The electron-phonon-coupling constants in a cation radical of dibenztetrathiofulvalen ($DBTTF^+$.) have been calculated. To calculate the electronic structure of $DBTTF^+$. in equilibrium and distorted structures use was made of the unrestricted Hartree-Fock method as π-electron approximation for symmetrical vibrations of $DBTTF^+$.. The results obtained are in good agreement with the experimental data on IR spectra of DBTTF-based cation-radical salts. (21 refs.)

108312 Two-polaron solution and its stability in the continuum model of polyacetylene. Y.Onodera, S.Okuno (Dept. of Phys., Tokyo Metropolitan Univ., Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2478-84 (July 1983).
Explicit two-polaron solution, is found in the continuum model of trans-polyacetylene. The solution is explored to examine stability of two polarons. It is found that two free polarons attract each other with a long range force until they form a single polaron with two carriers therein, which then dissociates into charged kink-antikink pair owing to a short range repulsion. Thus the reaction mechanism of two polarons into two charged kinks is clarified.

71.45 COLLECTIVE EFFECTS

108313 Defects in the sine-Gordon model: statics. H.Reisinger, F.Schwabl (Phys. Dept., Tech. Univ. Munchen, Garching, Germany).
Z. Phys. B (Germany), vol.52, no.2, p.151-70 (1983).
The one-dimensional sine-Gordon model where the field couples linearly to localized defects is studied. This model describes the phase fluctuations of one-dimensional charge density waves if amplitude fluctuations are neglected. For isolated defects the nonlinear stationarity conditions can be solved analytically. Given these stationary solutions the fluctuation spectrum consisting of a bound state and the scattering states and the relevant correlation functions can be computed exactly. The stationary states for a system of two defects are presented. The free energies as a function of the separation of the defects is computed for the absolutely stable stages and for the local minima of the free energy function. This allows the authors to consider the interaction of the defects induced by the sine-Gordon field. Finally they compute the order parameter correlation function for a random distribution of defects for small concentration n. Devising a cumulant expansion the correlation function is found exactly in the first order in n. Their result contains the combined effect of the defects on the stationary states and on the phonon Green's function. It has applicability beyond the present context. (19 refs.)

108314 On the structure of solitary waves in molecular chains. V.I.Kruglov (Inst. of Phys., Acad. of Sci., Minsk, Byelorussian SSR).
J. Phys. C (GB), vol.16, no.26, p.5083-91 (20 Sept. 1983).
The structure of solitary waves in a quantum molecular chain, with the contribution of phonons with different wavenumbers taken into account, is investigated. The problem is solved on the basis of a non-linear non-local wave equation. It is shown that there exist two types of localised collective excitations which depend on the excitation velocity v and the carrier wave phase velocity v_c. The criteria are considered of continuity and stability of excited bound multiparticle states and the estimation of their validity for the typical parameter values of a molecular chain is presented. (13 refs.)

108315 Neutron investigations of the charge-density wave in α-uranium. J.C.Marmeggi, A.Delapalme, G.H.Lander, C.Vettier (Lab. de Cristallographie, CNRS, Grenoble, France).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.263-6 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The authors report on an experiment to measure the intensities of 240 first-order satellites discovered at low temperature in α-U and having an incommensurable wave vector $\mathbf{q}=[0.5, 0.176, 0.182]$. Details of the model based on the displacements along the three crystallographic axes and some of its possible shortcomings are presented. (13 refs.)

108316 Charge orderings and lattice distortions in complex TCNQ salts. S.Robaszkiewicz, T.Kostyrko (Inst. of Phys., A. Mickiewicz Univ., Poznan, Poland).
Physica B & C (Netherlands), vol.121B+C, no.1-2, p.134-52 (1983).
A model for the description of charge orderings and distortions in complex TCNQ salts involving intra- and interchain electron interactions and electron-lattice couplings is investigated. Its thermodynamical properties are analysed in the limit of infinitely strong intramolecular Coulomb repulsion, treating intermolecular interactions within the two-sublattice H-F approximation. Stability conditions for various types of orderings are determined. Site charge ordering and dimerization accompanied by bond charge ordering are found to coexist only in a limited range of parameters diminished by the hopping and the electron-phonon coupling via Coulomb forces. Depending on the value of the latter, interaction phase transitions in the system can be continuous or not. Intermolecular Coulomb interaction stabilizes site charge ordering but it can also essentially enhance transition temperatures and energy gap in dimerized phases. For experimentally reliable values of parameters the energy gaps predicted by the model are in good agreement with those observed in $D^+(TCNQ)_2^-$. (57 refs.)

108317 Commensurate charge-density-wave states of a layer of the 2H-$TaSe_2$ structure. A.E.Jacobs, P.D.Poll, M.B.Walker (Dept. of Phys., Scarborough Coll., Univ. of Toronto, Toronto, Ontario, Canada).
Phys. Rev. B (USA), vol.28, no.3, p.1621-2 (1 Aug. 1983).
The commensurate charge-density-wave states of a single layer of the 2*H*-$TaSe_2$ structure are studied theoretically. A new phase, with two of its charge-density-wave amplitudes much larger than the third is stable in a limited region of the parameter space of the model of Jacobs and Walker. (7 refs.)

71.45G Exchange, correlation, dielectric and magnetic functions, plasmons

108318 Plasmon resonance broadening in spheroidal metal particles. W.A.Kraus, G.C.Schatz (Dept. of Chem., Northwestern Univ. Evanston, IL, USA).
Chem. Phys. Lett. (Netherlands), vol.99, no.4, p.353-7 (12 Aug. 1983).
An analytical expression for the surface scattering contribution to the width of plasmon resonances in spheroidally shaped metal particles is derived. The result is compared with analogous quantum-mechanical expressions. (6 refs.)

108319 Anisotropy of the dielectric function within a liquid-vapour interface. J.Lekner (Phys. Dept., Victoria Univ. of Wellington, Wellington, New Zealand).
Mol. Phys. (GB), vol.49, no.6, p.1385-400 (20 Aug. 1983).
The authors calculate $\epsilon_\perp(z)$ and $\epsilon_\parallel(z)$, the dielectric functions which characterize the response of a planar interface to an electric field perpendicular to or parallel to the interface. These functions each differ from the Clausius-Mossotti form by an interface term, which depends on the variation in density and in the pair correlation function through the interface. Detailed calculations are carried out for Ar, Kr and Xe, using a molecular dynamics pair correlation function, and three model density profiles. The effect of anisotropy on ellipsometric estimates of the interface thickness is small because of cancellations between opposing terms. (27 refs.)

108320 Spectrum of surface quantum plasmon resonances in high-magnetic field. G.Gumbs, D.J.W.Geldart (Dept. of Phys., Dalhousie Univ., Halifax, Nova Scotia, Canada).
Physica A (Netherlands), vol.120A, no.1-2, p.178-84 (1983).
For long wavelengths, there is an undamped quantum-type plasmon resonance (QPR) near each higher multiple of the cyclotron frequency $n\omega_c$ ($n\geq2$), for a bulk quantum plasma in the presence of an external magnetic field. This mode involves the coupling between magnetoplasmons and single-particle excitations of the Landau levels of the electron gas. The nonlocal surface QPR is examined under high-magnetic field conditions, with the electrons occupying the lowest Landau level only. The magnetic field is perpendicular to the surface of the plasma. The surface QPR is evaluated in the long-wavelength limit, for the degenerate case. It is shown that this mode is naturally damped. (7 refs.)

108321 External fields in the self-consistent theory of electronic states: a new method for direct evaluation of macroscopic and microscopic dielectric response. K.Kunc (Lab. de Phys. des Solides, Paris, France), R.Resta.
Phys. Rev. Lett. (USA), vol.51, no.8, p.686-9 (22 Aug. 1983).
It is shown that the macroscopic and microscopic dielectric responses to a constant electric field can be directly dealt with by a method which is general, alternative to linear-response theory, and not restricted to linear effects. The basic features of the theory are discussed; explicit calculations of the macroscopic dielectric constant, microscopic local fields, and transverse effective charges are presented for Ge and GaAs within the local-density functional theory. (16 refs.)

108322 Effect of screening on exchange effects for an inhomogeneous electron gas at finite temperatures. P.V.Panat, R.E.Amritkar (Dept. of Phys., Poona Univ., Pune, India).
Phys. Rev. A (USA), vol.28, no.3, p.1859-63 (Sept. 1983).
Recently, Gupta and Rajagopal [Phys. Rev. A, 21, 2064, 1980] have calculated thermodynamic-exchange energy and potential in an 'exchange-only' approximation and later calculated the correlation potential exactly within the random-phase approximation [Phys. Rev. A, 22, 2792, 1980]. In this paper the authors estimate the effect of screening in an approximate way. The formula obtained for the correlation potential is shown to be the product of two functions, one being that of density and the other being that of dimensionless temperature. The calculated values agree reasonably in the intermediate degeneracy region and are good at higher temperatures and densities. It is shown that the specific heat for the system can also be expressed in terms of the same parameters and the $(T/\ln T)$-type divergence disappears. (12 refs.)

108323 Concentration-dependent dielectric response of $Ga_{1-x}Al_xAs$. P.Csavinszky, K.R.Brownstein (Dept. of Phys., Univ. of Maine, Orono, ME, USA).
Phys. Rev. B (USA), vol.28, no.4, p.2226-8 (15 Aug. 1983).
The dielectric properties of the semiconductor $Ga_{1-x}Al_xAs$ are of importance in the study of electronic states and charge conduction. In this paper the authors present analytical composition-dependent spatial dielectric functions for $Ga_{1-x}Al_xAs$ involving compositions from $x=0.05$ to $x=0.45$ in steps of 0.05. The spatial dielectric functions they present describe the response of $Ga_{1-x}Al_xAs$ to charges of $Z=\pm1$, ±2 (in atomic units) embedded in the semiconductor. (10 refs.)

108324 Plasma resonance in cubic lattice of 8-atom cluster of indium in zeolite matrix. Yu.A.Alexeev, E.A.Bakulin, V.N.Bogomolov, S.V.Kholodkevich, E.G.Ostroumova, E.V.Stepin (A.F. Ioffe Physico-Tech. Inst., Acad. of Sci., Leningrad, USSR).
Solid State Commun. (USA), vol.47, no.4, p.307-8 (July 1983).
A plasma peak in the spectrum of inelastic electron loss was found on a model object which was a cubic sublattice of 8-atom indium clusters in dielec-

tric zeolite matrix. The plasmon energy (5.2 eV) in such microcluster system differs essentially from that of 11.6 eV in bulk indium and lies within the range where the discrete character of the electron spectrum is well pronounced. (9 refs.)

108325 Evaluation of cohesive energies for NaCl-NaBr mixed crystals. N.Agrawal, R.P.Goyal, B.K.Gupta, R.K.Singh (Dept. of Phys., St. John's Coll., Agra, India).
Phys. Status Solidi b (Germany), vol.118, no.2, p.K141-6 (1 Aug. 1983).
To develop a more realistic interaction mechanism in mixed crystal systems the authors have proposed a model potential to predict the accurate values of cohesive energy. The model potential consists of long-range Coulomb and three-body interactions, short-range van der Waals attractions, and Hafemeister-Zarht type repulsion, effective up to second neighbours. The values of cohesive energy calculated from the interionic potential in the case of host crystals are in excellent agreement with the available experimental data. (28 refs.)

71.50 LOCALIZED SINGLE-PARTICLE ELECTRONIC STATES

(exc. impurities; for localisation in disordered structures, see 71.55J)

108326 On quantum localization of conduction electrons under magnetic breakdown conditions. L.Yu.Gorelik.
Fiz. Nizk. Temp. (USSR), vol.9, no.8, p.888-90 (Aug. 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
A model incommensurate system realized under coherent magnetic breakdown conditions is considered. The spectrum and form of localized electron wave functions are found. The transition from periodic to incommensurate phase is analyzed. (6 refs.)

108327 Localisation in the Lloyd model. D.J.Thouless (Dept. of Phys., Univ. of Washington, Seattle, WA, USA).
J. Phys. C (GB), vol.16, no.26, p.L929-31 (20 Sept. 1983).
Recent claims that for the Lloyd model in arbitrarily many dimensions electrons are always localised are shown to be ill founded. (7 refs.)

71.55 IMPURITY AND DEFECT LEVELS

108328 Symmetrical contours of deep level EL2 in liquid encapsulated Czochralski GaAs. D.E.Holmes, R.T.Chen, K.R.Elliott, C.G.Kirkpatrick (Microelectronics Res. & Dev. Center, Rockwell Internat., Thousand Oaks, CA, USA).
Appl. Phys. Lett. (USA), vol.43, no.3, p.305-7 (1 Aug. 1983).
The authors have determined the isoconcentration contours of the deep level EL2 across 3-in-diameter, semi-insulating GaAs crystals grown by the liquid encapsulated Czochralski technique. The contours are essentially fourfold symmetric at the seed end of the crystals. The symmetrical pattern is independent of the melt stoichiometry and the relative direction of crystal and crucible rotation. EL2 distributions in the tail of the same crystals are often of lower symmetry. The results support a native defect model for EL2 in which the formation of the defect is enhanced by stress in the crystal. (19 refs.)

108329 The recombination behavior of platinum in silicon. Zhou Jie, Li Shu-ying, Tan Fei (Inst. of Semiconductor, Acad. Sinica, Peking, China).
Acta Phys. Sin. (China), vol.32, no.4, p.497-506 (April 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)* [received: Sept. 1983]
With dark capacitance transient method, electron emission and capture transient processes at deep level, which is located within an energy range of KT above E_F in depleted region of zero-biased junction, have been observed in Pt diffused deep diffusion junction of n-Si and p-Si with different background doping density. These transient behaviors agree with the solution of electron variation rate equation of deep level for different initial conditions at that place. In this paper a mechanism is also proposed to explain the occurrence of emission transient. It is considered that the origin of emission transient is closely related to the structure in the deep diffusion junctions and the capture transient to the capture characteristic of different impurity. (2 refs.)

108330 Thermodynamics of a spin 1/2 Anderson impurity in the $U \to \infty$ limit. P.Schlottmann (Fachbereich Phys., Freie Univ. Berlin, Berlin, Germany).
Z. Phys. B (Germany), vol.52, no.2, p.127-32 (1983).
The Bethe-ansatz describing the thermodynamics of the non-degenerate Anderson model are derived in the $U \to \infty$ limit (double occupation of the localized level is excluded). The set of Bethe-ansatz equations for the $U \to \infty$ limit is considerably different from the one for the U case. The Kondo limit the Fermi liquid behavior at low T and the high T perturbation expansion for the thermodynamic potential are extracted from these equations. (20 refs.)

108331 Characterization of deep levels in semi-insulating GaAs crystals by a spectroscopic photoelectrochemical current. M.Otsubo, T.Murotani (LSI Res. & Dev. Lab., Mitsubishi Electric Corp., Hyogo, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.6, p.L345-7 (June 1983).
A new method for detecting deep levels in semi-insulating GaAs crystals is proposed. With this method determination of deep level distributions over a wafer by a spectroscopic photoelectrochemical current is possible. The deep levels of 1.13 eV, 1.02 eV, 0.98 eV, and 0.70 eV have been detected in both undoped and Cr-doped materials. Two additional deep levels of 0.78 eV and 0.65 eV were detected in Cr-doped materials. A peak intensity ratio of the 1.13 eV band to the 1.43 eV increased linearly with increasing chromium content in the crystals. Nonuniform distribution of deep levels in LEC GaAs crystals has been found. (10 refs.)

108332 Oxygen-related defects in irradiated germanium. N.Fukuoka, H.Saito, Y.Kambe (Dept. of Phys., Coll. of General Education, Osaka Univ., Osaka, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.6, p.L353-5 (June 1983).
Oxygen-related defects produced in oxygen-doped germanium by 1.5 MeV electron irradiation were studied by the DLTS technique. Three electron trapping levels attributable to this type of defect were found. The $E_c-0.25$ eV level is deduced to be introduced by two kinds of defects, namely, the germanium A-center (oxygen-vacancy complex) and the defect associated with the 715 cm^{-1} infrared absorption band reported by Whan (1965). The $E_c-0.29$ eV level and the $E_c-0.13$ eV level are attributable to the defects associated with the 819 cm^{-1} and the 731 cm^{-1} infrared absorption bands in her paper. (16 refs.)

108333 Confirmation of tunneling current via traps by DLTS measurements in InGaAs photodiodes. R.Trommer, H.Albrecht (Res. Labs., Siemens AG, Munchen, Germany).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.6, p.L364-6 (June 1983).
A detailed analysis of the reverse characteristics of $In_{0.53}Ga_{0.47}As$ pin-photodiodes at various temperatures reveals, besides generation, diffusion and band-to-band tunneling of carriers, an additional contribution to the dark current due to tunneling through an energy barrier of 0.16 ± 0.02 eV. In deep-level transient spectroscopy measurements a thermal activation energy of 0.57 ± 0.01 eV, equal to the gap energy minus the tunneling barrier, has been found. From these two measurements it can be concluded that thermal activation of deep traps and subsequent tunneling of carriers into band states leads to the additional dark current component. (13 refs.)

108334 Two-centre defects and low-energy excitations in vitreous silica. L.Ferrari (Istituto di Matematica, Univ. di Ferrara, Ferrara, Italy), G.Russo.
Nuovo Cimento D (Italy), vol.2D, ser.1, no.4, p.965-92 (July-Aug. 1983).
A first-principle chemical model for IVAP-like defects in vitreous silica is proposed. It is shown that these two-centre defects are diamagnetic and, for $T<10$K, display a two-level-like energy spectrum. They also exhibit a dipolar nature in agreement with recent experimental data. A close analogy with the basic idea underlying the tunnelling-atom theory is shown, supporting the connection between low-energy excitations in amorphous materials and two-fold degenerate equilibrium positions of certain lattice sites. In contrast to previous theories, the present model predicts a large contribution of fast relaxing two-level systems at very low temperatures ($T<0.1$K), while slowly relaxing excitations achieve thermal activation only at higher temperature. This result is indirectly confirmed by deviations from linearity of the low-temperature specific heat and seems to bridge in a satisfactory way experimental results which appeared contradictory in the framework of the tunnelling-atom theory as it is usually formulated. (20 refs.)

108335 An optical characterization of defect levels induced by MBE growth of GaAs. J.P.Contour, G.Neu, M.Leroux (Phys. du Solide et Energie Solaire, CNRS, Valbonne, France), C.Chaix, B.Levesque, P.Etienne.
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.811-15 (July-Sept. 1983).
GaAs layers grown under As_4 flux at 585°C by MBE (*p*-type NID layers and *n*-type doped layers) have been studied by photoluminescence at 1.9K (UV excitation, selectively excited photoluminescence, and excitation spectroscopy). The photoluminescence lines between 1.5110 and 1.5040 eV ascribed to excitons bound to point defects associated with the use of an As_4 source have been more carefully studied in order to specify the nature of the transitions involved. Two hole spectra, and donor acceptor pair bands analysis allow to identify the excited states of two acceptor levels. The first one is attributed to the carbon contamination, the second one to which the 1.5109 eV exciton is bound is also a shallow acceptor level showing a negative chemical shift and a binding energy of 22.9 meV. (12 refs.)

108336 Acceptors in wide-gap semimagnetic semiconductors. J.Mycielski (Groupe de Phys. des Solides, Ecole Normale Superieure, Paris, France), C.Rigaux.
J. Phys. (France), vol.44, no.9, p.1041-9 (Sept. 1983).
Shallow acceptors in wide-gap zinc-blende-type semimagnetic semiconductors (like $Cd_{1-x}Mn_xTe$) are considered. The fourfold degenerate acceptor ground state is determined using Schechter's (1962) variational method. The exchange interaction with magnetic ions is then included and the splitting of the ground state is studied. It is shown that this splitting is quenched as compared with the free-hole splitting. Matrix elements for the acceptor to conduction Landau states transitions are also calculated. (25 refs.)

108337 Photoionization spectrum of deeply trapped electrons in semiconductors—results in a simple one-dimensional model. Y.Kayanuma (Dept. of Phys., Tohoku Univ., Sendai, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2472-7 (July 1983).

The deep level photoionization spectrum in a simple one-dimensional model is studied within the semiclassical Franck-Condon approximation of the electron-lattice coupling. The line shape functions are obtained exactly both for the one-electron and the two-electron system and various spectral features are discussed. The spectrum of the two-electron trapped state depends on the mutual Coulomb repulsion as well as on the electron-lattice coupling, the potential depth and the temperature. (13 refs.)

108338 Computer simulation of interacting donor electrons in the Anderson-localised regime of semiconductors. T.Takemori, H.Kamimura (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).

J. Phys. C (GB), vol.16, no.26, p.5167-87 (20 Sept. 1983).

A comupter simulation on a cluster model of n-type doped semiconductors is performed at the impurity concentration corresponding to 1.7×10^{18} cm^{-3} of Si:P, with the aim of testing the general physical picture and theoretical treatment in the 'transfer-diagonal' formulation. A simple Gaussian function is used as the basis of one-electron states, in order to calculate and take into account exactly all the matrix elements including those of the electron-electron interaction. The energy levels and wavefunctions of the ground and excited states of the clusters consisting of six randomly distributed donors are obtained. It is found that there are a large number of states which are occupied by single electrons and that the spins of these singly occupied states interact either by ferromagnetic or antiferromagnetic exchange interactions. The numerical results on specific heat and spin susceptibility averaged over 76 clusters reproduce fairly well the characteristic features observed in experiments on Si:P. The microscopic mechanism of these remarkable features is clarified by examining the many-electron wavefunctions obtained and the treatment in the 'transfer-diagonal' formulation is confirmed. (18 refs.)

108339 Splitting of the 3d levels of iron group impurities in crystals with zincblende structure. S.W.Biernacki (Inst. of Phys., Polish Acad. of Sci., Warsaw, Poland).

Phys. Status Solidi b (Germany), vol.118, no.2, p.525-33 (1 Aug. 1983).

A new parametrization scheme is presented of the crystal term energies for 3d impurities in ZnS-structure crystals. This allows a practical analysis of the optical spectra in these structures. This scheme, unlike the Tanabe-Sugano scheme, accounts for the different deformations of e- and t_2-orbitals in the tetrahedral crystal field. To avoid the complexity caused by the many unknown parameters which appear when the e- and t_2-orbitals are considered deformed to different degrees, the point charge model of the crystal field and the Slater form of the d-orbitals are employed. This provides two adjustable parameters for describing the crystal term energies. The results indicate that the energy separation between the crystal terms depends not only on the Racah parameters *B* and *C* but also on the Racah parameter *A*, and it is shown how the Racah parameters for a given impurity depend on the crystal field. The energy separation Δ between the crystal terms A_2 and T_2 is interpreted to be the sum of two terms: Δ_{cryst} the contribution due to the crystal field splitting and Δ_{rep} the contribution due to different repulsion energies between the electrons in the two states. As an example of the application of this parametrization scheme, the impurities Ti^{2+}, V^{2+}, Co^{2+}, and Ni^{2+} in ZnSe are considered. (13 refs.)

108340 Variational calculations for ground-state energies of donor-acceptor pairs. R.Englisch (Sektion Phys., Karl-Marx-Univ. Leipzig, Leipzig, Germany).

Phys. Status Solidi b (Germany), vol.118, no.2, p.605-12 (1 Aug. 1983).

For the calculation of ground-state energies of donor-acceptor (DA) pairs (and also of two related three-body problems) variational ansatzes are tested including the correlation between electron and hole. A refinement of a paper by Kartheuser et al. (1982) is presented for small distances of the DA pairs. Further, another method to solve the integrals occurring is shown which avoids numerical integration. (14 refs.)

108341 Impurity states near the fundamental absorption edge in p-CuInS$_2$. R.Tovar Barradas, J.Gonzalez, C.Rincon (Dept. de Fisica, Facultad de Ciencias, Univ. de Los Andes, Merida, Venezuela).

Phys. Status Solidi b (Germany), vol.118, no.2, p.K103-6 (1 Aug. 1983).

Although the optical, electrical, and thermal properties of $CuInS_2$ have been receiving considerable attention lately, the related problem of the impurity states in $CuInS_2$ is not well understood. An attempt has been made in order to clarify this point by analyzing the experimental results of the absorption coefficient near the fundamental edge at 76K on p-type $CuInS_2$. (11 refs.)

108342 Analytical solutions to the movement of the Fermi energy in a distribution of states. G.G.Roberts (Univ. of Durham, Durham, England), F.W.Schmidlin.

Phys. Rev. B (USA), vol.28, no.4, p.2001-6 (15 Aug. 1983).

Previous papers on this subject have demonstrated the usefulness of adopting the dominant-level approach to interpret activation-energy data. These concepts are now extended to situations involving distributions of states. Some emphasis is placed on answering the question of whether or not a single continuum of states can 'pin the Fermi level' (produce a constant activation energy over an extended temperature range). The complete problem requires numerical analysis but substantial insight can be gained by considering certain limiting situations and adopting the method of approximating state distributions by equivalent discrete densities. The authors find that the Fermi level cannot be pinned within the single distribution of states and conclude that models containing pairs of distributions are more effective in producing a constant activation energy; for example, two low-density and asymmetrical Gaussian distributions can dominate the statistics over an extended temperature range. (17 refs.)

108343 Energy levels of interstitial manganese in silicon. R.Czaputa, H.Feichtinger, J.Oswald (Inst. fuer Experimentalphys., Karl-Franzens-Univ. Graz, Graz, Austria).

Solid State Commun. (USA), vol.47, no.4, p.223-6 (July 1983).

Interstitial manganese in silicon can exist in four charge states which imply single acceptor and double donor behaviour. The corresponding level scheme with the acceptor level ($Mn^{-/o}$) at $E_c-0.13$ eV, the first donor level ($Mn^{o/+}$) at $E_c-0.45$ eV and the second donor level ($Mn^{+/++}$) at $E_v+0.30$ eV is established through EPR-controlled Hall measurements. Another deep donor level at $E_c-0.54$ eV is produced by the donor acceptor pair (MnB) whereas a more shallow one around $E_c-0.28$ eV was already attributed to a Mn_4-cluster. (13 refs.)

108344 Characterization of the potential well of a deep-level defect using field dependence of the thermal carrier emission rate. K.L.Wang, G.P.Li (Electrical Engng. Dept., Univ. of California, Los Angeles, CA, USA).

Solid State Commun. (USA), vol.47, no.4, p.233-5 (July 1983).

The electric field enhanced thermal emission rate was measured for the $E_c-0.35$ eV level of GaAs using a new reverse-biased pulsed DLTS technique. It is shown that the observed field and its temperature dependencies are probably the result of the Poole-Frenkel emission from a polarization potential well. From this study and with other annealing and the capture cross-section data, it is concluded that the defect is probably of a neutral-impurity type. (14 refs.)

108345 Defects in Zn fired ZnTe: detection of a double acceptor (Si_{Te}?). M.Magnea, J.L.Pautrat (Dept. de Recherche Fondamentale, CENG, Grenoble, France), Le Si Dang, R.Romestain, P.J.Dean.

Solid State Commun. (USA), vol.47, no.9, p.703-7 (Sept. 1983).

The authors present a detailed account of electrical and optical measurements including resonantly excited luminescence and photoexcitation spectroscopy on the acceptor and donor defects associated with the annealing of ZnTE in molten zinc. A new acceptor (X) is detected and tentatively attributed to a double neutral acceptor (SI_{Te}?) according to Zeeman and stress experiments. (15 refs.)

108346 Heavy doping effects on donor-acceptor spectra of polar semiconductors at low temperatures. H.Van Cong, S.Brunet, S.Charar (Dept. de Phys., Univ. de Perpignan, Perpignan, France).

Solid State Commun. (USA), vol.47, no.9, p.743-5 (Sept. 1983).

The heavy doping effects on donor-acceptor (DA)-pair spectra at small DA-pair distances *R* are investigated, basing on an effective screened impurity potential model given by Morgan (1965) and on the results of the *R*-dependent electron (hole)—longitudinal optical phonon interaction energy obtained by Kartheuser et al. (1980). It is suggested that the deviation of the electron-hole recombination energy by dense impurities (or at small *R*), found from the energy of the emitted photon for a zero-phonon transition, results from the band-gap narrowing effect. At large *R*, the authors have found that the energy gap of the pure ZnSe crystal is equal to 2.827 eV, in good agreement with observed results. Finally, at small *R*, the numerical results applied to ZnSe doped with In and Li impurities are compared with other theories and with observed results. (12 refs.)

108347 The deformation potential of the lowest impurity state of As in Si. A.E.Belyaev, R.M.Vinetskii, O.P.Gorodnichii.

Ukr. Fiz. Zh. (USSR), vol.28, no.7, p.1097-9 (July 1983). In Russian.

The authors have measured the Hall coefficient R dependence on the uniaxial pressure X in the (100) direction at 63K up to $X=14000$ kgs/cm^2 in monocyrstalline specimens of Si:As with concentration of $N_D\approx10^{15}$ cm^{-3}. The comparison of experimental and calculated R(X) dependencies has permitted them to determine the value of the shift constant for the deformation potential of the lowest As impurity state. (3 refs.) *V.G.P.*

108348 Electrical defect analysis following pulsed laser irradiation of unimplanted GaAs. D.Pribat, S.Delage, D.Dieumegard, M.Croset (Thomson-CSF/LCR, Orsay, France), P.C.Srivastava, J.C.Bourgoin.

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.647-52

Current-voltage, capacitance-voltage and defect spectroscopy techniques are used to characterize the electrical properties of GaAs crystals after pulsed laser irradiation with either a Nd-YAG or a ruby laser. I(V) and C(V) measurements performed in conjunction on Au/GaAs Schottky structures after laser irradiation at low energy density show an important barrier lowering, of the order of 300 mV. Carrier compensation up to $6\times10^{16}/cm^3$ is observed in a subsurface layer whose thickness increases with deposited laser energy density. DLTS is used to study the tail of laser induced defects behind the heavily compensated layer. Finally the results are compared to those obtained following conventional thermal treatment. (14 refs.)

108349 The electronic structure and formation energy of a vacancy in aluminum. B.Chakraborty, R.W.Siegel (Materials Sci. Div., Argonne Nat. Lab., Argonne, IL, USA).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.93-6

The electronic structure of a vacancy in Al was calculated self-consistently using norm-conserving ionic pseudopotentials obtained from ab initio atomic calculations. A 27-atom-site supercell containing 1 vacancy and 26 atoms was used to simulate the environment of the vacancy. A vacancy formation energy of 1.5 eV was also calculated (CF the experimental value of 0.66 eV). The effects of the supercell and the nature of the ionic potential on the resulting electronic structure and formation energy are discussed. Results for the electronic structure of a divacancy are also presented. (6 refs.)

108350 Electronic structure of impurities in transition metals. R.Zeller (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany), P.J.Braspenning, J.Deutz, R.Podloucky, P.H.Dederichs.

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.97-104

By applying the KKR-Green's function method self-consistent calculations have been performed for the electronic structure of impurities in transition metals. The calculations are based on the density functional theory and a muffin-tin approximation for the atomic potential. The authors discuss the problems connected with the construction of the host Green's function and with obtaining self-consistency for the perturbed potentials. Results are presented for 4d-impurities in Cu, for magnetic impurities in Cu, Ag, Al, and Mo, and for the vacancy in Cu. In the latter case also perturbed potentials at neighbouring host sites are taken into account. Friedel oscillations around 3d-impurities in Cu are also considered. (27 refs.)

108351 De Haas-van Alphen study of the solute atom yttrium in magnesium host. K.Ogawa, H.Aoki (Metal Phys. Div., Nat. Res. Inst. for Metals, Tokyo, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.329-31

Electronic structures of the solute atom Y in Mg host have been studied by measuring the de Haas-van Alphen effect. It has been found that the addition of Y has no effect on the measured dHvA frequency for the orbit $\mu_1{}^5$. The measured Dingle temperatures are nearly isotropic and are about 60K/at.% Y which is a few times larger than those of Li and In in Mg host. The application of phase shift analysis to these results shows that the d character of the outer electrons of Y atom appears to be reduced by a fair amount in Mg host but still remains considerable. 71.55J Localization in disordered structures

108352 On the solution of the periodic Anderson model. J.Kowalska, J.Zielinski (Inst. of Phys., Silesian Univ., Katowice, Poland).
Acta Phys. Pol. A (Poland), vol.A64, no.2, p.177-84 (Aug. 1983).
The periodic Anderson model is investigated by the method of equations of motion for the Green functions within the approximation which does not lead to the appearance of a hybridization gap in the symmetric case. The density of states for *f*-electrons is similar to the one corresponding to single impurity solution. The specific heat and electrical resistivity are evaluated and an approximate, qualitative discussion of the formation of temperature dependent resonance for infinite Coulomb repulsion is given. (24 refs.)

108353 Localization-delocalization transition by interactions in one-dimensional fermion systems. Y.Suzumura (Dept. of Phys., Tohoku Univ., Sendai, Japan), H.Fukuyama.
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2870-4 (Aug. 1983).
A new view is presented to treat the Anderson localization in one dimension as the impurity pinning of the phase variables of charge and spin. The authors make use of the phase Hamiltonian derived by the bosonization. By this method effects of mutual interactions are naturally included and the authors determined the phase diagram of localized and delocalized states of the spin-dependent Tomonaga model in the plane of the coupling constants.

108354 Phase correlations in one-dimensional disordered systems. M.Ya.Azbel (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), M.Rubinstein.
Phys. Rev. Lett. (USA), vol.51, no.9, p.836-9 (29 Aug. 1983).
The correlation function of the phases of a quantum particle in a one-dimensional random potential is defined and calculated analytically and numerically. Away from eigenstates it decays exponentially with the phase correlation length equal to half of the localization length, while for the eigenstates it saturates at nonzero value. (12 refs.)

108355 Density of states and charge distribution in hydrogenated amorphous silicon. H.King, B.Kramer (Phys.-Tech. Bundesanstalt, Braunschweig, Germany), A.MacKinnon.
Solid State Commun. (USA), vol.47, no.9, p.683-6 (Sept. 1983).
The local density of states and the charge distribution in a cluster model of hydrogenated amorphous silicon is calculated using the recursion method. The results indicate an average charge transfer of 0.3 electrons from silicon to hydrogen. In addition Si-H dipoles carry small negative charges, which are neutralized by a positively charged bulk of silicon atoms. There are also static spatial charge fluctuations, which are due to the topological disorder. (18 refs.)

108356 Localization and dimensionality. M.Ya.Azbel (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Solid State Commun. (USA), vol.47, no.9, p.699-701 (Sept. 1983).
Localization of eigenstates depends not only on dimensionality but also on the nature of the disorder. Thus the states in two dimensions may or may not be exponentially localized. Grain boundaries may localize all states in any dimensionality. It is shown that there exists an exact scaling of the transfer matrix, which is valid in any dimensionality. (15 refs.)

108357 Defect states in trans-polyacetylene. J.P.Albert, C.Jouanin (Groupe des Semiconducteurs, Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
Solid State Commun. (USA), vol.47, no.10, p.825-9 (Sept. 1983).
The interaction of a dopant molecule with the π electrons of a single $(CH)_x$ chain is studied within a model potential which incorporates the core repulsive effects. The soliton type defects are found to be energetically favoured upon doping whereas the position of the induced levels inside the gap are strongly affected by the interaction. (9 refs.)

71.70 LEVEL SPLITTING AND INTERACTIONS

(see also 75.10 – in magnetic phenomena, 75.30E Exchange and superexchange interactions, 73.20 Electronic surface states)

108358 Electronic states in solution and charge transfer. S.U.M.Khan, J.O'M.Bockris (Dept. of Chem., Texas A&M Univ., College Station, TX, USA).
J. Phys. Chem. (USA), vol.87, no.14, p.2599-603 (7 July 1983).
The Fermi level of electrons in solution is not the negative of the vacuum scale redox potential. One needs to know the ground states of the donor and acceptor ions in solution and the distribution of their higher energy states. Gaussian distribution of electronic states in solution is not consistent with experimental results, whereas Maxwell-Boltzmann distribution of such states exhibits conformity with it. Activation of ions in solution before electron exchange occurs by means of collisional energy transfer. It is possible because of the presence of continuum of vibration-rotation states in the ion-solvent complex. Auger transitions in the electrochemical system are unlikely. Shifting of an applied potential shifts the bulk energy levels (measured with respect to an electron at infinity) in both metal and solution in opposite directions. (34 refs.)

108359 Ground state properties of the Anderson model in the limit of large spin-orbit degeneracy. J.W.Rasul, A.C.Hewson (Dept. of Math., Imperial Coll., London, England).
J. Phys. C (GB), vol.16, no.26, p.L933-8 (20 Sept. 1983).
The spin-orbit degenerate Anderson model is investigated in the limit of large spin-orbit degeneracy (*N*). Low-temperature properties are discussed, yielding the full range of intermediate to local moment behaviour. The relation between ground state susceptibility and valence is examined to leading and next-leading orders in $1/N$. (19 refs.)

108360 Valence fluctuations and magnetic-nonmagnetic transitions in a model for intermediate-valence systems. H.V.Sharma, I.Singh (Dept. of Phys., Univ. of Roorkee, Roorkee, India).
Phys. Status Solidi b (Germany), vol.118, no.2, p.511-20 (1 Aug. 1983).
The magnetic properties of mixed-valence systems are studied using the Anderson lattice model, including an intersite exchange interaction. It is found that (i) the ferromagnetic ordering is favoured in the nearly integral-valent case and (ii) in the intermediate-valence case the ratio of exchange to hybridisation dictates the absence or presence of magnetic ordering. The magnetic phase diagram and the variation of magnetic susceptibility and specific heat in the paramagnetic phase. Fairly good qualitative agreement with the exprimental findings is obtained. (30 refs.)

108361 Mixed-valent ground state of CeO_2. A.Fujimori (Lab. fur Festkorperphys., Eidgenossiche Tech. Hochschule, Zurich, Switzerland).
Phys. Rev. B (USA), vol.28, no.4, p.2281-3 (15 Aug. 1983).
The electronic ground state, core-hole states, and valence-hole states of CeO_2 are studied taking into account strong correlation among the 4*f* electrons. The ground state is considered as a mixture of two configurations, $4f^0$ and spin-singlet totally symmetric $4f^1$-O 2*p*-hole states. By an analysis of the core-level photoemission spectrum, the 4*f* occupancy is obtained to be about 0.6. The possibility of this mixed-valence mechanism in metallic mixed-valent systems and α-Ce is also discussed. (20 refs.)

71.70C Crystal and ligand fields

108362 Crystal field splittings and rapid direct relaxation of Fe^{2+} spin states from inelastic neutron scattering. I.Svare (Phys. Dept., Univ. of Trondheim, Trondheim, Norway), K.Otnes.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.159-62 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Inelastic neutron scattering on spin states of Fe^{2+} ($S=2$) in some crystals is reported. The results for the crystal field splitting in $FeSiF_6.6H_2O$ and $Fe(ND_4)_2(SO_4)_2.6D_2O$ are in agreement with far infrared spectroscopy and deductions from specific heat. The inelastic lines in $FeSiF_6.6H_2O$ broaden with increasing temperature and disappear above 100K because the direct relaxation between the Fe^{2+} spin states is very rapid; this is discussed in relation to data from NMR relaxation. (17 refs.)

108363 On the cooperative Jahn-Teller effect in ternary chromium and copper halides. W.J.Crama, W.J.A.Maaskant (Gorlaeus Labs., State Univ. Leiden, Leiden, Netherlands).
Physica B & C (Netherlands), vol.121B+C, no.1-2, p.219-32 (1983).
The theory of the cooperative Jahn-Teller effect ($E\otimes\epsilon$) developed by Hock et al. (1978) for crystals with a simple cubic cell is reformulated for crystals with a hexagonal perovskite (2L) type structure, space group $P6_3/mmc$. The description can be characterized as a mean field theory based on a Three States Potts model. Assuming only nearest neighbour interactions between Jahn-Teller centres in the a, b plane and up to next nearest neighbours along the c axis it is possible to derive a large number of structures for the static Jahn-Teller effect. In relation with this the recently found structure types (four) of a number of Cu^{2+} and Cr^{2+} compounds are discussed. Probably the phase transition from the partly disordered phase of $RbCrCl_3$ to the paradistortive phase is of the second order. (19 refs.)

108364 Crystal field for ionic and metallic compounds. I. Crystal field theory. S.Adam (Inst. Central de Fizica, IFIN, Bucuresti, Rumania).
Stud. & Cercet. Fiz. (Rumania), vol.35, no.7, p.623-45 (1983). In Rumanian.
The crystal field Hamiltonian for cubic and hexagonal compounds is brought into the standard form of crystal field theory by a general symmetrization technique which uses point group considerations only. The obtained crystal field coefficients are expressed as products between those given by Hutchings (1964) and some geometrical structure factors, which include the relative contribution of all the neighbouring ions to the crystal field. The classic work of Bethe on the splitting of atomic terms in crystalline fields of the various symmetries is presented, including the introduction of the crystal double groups. (59 refs.)

108365 Crystal field for ionic and metallic compounds. II. Calculation of the nonzero matrix elements of the crystal field Hamiltonian. S.Adam (Inst. Central de Fizica, IFIN, Bucuresti, Rumania).
Stud. & Cercet. Fiz. (Rumania), vol.35, no.7, p.646-70 (1983). In Rumanian.
For pt.I see ibid., vol.35, no.7, p.623 (1983). Three calculation methods for the determination of the matrix elements of the crystal field Hamiltonian are reported: (i) the direct integration method, (ii) Stevens operator equivalents method, and (iii) spin Hamiltonian methods. In each case some examples are given for various compounds. Finally, some physical information which can be drawn from these matrix elements is discussed. (37 refs.)

108366 Hyperfine interactions measurements on ^{181}Ta probes in HfV_2H_x compounds: ($0\leq x\lesssim 4$). R.Heidinger, P.Peretto, S.Choulet (DRF/Lab. Interactions Hyperfines, CENG, Grenoble, France).
Solid State Commun. (USA), vol.47, no.4, p.283-9 (July 1983).
The electric field gradient (EFG) has been measured on ^{181}Ta probe sites in HfV_2H_x alloys ($0\leq x\lesssim 4$) using the time differential perturbed angular correlation technique. One observes that the main component V_{zz} of the EFG decreases by a factor of two for hydrogen concentrations increasing from $x=0$ to $x=4$ hydrogen atoms/formula. The opposite behavior was observed on ^{51}V by using the NMR technique. At $T=4.2K$ the EFG tensor is non-axially symmetric. The observed asymmetry factor for $x=0$ is $\eta=0.58(3)$ and it slightly increases to $\nu=0.70$ for $x\simeq 4$. The system is orthorhombic at low temperatures for all x and the experiments suggest that hydrogen would stabilize a tetragonal phase at higher temperatures. The relaxation effects are absent for $x=0$ and vanishingly small for $x\simeq 4$ but they are observed at intermediate concentrations supporting the idea of a hydrogen ordering for $x=4$. 71.70E Spin-orbit coupling, Zeeman, Stark and strain splitting

108367 Superposition model of the orbit-lattice interaction. I. Analysis of strain results for Dy^{3+}:CaF_2. S.C.Chen, D.J.Newman (Dept. of Phys., Univ. of Hong Kong, Hong Kong).
J. Phys. C (GB), vol.16, no.25, p.5031-8 (10 Sept. 1983).
The strain results of Baker and Currell (1976) and Calvo et al. (1974) are analysed in terms of the superposition model using a complete diagonalisation of the $J={}^{15}/_{2}$ ground-multiplet Hamiltonian matrix. The order of magnitude of the fitting errors is similar to that of the data uncertainties and sensible values of superposition-model parameters are obtained. There is evidence that internal-strain effects are important and that local-strain effects are not significant in Dy^{3+}:CaF_2. (12 refs.)

71.70G Exchange interactions

108368 Indirect exchange interaction between two doubly bridged paramagnetic atoms. A coupled-cluster model study. E.L.Bominaar, R.Block (Inst. of Theoretical Chem., Univ. of Amsterdam, Amsterdam, Netherlands).
Physica B & C (Netherlands), vol.121B+C, no.1-2, p.109-20 (1983).
A model analysis is made of the influence of the ligands and the geometrical structure on the exchange-coupling constant, ecc, between two paramagnetic cations doubly bridged by two diamagnetic ligands. The model is based on a four-center, six-electron description of the superexchange unit, symmetry D_{2h}, with 1s Slater type orbitals. A coupled-cluster method is employed. First, SCF orbitals are constructed for the unpaired electrons neglecting the interactions between the cations. Then, using these nonorthogonal orbitals, the direct exchange is evaluated. In the latter step, the influence of the ligands is gradually diminished and the results are compared with those from complete configuration interaction. It is found that the Coulomb and exchange ligand potentials are important in the evaluation of the ecc. Further, the cation-ligand-cation angle for which the ecc is equal to zero is not sensitive to variations of the ligand-admixture coefficient in the cation orbitals. The values of the ecc, however, do change essentially. Finally, the usual application of the Heitler-London treatment is revised. It is shown that the off-diagonal Lagrange multipliers in the SCF procedures introduce non-negligible contributions of the ligands to the ecc. (32 refs.)

71.70J Nuclear states and interactions

108369 Evidence for the Ham effect in bis-tetramethylammonium hexachloroneptunate (IV). K.D.Warren (Dept,. of Chem., Univ. Coll., Cardiff, Wales).
Chem. Phys. Lett. (Netherlands), vol.99, no.5-6, p.427-31 (19 Aug. 1983).
The possible reduction of angular momentum contributions via the Ham effect is considered for the Jahn-Teller-active Γ_8 ground level of f^3 systems in O^* symmetry. The magnetic susceptibility behaviour reported for the title compound is consistent with a predominant $\Gamma_8\otimes\tau_{2g}$ coupling, with

$E_{JT}/\hbar\omega \approx 0.10$, and the interpretation of paramagnetic resonance data for Np^{4+} in Cs_2ZrCl_6 is also facilitated by this assumption. (26 refs.)

108370 Paramagnetic hyperfine structure of iron (57) in $V_{1-x}Fe_xO_2$. J.Pebler (Fachbereich Chem., Philipps-Univ. Marburg, Marburg, Germany).
Phys. Status Solidi a (Germany), vol.78, no.2, p.589-94 (16 Aug. 1983).
With the aid of Fe(57) Mossbauer spectroscopy the nuclear hyperfine structure corresponding to the crystal states of trivalent iron in VO_2 is observed for polycrystalline paramagnetic samples of $V_{0.9985}Fe_{0.0015}O_2$ and $V_{0.9974}Fe_{0.0026}O_2$ at temperatures between 4.2 and 200K. (19 refs.)

108371 Estimation of applicability of the electrostatic model to calculate the crystal field parameters in garnets. M.Wojcik (Inst. of Phys., Polish Acad. of Sci., Warsaw, Poland).
Physica B & C (Netherlands), vol.121B+C, no.3, p.370-88 (Aug. 1983).
The electrostatic model is used to calculate the electric field gradient (EFG) at the cation sites for a number of garnets, such as *R*AlG (*R*=Lu, Yb, Y, Dy, Gd), YFeG, YGaG and $Na_3Sc_2V_3O_{12}$, as well as the optical crystal field parameters (CFP)$-Dq$, ν, ν', for Cr^{3+} ions in YAlG in the octahedral sites. The calculations include the effects of electrical polarization of the oxygen sublattices (self-consistent dipole and quadrupole moments) and the local deformation of the lattice due to substitution of Al^{3+} and Cr^{3+}. It is shown that the calculated EFG correctly reflects the main properties of the experimental data. In the case of CFP for YAlG:Cr^{3+}, it is shown that this model provides a fairly good estimation of the twofold CFP whereas the fourfold CFP require a different analytical approach. (35 refs.)

71.90 OTHER TOPICS IN ELECTRON STATES

108372 Electron density profiles in metal particles dispersed in metallic media. M.W.C.Dharma-Wardana, D.Pelletier (Div. of Phys., Nat. Res. Council of Canada, Ottawa, Ontario, Canada).
Physica B & C (Netherlands), vol.122B+C, no.1, p.49-54 (Sept. 1983).
Considers the calculation of electron densities associated with metal clusters dispersed in a metallic host. The usual cluster techniques are inapplicable or intractable in this case. However, by introducing a zeroth order jellium-cluster approximation for the metal cluster the authors treat the zeroth order model exactly within density functional methods. The difference between the true cluster and the jellium cluster is suitable for treatment by perturbation theory. Illustrative calculations for Au clusters in Li host, Li in Au host and Cu in Li host have been carried out, for clusters of up to about 100 atoms. The onset of bound states associated with the cluster as a whole (cluster-orbitals), and their significance, are discussed. (9 refs.)

72.00 ELECTRONIC TRANSPORT IN CONDENSED MATTER

(for surfaces, interfaces, and thin films, see 73.)

72.10 THEORY OF ELECTRONIC TRANSPORT; SCATTERING MECHANISMS

108373 Speculation on a scaling law for superconductor-resistor mixture exponent *s* in a percolation system. J.Kertesz (Phys. Dept., Tech. Univ. Munchen, Garching, Germany).
J. Phys. A (GB), vol.16, no.13, p.L471-4 (11 Sept. 1983).
It is argued that looking for a relationship between the exponent *s* and the cluster exponents may be more promising than looking for one between the resistor-insulator exponent *t* and the cluster exponents. The author proposes $s=\nu-\beta/2$. (31 refs.)

108374 Quantum effects in the conductivity of two-dimensional disordered systems. P.A.Vorob'ev (M.V. Lomonosov State Univ., Moscow, USSR).
JETP Lett. (USA), vol.37, no.6, p.308-11 (20 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.6, p.261-3 (20 March 1983). [received: Sept. 1983]
It is shown that the coefficients multiplying the logarithms in the expressions for the quantum corrections to the conductivity of two-dimensional systems depend on the characteristics of the scattering potentials and the geometry of the Fermi surface, and also on the energy of the carriers. (9 refs.)

108375 Comment on the determination of ρ_F from damage-rate measurements. C.Abromeit (Hahn-Meitner-Inst. fur Kernforschung Berlin, Berlin, Germany).
J. Phys. F (GB), vol.13, no.9, p.L169-72 (Sept. 1983).
The determinations of ρ_F (resistivity contribution per Frenkel defect) by damage-rate measurements is discussed critically. An integral equation is derived from which ρ_F can be evaluated using the theshold energy surface concept. The inherent approximations in the numerical procedure of King et al. (1981) can be understood within the scope of this analysis. (4 refs.)

108376 Critical exponent for 3-D percolation conductivity, revisited. C.D.Mitescu, M.J.Musolf (Dept. of Phys., Pomona Coll., Claremont, CA, USA).
J. Phys. Lett. (France), vol.44, no.16, p.L679-83 (15 Aug. 1983).
When the authors apply finite-size-scaling analysis to Monte-Carlo calculations of the electrical conductivity of simple-cubic, bond- and site-percolation lattices, they obtain a correlation-length critical exponent in good agreement with current values but, for the conductivity exponent, they find $t=2.06\pm0.16$, significantly higher than the value currently cited. This new value appears, however, in essential agreement with a recently proposed theoretical conjecture. (18 refs.)

108377 Transfer matrix calculation of conductivity in three-dimensional random resistor networks at percolation threshold. B.Derrida, D.Stauffer, H.J.Herrmann, J.Vannimenus (Service de Phys. Theorique, CENS, Gif-sur-Yvette, France).
J. Phys. Lett. (France), vol.44, no.17, p.L701-6 (1 Sept. 1983).
For very long bars of size $n \times n \times L$, with $L \gg n$, and *n* up to 18, the authors calculate the conductivity of a random network of resistors and insulators. At the percolation threshold in a simple cubic lattice their Monte Carlo data give a conductivity decreasing with bar diameter *n* as $n^{-2.1}$ for site and bond percolation. Taking into account corrections to scaling with a correction exponent ω near unity, their best estimate for the conductivity exponent *t* is t/ν-2.2 ± 0.1 in both the bond and the site cases. (19 refs.)

108378 Influence of electron-phonon coupling on transport near a mobility edge. H.Mueller, P.Thomas (Fachbereich Phys., Philipps-Univ. Marburg, Marburg/Lahn, Germany).
Phys. Rev. Lett. (USA), vol.51, no.8, p.702-5 (22 Aug. 1983).
The authors treat electronic transport in disordered systems, including the electron-phonon interaction, on both sides of a mobility edge ϵ_c on the same footing. By application of a mode-coupling approximation, self-consistent equations are derived from which one gets the matrices describing density relaxation due to both coherent tunneling processes and hopping processes. The resulting conductivity interpolates between a metallic behavior well above and a hopping behavior well below ϵ_c. (15 refs.)

72.15C Electrical and thermal conduction in amorphous and liquid metals and alloys

108379 Compound-forming effect in the electrical resistivity of liquid Pb-Te alloys. T.Akasofu (Dept. of Phys., Niigata Univ., Niigata, Japan), Shin'ichi Takeda, S.Tamaki.
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2485-91 (July 1983).
The electrical resistivity of liquid Pb-Te alloys has been measured as a function of temperature and concentration. The resistivity isotherm has a remarkable maximum and the temperature coefficient of the resistivity has large negative value around the equiatomic composition, suggesting that a kind of compound formation exists at this composition. The excess resistivities are interpreted in terms of the resonance scattering caused by the compound by PbTe with a finite lifetime. A similar behaviour of the resistivity in liquid Sn-Te alloys is also explained satisfactorily by the same model. (12 refs.)

108380 The influence of small amounts of crystallinity on the transport properties of metallic glasses. B.L.Gallagher, D.Pavuna, W.Calwell (Dept. of Phys., Univ. of Leeds, Leeds, England).
J. Non-Cryst. Solids (Netherlands), vol.57, no.2, p.251-63 (1 Sept. 1983).
Small amounts of crystallinity may be present in 'amorphous' alloy specimens in the form of 'cast-in' crystallites or partially crystallized surfaces. In this paper the possible effects of such low-level crystallinity upon the measured electrical transport properties are considered. It is found that the observed ageing effects in the transport properties of a number of amorphous alloys may be explained as due to surface crystallization driven by selective oxidation. It is further argued that for the ferromagnetic Metglasses cast-in crystallites could have a significant effect particularly upon the thermopower, and that this is probably part of the explanation of the observed discrepancies between the different measured values. It is shown that even very small levels of crystallinity can have significant effects upon the measured transport properties and the many disagreements to be found in the published values are discussed in the light of this. (45 refs.)

108381 Electron charge transfer in liquid copper-tin alloys. Y.Waseda (Dept. of Materials Sci. & Engng., Univ. of Pennsylvania, Philadelphia), K.T.Jacob.
Metall. Trans. A (USA), vol.14A, no.8, p.1748-50 (Aug. 1983).
The authors show the effect of liquid structure, obtained from X-ray diffraction studies, on electron charge transfer in liquid Cu-Sn alloys. (22 refs.)

108382 Measurement of the specific electrical resistance of liquid alloys of systems Ge-Sb, Ge-Te, Sb-Te and Ge-Sb-Te. H.-U.Tshirner, I.P.Pazdrij, R.Weikart (Sektion Phys., Tech. Hochschule Karl-Marx-Stadt, Karl-Marx-Stadt, Germany).
Wiss. Z. Tech. Hochsch. Karl-Marx-Stadt (Germany), vol.25, no.2, p.219-25 (1983). In German.
The binary systems as mentioned in the title are eutectic systems. The number of conductivity electrons per atom are four in liquid germanium and five in liquid antimony. The calculated electrical resistance of liquid Ge at melting point according to the Ziman theory agrees very well with the average experimental results, whereas in the case of Sb there are deviations of about 20% between calculated and experimental results. The experimental measurement of the specific electrical resistance was done using the three-phase field method and the results were determined by comparing with the specific resistance of mercury. The discrepancy was about 2%. Curves show a comparison of theoretical and experimental results for resistance vs. concen-

tration of Sb-Ge, Ge-Te, Sb-Te and also the specific resistance as function of temperature for the compounds in question. (38 refs.) *G.R.S.*

72.15E Electrical and thermal conduction in crystalline metals and alloys

108383 Band model for excitation transport in disordered solids. R.Parson (Dept. of Chem., MIT, Cambridge, MA, USA).
Chem. Phys. Lett. (Netherlands), vol.100, no.1, p.59-62 (26 Aug. 1983).
A model for band excitation transport in a substitutionally disordered tight-binding alloy is described and illustrated. The model enables one to obtain an approximate diffusion coefficient from the pure-crystal band structure and the CPA density of states. (7 refs.)

108384 Residual resistance of metals due to vacancies. V.V.Kolesnikov, E.V.Polozhentsev, A.N.Pavlov (Sci.-Res. Inst. of Phys., State Univ., Rostov-on-Don, USSR).
Fiz. Met. & Metalloved. (USSR), vol.56, no.1, p.198-200 (July 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
Measurements of the residual resistance of a metal provide one of the simplest methods for monitoring the purity and perfection of metal samples, particularly those subjected to irradiation. A theoretical calculation is made of the contribution of vacancies to the residual resistance. The results are compared with the data on aluminium and it is shown that the contribution of vacancies to the residual resistance is quite important. (5 refs.) *A.T.*

108385 On the resistivity behaviour of some weak-ferromagnetic nickel-based alloys. P.Muth (Wissenschaftsbereich Phys., Hochschule fur Verkehrswesen 'Friedrich List', Dresden, Germany).
Phys. Status Solidi b (Germany), vol.118, no.2, p.K117-20 (1 Aug. 1983).
The addition of elements such as V, Cr, Mn, W, Ru to Ni strongly increases the resistivity and decreases the saturation magnetization. Ferromagnetism is limited to a small range and disappears at concentrations between 10 and 20 at.%. All these alloys do not follow the Slater-Pauling curve indicating that the band structure is completely altered by alloying. to get some information about the change of the electronic structure the residual sub-band resistivities of the majority and the minority spin-band $\rho\uparrow$ and $\rho\downarrow$, have been calculated from measurements of the residual resistivity and the spontaneous resistivity anisotropy. (7 refs.)

108386 A critical concentration of Ni-Mn alloys at about 6 at.% Mn. P.Muth (Wissenschaftsbereich Phys., Hochschule fur Verkehrswesen 'Friedrich List', Dresden, Germany).
Phys. Status Solidi b (Germany), vol.118, no.2, p.K137-9 (1 Aug. 1983).
The magnetic behaviour of Ni-Mn alloys is unusual in the concentration range around 25 at.% Mn due to an order-disorder transformation. But there are, too, unusual physical properties in disordered Ni-Mn alloys in the range between 5 and 10 at.% Mn. To get more information on the transport properties and the electronic structure of these alloys the residual subband resistivities of the majority and the minority spin-band, $\rho\uparrow$ and $\rho\downarrow$ have been calculated as a function of the manganese concentration. (10 refs.)

108387 On the resistive anomaly in NiCuSi and NiCuZn alloys near the Curie temperature. I.Lupsa (Dept. of Phys., Polytech. Inst., Cluj-Napoca, Rumania), E.Burzo.
Phys. Status Solidi a (Germany), vol.78, no.2, p.K155-8 (16 Aug. 1983).
In order to obtain information on the resistive anomaly at the Curie points in more complex systems, the NiCuSi and NiCuZn alloys were studied. Despite the changes of the magnetic properties of NiCuSi and NiCuZn alloys, as a function of composition, the resistive behaviour evidenced around T_C is similar for all samples. The dominant contribution to the magnetic resistivity of NiCuSi and NiCuZn solid solutions seems to be due to short-range fluctuations. (11 refs.)

108388 Transport equations for many-particle systems. W.Hansch, G.D.Mahan (Phys. Dept., Indiana Univ., Bloomington, IN, USA).
Phys. Rev. B (USA), vol.28, no.4, p.1902-22 (15 Aug. 1983).
The formalism of Kadanoff and Baym (1962) is used to derive a new transport equation for many-particle systems in DC electric fields. The authors use it to derive the conductivity of a metal, when limited by the electron-phonon interaction. The final result is identical to Holstein's formula (1964), which he derived from the Kubo formula. They also solved two other problems: the electrical current in a system limited by Gaussian white noise, and the diffusion coefficient from impurity scattering. They also discuss the lack of thermal stability in particle systems limited by Gaussian white noise. (27 refs.)

108389 Resistivity of the $Ce(Rh_{1-y}Pt_y)_2$ system. A.Harrus, J.Timlin, T.Mihalisin (Dept. of Phys., Temple Univ., Philadelphia, PA, USA), A.I.Abou-Aly.
Solid State Commun. (USA), vol.47, no.9, p.731-5 (Sept. 1983).
The electrical resistivities of $Ce(Rh_{1-y}Pt_y)_2$ samples, and of $La(Rh_{1-y}Pt_y)_2$ samples have been measured from 2 to 300K. The data suggest that an evolution takes place from antiferromagnetic crystal field split trivalent Ce behavior for pure $CePt_2$ to Kondo lattice behavior with diminishing crystal field effects for $0.5<y<1$ to mixed valence behavior for $y<0.5$. Comparisons are made to the behavior observed in other systems such as $Ce(Pd_{1-x}Rh_x)_3$, $Ce(Pd_{1-y}Ag_y)_3$ and $Ce(Sn_{1-y}In_y)_3$. (15 refs.)

108390 Low-temperature investigations of the system α-R(H, D)$_x$ with R=Er, Tm, Lu after quench and/or electron irradiation. J.N.Daou, P.Vajda (Univ. Paris-Sud, Orsay, France), A.Lucasson, P.Lucasson.
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.325-8
The electrical resistivity of the solid solutions of H in Er, Tm and Lu exhibits an anomaly at ~160K. Quenches across the anomaly and subthreshold electron irradiations at liquid helium introduce a $\Delta\rho$ which recovers in one stage in the anomaly region. The observations are interpreted through a 'condensation' of hydrogen into H-H pairs of lower ρ, with a concentration- and isotope mass-dependent binding energy. Quench and irradiation produce isolated H-atoms as defects; upon annealing, they reform into pairs just before the pair dissociation. The H-defects interact with magnetically ordered structures in Er and Tm. (7 refs.)

72.15G Galvanomagnetic and other magnetotransport effects

108391 Galvanomagnetic effects in quenched aluminium. Y.Ueda, T.Kino (Lab. of Crystal Phys., Hiroshima Univ., Hiroshima, Japan).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.294-6
The Hall coefficient, the transverse magnetoresistance and the longitudinal one of quenched polycrystalline aluminium have been measured in a high-field region at 4.2K. The measured Hall coefficient $R_H=(1.02\pm0.01)\times10^{-10}$ m^3/C agrees with the theoretically calculated value in spite of the existence of vacancies or its clusters. Anomalously small values are obtained for the transverse magnetoresistance and the longitudinal one in specimens quenched from 400°C and subsequently aged at room temperature to form vacancy clusters. A model based on the spacing of vacancy clusters and the cyclotron radius of a conduction electron is proposed to explain the anomalous decrease of the magnetoresistances. (11 refs.)

72.15H Thermomagnetic effects

108392 Thermopower in high magnetic fields: electron-phonon mass enhancement. W.Hansch, G.D.Mahan (Dept. of Phys., Indiana Univ., Bloomington, IN, USA).
Phys. Rev. B (USA), vol.28, no.4, p.1886-901 (15 Aug. 1983).
The authors calculate the adiabatic thermopower in a high magnetic field. Continuing their previous work, they derive a many-body transport equation including the magnetic field and derive the high-field conductivity tensor. The transport equation is derived by both the Keldysh (1964) and the Kadanoff-Baym (1962) nonequilibrium formulation of many-body systems. The results published by Opsal, Thaler, and Bass (1976) are confirmed to a certain extent. Electron-phonon mass enhancement is present in the adiabatic thermopower in high magnetic fields. (30 refs.)

72.15J Thermoelectric effects

108393 Dependence of the thermal electromotive force of aluminum alloys on the grain size. T.I.Pan'ko, T.L.Borisova, S.D.Vangenheim (Inst. of Phys. Engng., Acad. of Sci., Donetsk, Ukrainian SSR).
Phys. Met. (GB). Translation of: Metallofizika, Kiev (USSR), vol.4, no.3, p.461-9 (1982). [received: Aug. 1983]
Contributions by the lattice and grain boundaries to the thermal electromotive force of aluminum alloys have been estimated separately from the dependence of the thermal EMF on the grain size. (10 refs.)

108394 Relation between thermal EMF of low-alloyed nickel base alloys and structure of Ni 3d band. V.A.Cherenkov (Res. & Design Inst. of Alloys of Nonferrous Metals, Moscow, USSR).
Phys. Met. (GB). Translation of: Metallofizika, Kiev (USSR), vol.4, no.3, p.601-5 (1982). [received: Aug. 1983]
The thermal EMF of dilute alloys of nickel and 3d elements is interpreted within the framework of a two-current conduction model using the theory of s-d scattering at phonons, magnons and magnetic impurities. The purpose is to establish a correlation between the thermal EMF and composition of binary nickel-base alloys in a wide temperature range, with the second element being primarily a transition metal. The inadequate description of the thermal EMF of nickel-base alloys in the Ziman and Beal-Monod-Weiner theories may apparently be explained as follows. The theories disregard: i) changes in the Fermi surface of nickel during its alloying, ii) scattering of conduction electrons (from s to d band) at magnons and phonons, and iii) s-d-hybridization. (9 refs.)

108395 Thermo-electromotive force of solid and liquid indium-based metallic solutions. V.I.Ivlev, V.A.Yudin.
Russ. Metall. (GB), no.3, p.33-6 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.36-9 (1982).
All the impurities that form solid solutions in indium outside the dependence of their position in the periodic table reduce the positive absolute thermo-emf of solid indium in the range from room temperature to melting point. In the two-phase range between solidus and liquidus (with a fairly wide temperature range between), the thermo-emf of indium alloys is determined virtually by the relative amounts of solid and liquid phases. (10 refs.)

72.15N Collective modes, e.g. in one-dimensional conductors

108396 Enhancement of electrical conductivity of polyacetylene by electron beam irradiation in the presence of dopant. K.Yoshino, S.Hayashi, G.Ishii, Y.Inuishi (Faculty of Engng., Osaka Univ., Osaka, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.6, p.L376-8 (June 1983).
Electrical conductivity of $(CH)_x$ doped with various dopants like SF_6, C_2H_2, etc. which are usually not effective in increasing conductivity, is found to be enhanced by irradiation with the electron beam. These facts are tentatively ascribed either to the radiation induced complex formation, to the formation of cross-linking preserving the conjugated double bond scheme, or to the effective doping by the molecular fragments created by the decomposition of dopants by the electron beam irradiation. (8 refs.)

108397 Highly anisotropic conductive materials: polymers doped with crystalline charge-transfer complexes. L.Burda, A.Tracz, T.Pakula, J.Ulanski, M.Kryszewski (Polymer Inst., Tech. Univ. of Lodz, Lodz, Poland).
J. Phys. D (GB), vol.16, no.9, p.1737-40 (14 Sept. 1983).
A method of obtaining polymeric materials showing high anisotropy of electrical conductivity (up to 10^8) is reported. Electrical properties of polycarbonate films doped with TTT-TCNQ crystalline CT complex obtained using this method are discussed. (6 refs.)

108398 The impurity effect on the phase transitions in quasi-one-dimensional conductors. Ch.Seidel, V.N.Prigodin (A.F. Ioffe Physico-Tech. Inst., Acad. of Sci., Leningrad, USSR).
Phys. Status Solidi b (Germany), vol.118, no.2, p.713-24 (1 Aug. 1983).
Using bosonization and replica methods the influence of impurities on phase transitions in quasi-1D systems is studied within the framework of the 1D Fermi gas model. The random impurity potential is taken as a white-noise type. It is shown that nonmagnetic impurities suppress the dielectric transition but do not influence the superconducting state. Magnetic impurities suppress both the transitions, but the dielectric one considerably stronger than the superconductor one. Some special features occurring in the commensurate case are studied. Implications for organic 1D conductors are discussed. (20 refs.)

108399 Charge-density-wave-like transition in V_3Te_4. S.Anzai, S.Ohta, A.Yoshino, J.Nishio, M.Hatori (Faculty of Sci. & Technol., Keio Univ., Yokohama, Japan).
Phys. Status Solidi b (Germany), vol.118, no.2, p.K99-102 (1 Aug. 1983).
The charge-density-wave (CDW) states are favored in the poorly correlated electron systems, while the weakly correlated electrons stabilize the weak itinerant antiferromagnetisms. In order to study the poorly and the weakly correlated electron systems, the electrical resistivity, the Seebeck coefficient, and the magnetic susceptibility of V_3Te_4 are investigated. The authors find an electrical and magnetic transition in V_3Te_4 which is similar to that of 1T-VTe_2. (7 refs.)

108400 Low temperature metallic resistivity of the charge-transfer organic conductor $(TMTSF)_2PF_6$. S.K.Kyo (Sandia Nat. Labs., Albuquerque, NM, USA).
Solid State Commun. (USA), vol.47, no.4, p.247-50 (July 1983).
The electrical resistivity arising from electron-electron Umklapp scattering is calculated at low temperatures for the anisotropic but two-dimensional charge-transfer complex $(TMTSF)_2PF_6$. Also, the author considers a specular scattering correction to a recent one-phonon scattering mechanism and finds a significant change in the temperature dependent behavior of the resistivity. Finally an exact solution is obtained for the resistivity arising from two-libron scattering and is found to give a small contribution at low temperatures. Comparing these results with recent data, we find that the electron-electron mechanism yields the most satisfactory agreement at low temperatures, while contributions from the other two mechanisms may not be negligible at high temperatures. (18 refs.)

108401 Hysteresis in the electrical properties of orthorhombic tantalum trisulphide: evidence for an incommensurate-commensurate charge-density wave transition?. A.W.Higgs, J.C.Gill (H.H. Wills Phys. Lab., Bristol, England).
Solid State Commun. (USA), vol.47, no.9, p.737-42 (Sept. 1983).
A study of electrical conduction in orthorhombic TaS_3 has revealed the existence of thermal hysteresis throughout the temperature range 55K<205K. This is attributed to variability in the wavevector q of the charge-density wave (CDW) which develops below T_p=215K, and confirms the recent finding, from electron diffractions, that at temperatures not too far below T_p the CDW is incommensurate with the underlying lattice. Evidence that q becomes commensurate, at least along the chain direction at 55K, is provided by the vanishing of hysteresis at that temperature, and also by a rise in the threshold field for continuous motion of the CDW. From its dependence on temperature it is concluded that between T_p and 55K the conduction in the linear regime is better described as that of a Peierls semi-metal, rather than that of a Peierls intrinsic semiconductor. At most temperatures within that range electrical hysteresis also is observed, and a detailed study of this leads to the tentative conclusion that translation of the CDW conveys negative charge, carried presumably by negatively-charged discommensurations. The mechanisms of conduction below 55K remain uncertain. (18 refs.)

108402 Electron localization in 1D conductors due to the phonon scattering. A.A.Gogolin (L.D. Landau Inst. for Theoretical Phys., Moscow, USSR).
Solid State Commun. (USA), vol.47, no.9, p.753-7 (Sept. 1983).
Electron localization in 1D conductors due to scattering by dispersionless optical phonons at low temperatures has been studied by applying the Berezinsky diagram technique. The large localization length l_{loc}, much longer than the mean free path l, has been found. The low frequency optical absorption is described by the law: Re $\sigma(\omega) \sim \omega^2 |\ln^3 \omega|$. (9 refs.)

108403 On the metallic temperature dependence of the conductivity of doped polyacetylene. Wan Meixiang, Wang Ping, Cao Yong, Qian Renyuan (Inst. of Chem., Acad. Sinica, Beijing, China), Wang Fosong, Zhao Xiaojian, Gong Zhi.
Solid State Commun. (USA), vol.47, no.10, p.759-61 (Sept. 1983).
The true metallic temperature dependence of the conductivity of various doped polyacetylene films of both fibrillar and granular morphology has been experimentally demonstrated by voltage shorted compaction measurements. (11 refs.)

108404 Infrared conductivity from spin and charge density waves: $(TMTSF)_2X$. E.W.Fenton, G.C.Psaltakis (Div. of Phys., Nat. Res. Council of Canada, Ottawa, Ontario, Canada).
Solid State Commun. (USA), vol.47, no.10, p.767-72 (Sept. 1983).
Infrared conductivity from an incommensurate spin density wave occurs due to even-order charge density wave harmonics which interact with the host lattice. Phonon states within the density-wave-induced energy gap for single-particle excitations lead to conductivity much different from that of an incommensurate charge density wave including counter-ion ordering. The conductivity expected for relaxed and quenched states of $(TMSF)_2ClO_4$ is discussed. (11 refs.)

108405 The appearance of the many-body resonance at the Fermi level in Kondo-lattices. F.G.Aliev, N.B.Brandt, V.V.Moschalkov, S.M.Chudinov (Low Temperature Phys. Lab., Moscow State Univ., Moscow, USSR).
Solid State Commun. (USA), vol.47, no.9, p.693-7 (Sept. 1983).
Studying transport and magnetic properties of solid solutions $Ce_xLa_{1-x}Cu_2Si_2$ $(0 \leq x \leq 1)$ and using for $CeCu_2Si_2$ pressure p as an external parameter, the authors have observed the continuous transition from Kondo-impurity regime $(x \ll 1)$ to Kondo lattice $(x \simeq 1,\ p=0,\ \nu_{Ce} \approx 3+)$ and then through the intermediate valence state $(x=1,\ 0<p<p_0 \neq 0,\ 3+<\nu_{Ce}<4+)$ to metal with $\nu_{Ce} \simeq 4+$. They have found that all the anomalous properties of Kondo-lattices ($CeCu_2Si_2$, $CeAl_3$, $CeAl_2$) are caused by the appearance at the Fermi level of the many-body resonance of Abrikosov-Suhl type. 108406 Acoustic and optical-phonon-limited mobilities in *p*-type silicon within the deformation-potential theory. F.Szmulowicz (Univ. of Dayton Res. Inst., Dayton, OH, USA).
Appl. Phys. Lett. (USA), vol.43, no.5, p.485-7 (1 Sept. 1983).
The deformation-potential theory of Bir and Pikus (1961), for the hole-optical phonon scattering, has been extended for the treatment of nonparabolic bands and combined with the theory of Tiersten (1961, 1964) for the hole-acoustic phonon scattering, to calculate phonon-limited mobilities in *p*-type silicon. The mobilities were calculated without the relaxation-time approximation from solutions of the full Boltzmann equation, with accurate hole wave functions and valence-band dispersions. Only the hole-optical phonon deformation-potential parameter was adjusted to yield agreement with transport data at room temperature; other experimental input was fixed. This represents the first such calculation for silicon. The conductivity and Hall mobilities, and the Hall factor, are in very good agreement with most of the available experimental data. The agreement between experiment and theory is significantly better than that attained by earlier calculations. (28 refs.)

108407 Electron mobility of high purity VPE-GaAs and LPE-GaAs. Xu Shouding, Li Ruiyun (Inst. of Semiconductors, Acad. Sinica, Beijing, China).
Chin. J. Semicond. (China), vol.4, no.4, p.389-94 (July 1983). In Chinese.
Electrical properties of high purity VPE-GaAs and LPE-GaAs have been measured by using Van der Pauw method at a temperature range of 20K to 300K, their scattering mechanism has also been analysed. The highest peak mobility obtained in the laboratory is 3.76×10^5 cm^2/V.s for VPE-GaAs and 2.54×10^5 cm^2/V.s for LPE-GaAs respectively. (5 refs.)

108408 Z-type jump in electrical conductivity of samarium manganite. N.Kamegashira, Y.Miyazaki, H.Suzuki (Dept. of Materials Sci., Toyohashi Univ. of Technol., Toyohashi, Japan).
Mater. Lett. (Netherlands), vol.2, no.1, p.56-8 (July 1983).
The electrical conductivities of non-stoichiometric samarium manganites were measured as a function of temperature and the existence of a Z-type jump in the conductivity curve was found near 1300K, and a heat anomaly was also observed by differential thermal analysis, which should reflect the same phase transition as in $LaMnO_3$. (11 refs.)

108409 Transport properties of amorphous silicon films on quartz substrate. B.Chakrabarti, S.Chaudhuri, A.K.Pal (Dept. of General Phys. & X-rays, Indian Association for the Cultivation of Sci., Calcutta, India).
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.903-7 (June 1983).
Electrical conductivity and thermoelectric power of vacuum evaporated a-Si films deposited onto a quartz substrate were measured in-situ at a system pressure $\sim 10^{-6}$ Torr. Data were analysed with the well known Mott's relations and it was observed that conduction is governed by variable range hopping in the lower temperature region and by carriers excited into the localised states at the band edges at high temperatures. (27 refs.)

108410 Electrical resistivity of undoped GaAs single crystals grown by magnetic field applied LEC technique. K.Tersashima, T.Katsumata, F.Orito, T.Kikuta, T.Fukuda (Optoelectronics Joint Res. Lab., Kawasaki, Japan).

Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.6, p.L325-7 (June 1983).

The authors have grown undoped GaAs single crystals by the magnetic field applied LEC (MLEC) technique and measured their electrical and optical properties. The most striking result was that the electrical resistivity of undoped GaAs changed from being semi-insulating (10^8 ohm-cm) to semiconducting (10 ohm-cm) by increasing the magnetic field (0 to 1300 Oe). PL, DLTS and SIMS measurements suggest that the decrease of resistivity is mainly due to the decrease in concentration of the deep level defects. (14 refs.)

108411 Electron tunneling and hopping possibilities in RuO_2 thick films. N.C.Halder (Dept. of Phys., Univ. of South Florida, Tampa, FL, USA).

Electrocompon. Sci. & Technol. (GB), vol.11, no.1, p.21-34 (1983).

Proposes that the temperature coefficient of resistivity (TCR) in thick film resistors arises from (i) the usual particle-to-particle conduction, (ii) electron tunneling and (iii) the phonon-assisted hopping. Equations for activation energies are derived for the temperature minimum of the resistance with and without hopping. New equations for TCR are suggested. Some extensive calculations of TCR and activation energy have been made for RuO_2 thick film resistors, the results of which agree well with available experimental measurements. (15 refs.)

108412 The influence of annealing on the resistivity of irradiated n-GaP samples. S.A.Airapetyan, S.K.Nikogosyan, V.A.Saakyan, A.S.Saroyan.

Izv. Akad. Nauk Arm. SSR Fiz. (USSR), vol.17, no.1, p.36-9 (1982). In Russian.

The space charge of disordered regions formed during electron irradiation of *n-GaP* samples modulates the energy zone edges. As a result, the rise of specific resistivity for annealed (above 600°C) samples at low temperatures is moderated. (3 refs.)

108413 Electrical conductivity of transition metal oxide glasses in the system V_2O_5-B_2O_3-TeO_2 at high temperatures. V.G.Dixit, K.Singh (Dept. of Phys., Nagpur Univ., Nagpur, India).

J. Phys. & Chem. Solids (GB), vol.44, no.9, p.859-64 (1983).

Bulk DC conductivities of the electronically conducting transition metal oxide glasses in the system xV_2O_5-$50B_2O_3$-$(50\text{-}x)TeO_2$ were measured at different temperatures in the range 310-623K. The dependence of conductivity on composition is explained on the basis of the role of TeO_2 as a modifier or impurity. The observed kink in the log σ vs. $1/T$ characteristic of the glasses is interpreted as being due to switching over of the conduction mechanism from one type to the other. The activation energies are fitted in a linear relation of the type $E_g=A-BP$, where A and B are constants and P, the composition parameter. Comparing the results obtained with those of previous workers in the V_2O_5-P_2O_5 and V_2O_5-B_2O_3 systems, a physical analysis is presented. (22 refs.)

108414 Dark conductivity in amorphous undoped silicon film. V.Augelli, R.Murri (Dipartimento di Fisica, Bari, Italy).

J. Non-Cryst. Solids (Netherlands), vol.57, no.2, p.225-40 (1 Sept. 1983).

The temperature dependence of the dark conductivity was investigated in amorphous undoped silicon films deposited by glow-discharge in a $SiCl_4$-H_2 mixture. Differential transport processes were identified according to the investigated temperature range. The dependence of the dark conductivity was also examined as a function of some deposition parameters. The experimental results are discussed in terms of the two-phase structure of the film. (42 refs.)

108415 On the mobility dip in polycrystalline silicon. C.H.Ling (Dept. of Electrical Engng., Nat. Univ. of Singapore, Singapore).

J. Phys. D (GB), vol.16, no.9, p.L181-4 (14 Sept. 1983).

Measured Hall mobility in polycrystalline silicon layers shows a minimum at a certain doping concentration. This is interpreted in terms of the decrease in conductivity rather than a decrease in inherent mobility in the grain boundary space charge-region. The inherent mobility is suggested to be about the same as in the surrounding neutral region. (8 refs.)

108416 Photoelectronic properties of Cu_3PS_4 and Cu_3PS_3Se single crystals. J.V.Marzik, A.K.Hsieh, K.Dwight, A.Wold (Dept. of Chem., Brown Univ., Providence, RI, USA).

J. Solid State Chem. (USA), vol.49, no.1, p.43-50 (Aug. 1983).

Single crystals of Cu_3PS_4 and Cu_3PS_3Se grown by chemical vapor transport were shown to be diamagnetic p-type semiconductors. Electrical measurements showed room temperature resistivities ranging from 1 to 5 ohm-cm and carrier concentrations of 10^{17} cm^{-3}. Both materials were shown to be active as cathodes for the photoelectrolysis of water. Spectral response measurements show that substitution of selenium for sulfur lowers the optical band gap from 2.38(5) eV for Cu_3PS_4 to 2.06(4) eV for Cu_3PS_3Se. (20 refs.)

108417 Electrical transport properties of GaAs and AlAs mixed crystals for semiconductor devices. A.K.Saxena (Dept. of Electronics & Communication Engng., Univ. of Roorkee, Roorkee, India).

J. Inst. Electron. & Telecommun. Eng. (India), vol.29, no.3, p.97-107 (March 1983). [received: Aug. 1983]

Proposes a three-level Γ, L, X conduction band structure for $Ga_{1-x}Al_xAs$ alloys with the first direct (Γ) indirect (X) minima cross-over occurring at $x=0.43$. The sub-band energy gaps between the Γ-L and Γ-X minima in GaAs were determined to be 0.285 and 0.485 eV, respectively (in contradiction to the accepted value of 0.36 eV) and a two-level model for the conduction band structure. The deep energy levels are present in the alloys and were found to be strongly coupled to the indirect minima even for the alloy compositions for which the direct energy Γ minimum is the lowest in energy. The various scattering mechanisms and their relative magnitudes in the various minima were determined together with the various scattering parameters for the three minima. In addition to optical and microwave devices, the $Ga_{1-x}Al_xAs$ material should also prove useful for pressure sensor, current limiting and switching devices. (76 refs.)

108418 Many-electron hopping. P.Gosar (Dept. of Phys., E. Kardelj Univ. of Ljubljana, Ljubljana, Yugoslavia).

Phys. Status Solidi b (Germany), vol.118, no.2, p.853-60 (1 Aug. 1983).

Correlated hopping of many electrons in the impurity band of the moderately compensated semiconductor is studied. The calculation of the n-electron cluster transition rate is based on the following assumptions: the one-electron states in the impurity band are strongly localized, the motion of each electron is restricted to the hopping between low impurity sites, the electrons mutually interact by Coulomb forces, and the deformation-potential-type coupling to phonons is used. A statistical approach is applied in the calculation of transition rates for very large clusters. (5 refs.)

108419 Electrical properties of $CuGaTe_2$. S.M.Wasim, G.Marcano, G.Sanchez Perez (Dept. de Fisica, Univ. de Los Andes, Merida, Venezuela).

Phys. Status Solidi a (Germany), vol.78, no.2, p.423-30 (16 Aug. 1983).

A systematic study in made on the effects of annealing $CuGaTe_2$ single crystals in vacuum, under reduced pressure, and in the presence of Gd and Zn. From the variation of hole concentration with temperature, the acceptor state ionization energy is found to lie between 18 and 37 meV. This energy state is associated with a Ga vacancy. There is some indication that Zn acts as donor in this compound. The mobility data are explained by taking into account the scattering of the charge carriers by ionized and neutral impurities, acoustic-mode phonons, and space charge effects. The valence-band deformation potential is found to be 4.32 eV. (23 refs.)

108420 Radiation-induced conductivity in polyethylene. A.P.Tyutnev, V.S.Saenko (Moscow Inst. of Electronic Machine Building, Moscow, USSR), A.V.Vannikov, G.S.Mingaleev.

Phys. Status Solidi a (Germany), vol.78, no.2, p.689-96 (16 Aug. 1983).

The radiation-induced conductivity of PE is studied under varying irradiation conditions: pulse length 5 μs to 1 ms, dose rate 10^4 to 2×10^7 Gy/s, dose per pulse 1 to 10^4 Gy including continuous excitation. The bias field is varied in the 4×10^6 to 2×10^8 V/m range. Tests are made in vacuum (3×10^{-3} Pa) at room temperature. At short pulses of irradiation (≤1 ms) the conductivity is attributed to geminate electrons undergoing dispersive transport whereas at longer times free carriers predominate. The geminate recombination is estimated to be almost complete in roughly 0.1 to 1 s at room temperature. No polarization phenomena can be detected in PE under irradiation. (25 refs.)

108421 Electrical conductivity of $Li_{16-2x}Zn_x(GeO_4)_4$. P.Kurek, W.Bogusz (Inst. of Phys., Warsaw Tech. Univ., Warsaw, Poland).

Phys. Status Solidi a (Germany), vol.78, no.2, p.K117-19 (16 Aug. 1983).

The formula $Li_{16-2x}Zn_x(GeO_4)_4$ where $0<X<4$ describes the family of solid solutions between Li_4GeO_4 and Li_2ZnGeO_4. The authors report an investigation of the electrical conductivity of compounds characterized by $x=0.5$, 1.0, 1.25, 1.5, and 2.0. Their electrical properties were determined by means of admittance spectroscopy. (8 refs.)

108422 Drift mobility measurements on single crystals of orthorhombic benzophenone using the electron bombardment technique. M.Saleh (Dept. of Phys., Univ. of Nairobi, Nairobi, Kenya).

Phys. Status Solidi a (Germany), vol.78, no.2, p.K137-40 (16 Aug. 1983).

The work reported is aimed at studying the temperature dependence of carrier mobilities in single crystals of orthorhombic benzophenone in the temperature range $160K\leq T\leq300K$, using the electron bombardment technique, and to obtain evidence which might assist in the identification of the charge carrier transport mechanisms for such type of crystals. (10 refs.)

108423 Effect of ytterbium on the electrophysical properties of Ga_2Se_3 single crystals. B.G.Tagiev, G.M.Niftiev, G.K.Aslanov, I.M.Askerov, F.N.Sultanov (Inst. of Phys., Acad. of Sci., Azerbaidzhan SSR).

Phys. Status Solidi a (Germany), vol.78, no.2, p.K189-93 (16 Aug. 1983).

Gives the results of investigations of the temperature dependences of electric conductivity (σ(T)), the current-voltage characteristics, and the thermostimulated depolarization currents of Ga_2Se_3 single crystals doped with ytterbium (Yb) over wide ranges of temperatures (140 to 410K) and electric fields (10 to 5×10^4V/cm). (10 refs.)

108424 Surface effects in semiconductors in contact with liquids deduced from conductivity and Hall coefficient measurements. M.Petrescu (Inst. de Constructii, Bucuresti, Rumania), N.Gherbanovschi.

Stud. & Cercet. Fiz. (Rumania), vol.35, no.7, p.671-8 (1983). In Rumanian.

Conductivity and Hall coefficient measurements, on high resistivity germanium samples, with adequate geometries, explain surface effects in some dielectric liquids, at various temperatures. These effects have an influence on the behaviour, in such mediums, of semiconductor devices with geometries which emphasize the part of the surface in comparison with the volume. (11 refs.)

108425 An efficient numerical scheme for spreading resistance calculations based on the variational method. S.C.Choo, M.S.Leong, J.H.Sim (Dept. of Electrical Engng., Nat. Univ. of Singapore, Singapore).

Solid-State Electron. (GB), vol.26, no.8, p.723-30 (Aug. 1983).

The authors present a simple and efficient numerical scheme for evaluating the correction factor integrals that arise in the variational method. The scheme is a modification of one recently proposed by Berkowitz and Lux (see J. Electrochem. Soc., vol.128, p.1137, 1981) for the uniform flux method. The abscissae and the weights required for the integration are given in a form which allows the numerical scheme to be readily implemented. Using this scheme it takes, on an average, 0.8 sec to compute one value of correction factor on an Apple II microcomputer. For a slab of varying thickness, backed by either a perfectly conducting or a high resistivity substrate, the correction factors obtained agree with those derived from the exact constant-potential method to within 1%. (13 refs.)

108426 Damaged-induced isolation in *n*-type InP by light-ion implantation. P.E.Thompson, S.C.Binari, H.B.Dietrich (Naval Res. Lab., Washington, DC, USA).

Solid-State Electron. (GB), vol.26, no.8, p.805-10 (Aug. 1983).

A detailed study of the insulating properties of ion-implantation induced damage in InP has been carried out for H, He, B and Be implantation. For each ion, there was found to be an optimal implantation fluence for the formation of resistive layers. At this fluence, a maximum resistivity of 10^3 to 10^4 Ω.cm was observed. Lower resistivities were observed for higher and lower implantation fluences. The primary anneal stage for the maximum resistivity layers was between 250 and 300°C. Anomalous results were observed for H implantation in that the resistivity observed depends on the test structure geometry. Measurements carried out by contacting the front and back of the damage layer gave resistivity values two orders of magnitude greater than those measured by contacting adjacent points on an epitaxial structure. For all other ions, the results obtained for the two geometries were in good agreement. It has been shown that a conductive layer produced by the proton bombardment of the underlying Fe-doped substrate gives rise to a low resistance shunt in the epitaxial study. (6 refs.)

108427 On electrical transport in non-isothermal semi-conductors. J.M.Dorkel (Inst. Nat. des Sci. Appliquees de Toulouse, Toulouse, France).

Solid-State Electron. (GB), vol.26, no.8, p.819-21 (Aug. 1983).

The analysis of transport mechanisms in a non-isothermal semiconductor is today of growing interest in the modelling of power devices. In 1972 Stratton proposed an expression of the electron current which can serve as the basis of a non-isothermal device model. In particular he demonstrated that the expression of the current contained a supplementary term linked to the presence of a temperature gradient in the structure. This supplementary term led to the definition of a thermal diffusion coefficient of the carriers which, like the mobility and the classical diffusion constant, is linked to the scattering mechanisms to which the carriers are subjected. In his analysis Stratton gave an explicit form of this thermal diffusion coefficient in the particular case of the dominance of the lattice-scattering mechanism. The present paper proposes a calculation method for this thermal diffusion coefficient, applicable to the more general case where the lattice scattering and the ionized impurity scattering mechanisms are equally significant. (5 refs.)

108428 Fundamental models of electronic transport in amorphous semiconductors. D.Emin.
Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.2-3, p.303-14 (1983). In English. (Otto-Schott-Colloquium on the State of Optical Glass Research 1982, Jena, Germany, 1982).
Electronic excitations in condensed matter are either quasifree or self-trap. This fundamental dichotomy results in two distinct models for electronic carriers in amorphous semiconductors. In one the predominant charge carriers behave as quasifree particles; in the other they form small polarons and move by small-polaronic hopping. The salient features of the electronic transport arising from the high-mobility (Mott-CFO) model and the small-polaron model are contrasted. While some amorphous semiconductors support high-mobility transport many of the commonly studied materials (e.g. chalcogenide glasses) display small-polaron transport. (46 refs.)

72.20H High-field and nonlinear effects

108429 A study of the transformations between stationary and transit domains in a Gunn device. Wang Shouwu, Zheng Yiyang, Xi Xiaolin, Zhang Jinchang (Inst. of Semiconductors, Acad. Sinica, Beijing, China).
Chin. J. Semicond. (China), vol.4, no.4, p.321-33 (July 1983). In Chinese.
The transformations between stationary and transit domains in a Gunn device which has a n^+-n-n^+ structure with a doping gradient near the anode are investigated. Experimental observation and computer simulation are carried out. When the domain reaches the anode, it stops and become a quasi-stationary domain, and the field outside the domain reaches its maximum value. If the bias voltage is not high enough to cause a new domain to be created at the notch near the cathode, the quasi-stationary domain readjusts itself to become a real stationary domain, while the field outside the domain will decrease to a fixed value, which is independent of the bias voltage. Theoretical analysis has been carried out and an analytical relationship between the field outside the domain for real stationary domains and the doping density in the active region of the device is obtained. (14 refs.)

108430 High-field transport properties of $In_{0.765}Ga_{0.235}As_{0.5}P_{0.5}$. M.Deb Roy (Phys. Dept., Jadavpur Univ., Calcutta, India), B.R.Nag, D.Chattopadhyay.
Appl. Phys. A (Germany), vol.A32, no.1, p.39-43 (Sept. 1983).
Monte-Carlo results on the velocity-field characteristics, AC diffusion-constant and thermal-noise voltages are presented for $In_{0.765}Ga_{0.235}As_{0.5}P_{0.5}$ at 300K. Recently available values of physical constants have been used in the calculations. The values of diffusion constants are close to those of InP but the thermal noise voltages are found to increase faster with the field. The peak velocity is 1.9×10^7 cm/s and the threshold field for negative differential mobility is about 6 kV/cm. (19 refs.)

108431 Effect of optical-phonon scattering on the energy distribution of hot electrons in semiconductors at low temperature. E.F.El-Wahidy, L.Abou El-Nasr (Dept. of Phys., Alexandria Univ., Alexandria, Egypt).
Nuovo Cimento D (Italy), vol.2D, ser.1, no.4, p.1175-86 (July-Aug. 1983).
The variational method is used in finding the solution of the transport equation for a system of hot electrons in *n*-Ge at $T=20$K in the presence of high electric field. The role of the emission of optical phonons by hot electrons together with the effect of electron capture by repulsive centres on the formulation of the distribution function are studied. It is shown that the emission of optical phonons plays a dominant role in the formulation of the distribution. The influence of electron capture is very small, it may become appreciable at higher trap concentrations. The obtained distribution function is then used in calculating the capture rate of electrons by negatively charged centres. It is shown that the capture rate increases with electric field. (10 refs.)

108432 High-field unipolar charge injection into insulators of various geometries. L.S.Miller, R.Kershaw (Dept. of Materials & Energy Sci., Coventry Polytech., Coventry, England).
J. Phys. D (GB), vol.16, no.9, p.1749-54 (14 Sept. 1983).
Single carrier space-charge-influenced effects (for non-zero injection fields) are considered. Initial, transient, and DC currents are derived analytically. The transient problem is solved only for planar samples. The transient current shows the normal space-charge-limited (SCL) form even for space-charge-free conditions. For fixed non-zero injection fields a sharp rise of current with voltage above the 'switch-on' voltage (V_I) gives way to the normal SCL square-law for $V \gtrsim 5\ V_I$. The 'zero-time' current-voltage curve is universal in form for the simple geometries. For Schottky injection, the initial rise with voltage is less rapid; both cases could readily be misinterpreted as due to a trap-filled limit. (7 refs.)

108433 Nonlinear oscillations and chaos in electrical breakdown in Ge. S.W.Teitsworth, R.M.Westervelt (Dept. of Phys., Harvard Univ., Cambridge, MA, USA), E.E.Haller.
Phys. Rev. Lett. (USA), vol.51, no.9, p.825-28 (29 Aug. 1983).
Self-generated nonlinear oscillations and chaos are found in the conductance of liquid-He-cooled far-infrared photoconductors made from ultrapure Ge. Complex behavior includes a period-doubling cascade to chaotic oscillation with increasing applied electric field, quasiperiodic oscillation, frequency locking, and intermittent switching between modes of oscillation. A rate-equation model is presented which includes impurity impact ionization and space-charge injection. (16 refs.)

108434 Correlation functions for high-field transport in semiconductors. J.J.Niez, K.-S.Yi, D.K.Ferry (Dept. of Electrical Engng., Colorado State Univ., Fort Collins, CO, USA).
Phys. Rev. B (USA), vol.28, no.4, p.1988-96 (15 Aug. 1983).
The relevant correlation functions for the differential mobility and the diffusion cofficient are developed here for the far-from-equilibrium steady state appropriate to high-field transport in semiconductors. The authors present a unified analysis for the evolution of several generic correlation functions related to this steady state. They emphasize the initial values and the temporal evolution of these functions. (35 refs.)

72.20J Charge carriers: generation, recombination, lifetime, and trapping

108435 Spin dependent trapping in a polycrystalline silicon integrated circuit resistor. W.K.Schubert, P.M.Lenahan (Sandia Nat. Labs., Albuquerque, NM, USA).
Appl. Phys. Lett. (USA), vol.43, no.5, p.497-9 (1 Sept. 1983).
Spin dependent trapping of majority carriers at trivalent silicon centers in the grain boundaries of a polycrystalline silicon integrated circuit resistor has been observed. The phenomenon has been studied both in a silicon bicrystal and in thin-film polycrystalline silicon with essentially identical results. This not only identifies the trapping center responsible for the large barriers observed at silicon grain boundaries, but also demonstrates that the technique has the sensitivity required to work with actual microelectronic devices. (10 refs.)

108436 A note on the nature of two recombination centres in indium antimonide. S.Qing, Z.Yuanxi, S.Weiying (Shanghai Inst. of Metall., Acad. Sinica, Shanghai, China).
Mater. Lett. (Netherlands), vol.2, no.1, p.79-80 (July 1983).
The probable nature of the two recombination centres commonly found in InSb (E_v+0.071 eV, E_v+0.11 eV) is discussed. By assuming certain interactions among defects and impurities in InSb, it is postulated that $V_{In}O_iV_{In}$ and Sb_{In} could tentatively be assigned to the said centres respectively. (11 refs.)

108437 Mobilities of electrons and holes in naphthalene and perdeuterated naphthalene. L.B.Schein, W.Warta (Xerox Corp., Webster Res. Center, Rochester, NY, USA), A.R.McGhie, N.Karl.
Chem. Phys. Lett. (Netherlands), vol.100, no.1, p.34-6 (26 Aug. 1983).
Charge carrier mobilities are presented over a wide temperature range (77-300K) for electrons and holes in naphthalene and perdeuterated naphthalene for the *a*, *b*, and *c′* crystallographic directions. Consideration is given to the implications of the observed deuteration effects on the validity of band and hopping models in these materials. (5 refs.)

108438 Electric-field-independent electron mobilities in anthracene. L.B.Schein, R.S.Narang, R.W.Anderson, K.E.Meyer (Xerox Corp., Webster Research Center, Rochester, NY, USA), A.R.McGhie.
Chem. Phys. Lett. (Netherlands), vol.100, no.1, p.37-40 (26 Aug. 1983).
It is experimentally shown that the electron drift mobility in the *c′* direction of anthracene is independent of the electric field up to 28 V/μm at 140K. These data provide a challenge to theories of charge transport which must account for both a temperature-independent and an electric-field-independent (to 28 V/μm) drift mobility. (16 refs.)

108439 Contactless measurement of photoinduced carrier lifetime and injection level in silicon wafer using additional eddy current. T.Maekawa, S.Inoue (Dept. of Electronics, Chiba Inst. of Technol., Chiba, Japan), A.Usami.
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.968-74 (June 1983).
A new contactless method for measuring the lifetime and the injection level of photoinduced excess carriers in a silicon wafer is described. In order for the measuring current to flow in the wafer, a pair of high frequency magnetic fluxes in opposite directions is used so as to concentrate the induced eddy current in the central part even for narrow wafers. The voltage in the wafer caused by eddy current and the photoconductivity are analyzed, and it is shown that the injection level of excess carriers can be calculated from the relation between the above voltage and lifetime measured for different illumination intensities. The dependence of lifetime on the injection level for NTD Si and normally doped n-C.Z Si wafers are found to be considerably different. The measurement sensitivity and the spatial resolution of this method are discussed. (19 refs.)

108440 Deep electron traps in undoped semi-insulating GaAs grown by the liquid encapsulated Czochralski method. Y.Imamura, J.Osaka (Atsugi Electrical Communication Labs., Nippon Telegraph & Telephone Public Corp., Kanagawa, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.6, p.L333-5 (June 1983).
Semi-insulating undoped GaAs grown by the liquid encapsulated Czochralski (LEC) method has been studied on deep traps using the photocurrent method, Hall effect measurements and the thermally stimulated current method. Obvious differences in the photocurrent spectra and the thermal activation energy for carrier density have been observed between crystals grown from Ga rich melt and As rich melt, in spite of either high resistivity or n-type properties. The reason is conceived to be the existence of two kinds of deep trap: approximate levels from the conduction band are 0.72 eV for Ga rich melt, and 0.86 eV for As rich melt. (5 refs.)

108441 Analysis of the recombination properties of Si heat treated under the conditions obtaining in the production of semiconductor instruments. V.I.Alekseenko, N.M.Litovchenko, N.M.Bondar', Yu.P.Medvedev.
Optoelektron. & Poluprovodn. Tekh. (USSR), no.1, p.57-61 (1982). In Russian.
The change in lifetime of minority current carriers under various conditions of heat treatment is studied using industrial dislocation-free electronic Si ingots of large diameter (i.e. $d \simeq 60$ mm) doped with P, of specific resistance 4-5 Ohm.cm, with the spread of the specific resistance not exceeding 10%. The maximum decrease in hole lifetime t_h is observed, as would be expected, during oxidative cycles (generally 1000-1150°C), and the magnitude of t_h depends on the temperature and the duration of the oxidative cycle, which can be explained in terms of diffusion of impurities from the surface, these being effective recombination centres. Speaking generally, the change in t_h should be determined only by the heat treatment conditions and should not depend on the properties of the initial starting material, i.e. t_h should be about the same for all ingots subjected to the same heat treatment, which does not happen in practice, and in fact during heat treatment different concentrations of recombination centres are established, which can be explained in terms of internal gettering together with diffusion impurities. (14 refs.) *N.F.S.*

108442 The effect of cure on thermally stimulated discharge measurements in epoxy resin coatings. J.H.Daly, L.Bunton, R.A.Pethrick (Dept. of Pure & Appl. Chem., Univ. of Strathclyde, Glasgow, Scotland).
J. Mater. Sci. (GB), vol.18, no.9, p.2817-25 (Sept. 1983).
Thermally stimulated discharge (TSD) measurements are reported as a function of the degree of cure for a series of dicyandiamide cured powder epoxy resins. Data are presented on the effects of ageing and water uptake on the TSD traces. The observed effects are interpretated in terms of the generation of traps, creation of voids and changes in the bulk conductivity on the charge mobility. The TSD data are compared with dynamic mechanical analysis (DMA) and differential scanning calorimetry (DSC) observations on these systems. These studies indicate that the method is very sensitive to changes in the state of the coating and has potential as a test method for the characterization of epoxy resin coatings. (17 refs.)

108443 Many-electron hopping in semiconductors. P.Gosar (Dept. of Phys., E. Kardelj Univ., of Ljubljana, Ljubljana, Yugoslavia).
Physica A (Netherlands), vol.120A, no.1-2, p.339-50 (1983).
Correlated hopping of many electrons in the impurity band of moderately compensated semiconductors at low temperature is studied. The growth of the electric dipole moment of the n-electron cluster after the adiabatic switch on of the electron-phonon interaction and the external electric field is calculated. One- and two-phonon processes are considered. The theory is based on the following assumptions: one-electron states in the impurity band are strongly localized, the motion of each electron is restricted to the hopping between two impurity sites, the Coulomb interaction between electrons in the cluster is strong, and the deformation potential type coupling to phonons is assumed. It is shown that the exchange of virtual phonons during the hopping events results in the renormalization of the transfer matrix elements. The calculation also reveals an interference effect between the contributions of different electrons to the current. (3 refs.)

108444 Femtosecond relaxation of photoexcited nonequilibrium carriers in $Al_xGa_{1-x}As$. C.L.Tang, D.J.Erskine (Cornell Univ., Ithaca, NY, USA).
Phys. Rev. Lett. (USA), vol.51, no.9, p.840-3 (29 Aug. 1983).
Optical saturation of highly excited states in the conduction band of a semiconductor and the subsequent extremely fast energy relaxation due to carrier-carrier and optical-phonon scattering at room temperature are observed. The corresponding measured life-time for states 160 meV above the band edge in $Al_{0.34}Ga_{0.66}As$ is in the range of 80 to 30 fs depending upon the photoexcited carrier density. (12 refs.)

108445 Free-carrier absorption in n-PbSe at low temperatures due to eectron-electron scattering. N.Van Huong (Inst. of Theoretical Phys., Warsaw Univ., Warsaw, Poland).
Phys. Status Solidi b (Germany), vol.118, no.2, p.631-40 (1 Aug. 1983).
Free-carrier absorption due to the electron-electron interaction in strongly degenerate n-PbSe in calculated using the theory developed in a previous paper. This theory is specified for the case of a weakly anisotropic conduction band. Numerical results for the free-carrier absorption are compared with those corresponding to other electron scattering processes, and with experimental data on this material at 30K. (8 refs.)

108446 Effect of crystal-field splitting on the Einstein relation in tetragonal semiconductors. A.N.Chakravarti, K.P.Ghatak, K.K.Ghosh, H.M.Mukherjee (Inst. of Radio Phys. & Electronics, Univ. Coll. of Sci. & Technol., Calcutta, India).
Phys. Status Solidi b (Germany), vol.118, no.2, p.843-52 (1 Aug. 1983).
An attempt is made to study the effect of crystal-field splitting on the Einstein relation for the diffusivity-mobility ratio of the carriers in tetragonal semiconductors, taking inherently degenerate n-Cd_3As_2 as an example. It is found on the basis of the Bodnar model, which has recently been demonstrated in the literature to be the most valid model for Cd_3As_2, that the above ratio increases with increasing carrier concentration as expected for degenerate semiconductors. It is also shown that the tetragonal crystal-field effectively reduces the ratio with increasing amount of reduction with increasing carrier concentration. (22 refs.)

108447 Recombination and trapping levels in GaS:Mn single crystals. B.G.Tagiev, G.M.Niftiev, S.A.Abushov (Inst. of Phys., Acad. of Sci., Baku, Azerbaidzhan SSR).
Phys. Status Solidi a (Germany), vol.78, no.2, p.K183-7 (16 Aug. 1983).
Determines the parameters of recombination centres and traps in GaS:Mn by the methods of current-voltage characteristics, thermostimulated conductivity, and temperature dependences of photocurrent and dark current. (13 refs.)

108448 Thermally stimulated depolarization effect in thiourea-formaldehyde condensate. H.S.Nalwa, P.Vasudevan (Dept. of Chem., Indian Inst. of Technol., New Delhi, India).
Polymer (GB), vol.24, no.9, p.1197-8 (Sept. 1983).
A thiourea-formaldehyde condensate was synthesized in an acid medium and characterized by elemental analysis, infrared spectroscopy, and thermal methods of analysis. The thermally stimulated depolarization effect was studied in samples polarized under different conditions. The results indicate two distinct transitions in the temperature ranges 94-100°C and 122-126°C. The polarization-depolarization phenomena were correlated with the physicochemical changes occurring in the matrix. Depolarization kinetics data such as activation energy and relaxation times of the electrets are reported. (20 refs.)

108449 Enhancement of Auger recombination in semiconductors by electron-hole plasma interactions. M.Takeshima (Semiconductor Lab., Matsushita Electronics Corp., Osaka, Japan).
Phys. Rev. B (USA), vol.28, no.4, p.2039-48 (15 Aug. 1983).
It is shown that electron-hole plasma interaction has a very important effect on band-to-band Auger recombination in semiconductors. The effect is an enhancement, by a factor of about 5, of the Auger recombination rate as compared to the value calculated with the neglect of the electron-hole plasma interaction. Quantitative agreements between theories and experiments in a number of previous papers are fortuitous as a result of overestimation of overlap integrals. By careful estimation of overlap integrals the present theory gives a satisfactory explanation of experiments. (33 refs.)

108450 A study of the conduction and thermostimulated polarization currents in single crystals of Ca-Ga-Ge and Gd-Ga garnets. A.E.Nosenko, V.N.Shevchuk, V.V.Kravchishin.
Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1229-33 (Aug. 1983). In Russian.
Currents of thermostimulated polarization of Ca-Ga-Ge garnet single crystals and conduction currents of Ca-Ga-Ge and Gd-Ga garnets are studied at DC in vacuum of $\sim 10^{-5}$ mm Hg within 170-500K. It is shown that the polarization effects are substantial within 200-410K. At a temperature of about 410K and higher the current through a sample is determined by equilibrium conduction. (11 refs.)

72.20M Galvanomagnetic and other magnetotransport effects

108451 Galvanomagnetic and thermoelectric properties of p-$Pb_{1-x}Ge_xTe$ in a 80-300K temperature range. V.L.Vassilev, S.K.Dimitrova (Faculty of Phys., Sofia Univ., Sofia, Bulgaria).
C.R. Acad. Bulg. Sci. (Bulgaria), vol.36, no.5, p.587-9 (1983).
In recent years there has been a growing interest in the system of semiconductor solid solutions lead-telluride-germanium telluride, which is connected with their practical application (lasers and detectors in the IR region, thermoelectric generators), as well as with the observed phase transition Fm3m-R3m, whose temperature can be changed gradually by introducing germanium telluride in lead telluride from 0 to 700K. The paper deals with some preliminary investigations of the specific electroconductivity, the coefficient of thermo-electric power, the Hall effect and the transverse Nernst-Ettingshausen effect for p-type polycrystalline specimens of $Pb_{1-x}Ge_xTe$ for compositions with $x \leq 0.18$. (5 refs.)

108452 High temperature oscillations of magnetoresistance in bismuth and semimetallic BiSb alloys. Yu.A.Bogod, Vit.B.Krasovitskii, E.T.Lemeshevskaya.
Fiz. Nizk. Temp. (USSR), vol.9, no.8, p.832-44 (Aug. 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The electric conductivity, magnetic resistance, Shubnikov-de Haas oscillations and 'high temperature' oscillations (HTO) of magnetoresistance of semimetallic BiSb alloys are investigated at Sb concentrations C up to 2.6 at.%. The results obtained are compared with those for Bi. It is found that HTO periods can, through the similarity transformation, be expressed in terms of cyclotron masses at extreme crosses of the Fermi surface. In the range of $0 \leq C \leq 2.6$ at.% the relative change in the periods of the HTO and Shubnikov-de Haas oscillations connected with holes appears to be similar. The HTO amplitude is described within generalized $\ln\tilde{\rho}(T)$ coordinates: at $T \gtrsim 10$K the functions $\ln\tilde{\rho}(T)$ plotted for samples of different compositions form a family of parallel straight lines. The shape of the dependence of HTO amplitude on the value of magnetic field is found. The possibility of HTO application to the investigation of the energy spectrum in a wide temperature range is discussed. (26 refs.)

108453 Magnetic conductivity of thin layers of semimetals in ultraquantum magnetic fields. A.V.Butenko, V.V.Andrievskii.
Fiz. Nizk. Temp. (USSR), vol.9, no.8, p.880-3 (Aug. 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The conductivity of bismuth films is studied in the ultraquantum region of longitudinal or transverse magnetic fields. The results obtained are in agreement with Abrikosov's theory of semimetal conductivity within the quantum limit. The relation between impurity concentration and film thickness is found. (4 refs.)

108454 Self-consistent treatment of dynamical diffusion coefficient of two dimensional random electron system under strong magnetic fields. II. Y.Ono (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2492-8 (July 1983).
On the assumption that the Landau subband splitting is much larger than the subband width, the dynamic diffusion coefficient $D(\omega,E)$ of a two dimensional electron system scattered by randomly distributed short-ranged impurities under strong magnetic fields is determined through diagramatic self-consistent treatment. The case where the Fermi energy E lies within the N-th Landau subband with $N \neq 0$ is considered. Essential features of $D(\omega, E)$ are the same as in the case with $N=0$. The quantity $D(0,E)$ is finite only when the Fermi energy E is equal to E_N (the 'subband center') at which the real part of the Green function for the N-th subband becomes zero, i.e. all the states are localized except for those at the subband center. The N-dependence of $D(0,E_N)$ and the N- and E-dependences of the localization length for $E \neq E_N$ are discussed.

108455 Anomaly in the magnetoresistance in graphite under pulsed high magnetic fields. K.Nakamura, T.Osada, G.Kido, N.Miura, S.Tanuma (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2875-81 (Aug. 1983).
The anomaly of the magnetoresistance in graphite at low temperatures and high magnetic fields has been extensively investigated by d.c. and a.c. measurements using pulsed high magnetic fields up to 45 T. Several new aspects of the anomaly were observed. Especially it was found that the anomaly was suppressed strongly in a.c. measurements. The observed aspects of the anomaly suggest that the anomaly should originate from some many body effect such as a transition into a CDW state. (10 refs.)

108456 Magneto-resistance of a semiconductor with the dislocation wall in the quantum limit. K.O.Kechechyan, A.A.Kirakosyan (Erevan State Univ., Erevan, USSR).
Phys. Status Solidi b (Germany), vol.118, no.2, p.521-4 (1 Aug. 1983).
By the use of the 'energy loss' method the longitudinal and the transverse magneto-resistances of a semiconductor at magnetic field orientations, normal to and along the wall of edge dislocations are calculated. The dependences of the magneto-resistance on temperature, the charge carrier concentration, the magnetic field, and the interdislocation distance in the wall are obtained. In particular it is shown that there is a maximum in magneto-resistance versus interdislocation distance dependence, the location of which depends on the values of the rest of parameters. (11 refs.)

108457 Electrical studies on (Mo/W)Se_2 single crystals. II. Temperature dependence of Hall effect. M.K.Agarwal, P.D.Patel, O.Vijayan (Dept. of Phys., Sardar Patel Univ., Vallabh Vidyanagar, India).
Phys. Status Solidi a (Germany), vol.78, no.2, p.469-73 (16 Aug. 1983).
For pt.I see ibid., vol.78, p.133 (1983). The temperature dependence of the Hall parameter in single crystals of the series $Mo_xW_{1-x}Se$ ($0 \leq x \leq 1$) is studied in the temperature range from 300 to about 550K and compared with previously reported data. The results in general indicate that the crystals are in intrinsic conduction in the temperature range of investigation. The results suggest that the band structures of these crystals are identical. (21 refs.)

108458 Investigation of formation conditions of thermal donors-I and -II in oxygen-containing n-type silicon within the temperature range 400 to 800°C. P.I.Baranskii, V.M.Babich, N.P.Baran, Yu.P.Dotsenko, V.B.Kovalchuk, V.A.Shershel (Inst. of Semiconductors, Acad. of Sci., Kiev, Ukrainian SSR).
Phys. Status Solidi a (Germany), vol.78, no.2, p.733-9 (16 Aug. 1983).
Thermally induced donors in Czochralski-grown dislocation-free phosphorus-doped n-Si crystals of different oxygen and carbon contents are investigated by different techniques. Hall effect within the temperature range 20 to 450K, dependences of piezoresistance and Hall coefficient on uniaxial elastic deformation within the mechanical stress range 0 to 15000 kp/cm^2 and electron paramagnetic resonance are used. The dependence of the donor behaviour on both the heat treatment and the starting materials is studied. It is established that thermally induced donors at 450°C differ from donors, which are induced at 650°C, if not in their chemical composition then, at any rate, in their structure and, possibly, in their surrounding. (23 refs.)

108459 Electron transport in highly compensated, undeformed *n*-type InSb in the temperature range 4.3-300K. H.Kishan, S.K.Agarwal, K.D.Chaudhuri (Dept. of Phys. & Astrophys., Univ. of Delhi, Delhi, India).
Phys. Rev. B (USA), vol.28, no.4, p.2078-90 (15 Aug. 1983).
Measurements of Hall coefficient, DC conductivity, and magnetoresistances have been made on highly compensated, undeformed *n*-type InSb samples from liquid helium to room temperature. The measurements show that the extent of the impurity-band conduction depends considerably on the compensation ratio and the effective concentration of the carriers. Two activation energies have been identified in the impurity-conduction region. The magnetoresistance at 4.2K is due to impurity-band conduction and is found to be positive. It shows approximately a square-law dependence on a magnetic field. The observed behavior of magnetoresistance at 300 and 77.4K is consistent with the behavior expected for free electrons. The variation of $\Delta\rho/\rho$ with temperature in the range 4.2-300K at 0.3 kG is essentialy governed by the variation of μ_H in the same temperature range. (32 refs.)

108460 Stability of the thermoelectric properties of p-type solid solutions based on Bi_2Te_3. N.K.Stark, S.N.Chizhevskaya, T.E.Svechnikova (A.A. Baikov Inst. of Metall., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.11, p.1566-9 (Nov. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.11, p.1824-6 (Nov. 1982).
The stability of the thermoelectric properties of the alloys $Bi_2Te_{3-x}Se_x$ ($x=0.12$ to 0.6) doped with SbI_3 and Hg_2Cl_2 has been investigated at room temperature and upon heating up to 300°C for 500 to 600 h. The properties of all the alloys are stable when they are kept at room temperature for up to 5 to 6 years. The properties of alloys containing a small amount of selenium, which have no tendency to undergo ordering, remain invariant upon heating. Alloys of the composition $Bi_2Te_{2.4}Se_{0.6}$ doped with Hg_2Cl_2 change their properties when heated above 200°C. The change in the properties is attributed to the transfer of chlorine atoms from Se positions to Te^I positions. When this occurs, the coefficient of thermoelectric efficiency remains constant. (9 refs.)

108461 Electrical conduction in nickel ferrite. P.Venugopal Reddy, R.Satyanarayana, T.Seshagiri Rao (Dept. of Phys., Osmania Univ., Hyderabad, India).
Phys. Status Solidi a (Germany), vol.78, no.2, p.K109-11 (16 Aug. 1983).
Polycrystalline nickel ferrite samples were prepared by the conventional double-sintering process. The samples were sintered at 1300°C in air for 4 h. The electrical conductivity for this material was determined over a temperature range 300 to 920K by the two-probe method. Thermoelectric power studies have also been carried out from room temperature to 430K by the hot-probe method. From the sign of the observed Seebeck coefficient the nickel ferrite sample is found to be an n-type semiconductor. (13 refs.)

108462 Thermoelectric power of $TiSe_{2-x}S_x$ mixed crystals at low temperatures. A.A.Lakhani, S.Jandl (Dept. de Phys., Faculte des Sci., Univ. de Sherbrooke, Sherbrooke, Quebec, Canada), C.Ayache, J.-P.Jay-Gerin.
Phys. Rev. B (USA), vol.28, no.4, p.1978-82 (15 Aug. 1983).
The authors present thermoelectric power (TEP) measurements, as a function of temperature in the range 7-450K, of $TiSe_{2-x}S_x$ mixed crystals for $x=0$, 0.5, 0.75, 1, and 1.25. A pronounced negative minimum is observed near 150K in the samples which exhibit the superlattice state. In contrast, in the nontransforming crystals, the TEP varies monotonically with temperature. They interpret the 150-K TEP dip in the transforming samples as due to a phonon-drag effect, in which the strong interaction between electrons and holes and the softening TA-phonon mode L_1^-—the mode actually defining the $2a_0 \times 2c_0$ superlattice condition—plays a primary role. 72.30 HIGH-FREQUENCY EFFECTS; PLASMA EFFECTS

108463 **Far-infrared magneto-plasma wave transmission and the dielectric constant in bismuth under high magnetic fields.** K.Hiruma, G.Kido, N.Miura (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2550-60 (July 1983).
Far-infrared magneto-plasma wave transmission in Bi was observed in pulsed high magnetic fields up to 40 T using an HCN laser(337 μm wavelength). The Fabry-Perot interferograms due to the propagation of the Alfven wave were observed as well as the cyclotron resonance, the combined resonance, and the Shubnikov-de Haas effect. The mass densities were obtained for the magnetic field parallel to the binary axis and electric field parallel to the bisectrix and trigonal axis. The lattice dielectric constant $\epsilon_{\parallel}$ was obtained as $\epsilon_{\parallel}=48$. As for $\epsilon_{\perp}$, however, an anomalously large increase of $\epsilon_{\perp}$ was observed as the magnetic field was increased above 14 T. The large field-dependence of $\epsilon_{\perp}$ was explained semi-quantitatively by the interband coupling between the lowest Landau levels of the conduction and valence bands for light electrons.

108464 **Far-infrared investigations of magnetoplasma effects in Bi in quantizing magnetic fields.** R.W.van der Heijden, P.Wyder (Res. Inst. for Materials, Univ. of Nijmegen, Nijmegen, Netherlands).
Physica B & C (Netherlands), vol.121B+C, no.3, p.299-342 (Aug. 1983).
A comprehensive experimental study is made of the magneto-optic absorption of Bi in the Voigt configuration in quantizing magnetic fields at frequencies covering the far-infrared range. At these frequencies, the typical magnetoplasma absorption features (cyclotron resonances, hybrid resonances and dielectric anomalies) gradually change character due to the strong quantization of the charge carrier system and because the experimental and cyclotron frequency become comparable to—and finally exceed—the plasma frequency. The fundamental quantum cyclotron resonance lineshape becomes strongly affected by transitions with $k_B \neq 0$ (k_B momentum along magnetic field), due to the nonparabolic band structure. Effects of carrier redistribution over different carrier pockets in the quantizing field region are strongly reflected in the hybrid resonance and dielectric anomaly lineshapes. In order to analyze the data, the absorption spectra are calculated in the limit of local electrodynamics, using either a conventional classical method or a more appropriate quantum-mechanical model. The latter model accounts qualitatively well for all major effects observed experimentally, taking into account the proper expression for the velocity matrix element for a nonparabolic band of the two-band model, over the entire frequency range. Nonlocal effects, clearly seen in the experimental data, are discussed qualitatively; these effects are illustrated by some additional experimental results obtained for Sb where nonlocal effects are very pronounced and strong. (80 refs.)

108465 **Nonlinear interaction of electromagnetic and plasma waves in periodic semiconductor structures.** A.A.Bulgakov (Inst. for Radiophys. & Electronics, Acad. of Sci., Kharkov, Ukrainian SSR).
Solid State Commun. (USA), vol.47, no.9, p.713-16 (Sept. 1983).
Interaction of waves in periodic laminar structures is considered. The matrix element for a classical superlattice consisting of alternating superconductor layers has been calculated. The periodicity of the medium is shown to entail new interactions nonexistent in uniform or semi-infinite geometries. Estimates predict a high efficiency of wave conversion in classical superlattices. (10 refs.)

Enhancement of Auger recombination in semiconductors by electron-hole plasma interactions ....See Entry 108449

72.40 PHOTOCONDUCTION AND PHOTOVOLTAIC EFFECTS; PHOTODIELECTRIC EFFECTS

108466 **Intracenter transitions in the dominant deep level (EL2) in GaAs.** M.Kaminska, M.Skowronski, J.Lagowski, J.M.Parsey, H.C.Gatos (MIT, Cambridge, MA, USA).
Appl. Phys. Lett. (USA), vol.43, no.3, p.302-4 (1 Aug. 1983).
Intracenter transitions in the major deep level EL2 in GaAs were identified for the first time by superimposing photocurrent measurements on those of optical absorption. These transitions were found to be responsible for the characteristic EL2 absorption band between 1.0 and 1.3 eV. At low temperatures (<60K) intracenter absorption exhibits a fine structure involving the zero phonon line and replicas at energies close to those of transverse acoustic phonons (TA). This coupling with TA phonons is a strong indication that EL2 is an extrinsic self-trapping center. (24 refs.)

108467 **Barrier-layer photo-EMF under conditions of heating of charge carriers by light.** Yu.G.Gurevich, V.B.Yurchenko (Lenin Kharkov Polytech. Inst., Kharkov, Ukrainian SSR).
Appl. Sol. Energy (USA), vol.18, no.5, p.5-10 (1982). Translation of: *Geliotekhnika (USSR)*, vol.18, no.5, p.6-10 (1982). [received: Aug. 1983]
The article is a theoretical study of the photovoltaic effect on a p-n junction under conditions of nonuniform electron heating with interband absorption of light. With the aim of enhancing the efficiency of photoelectric converters (PEC), the authors made a theoretical study of the photovoltaic effect on the p-n junction in a semiconductor with light electrons and heavy holes, under the condition that the electrons scattered energy quasi-elastically, and, in contrast to holes, they are heated with interband absorption of light. (7 refs.)

108468 **Photoelectric properties of nSiC-pSi heterojunctions.** V.M.Evdokimov, D.S.Strebkov, V.A.Tikhomirova, G.B.Fedosova (All Union Sci. Res. Inst of Current Sources, USSR).
Appl. Sol. Energy (USA), vol.18, no.5, p.11-16 (1982). Translation of: *Geliotekhnika (USSR)*, vol.18, no.5, p.10-15 (1982). [received: Aug. 1983]
The article describes studies of the photoelectric properties of heterojunction photoelements based on nSiC-pSi, manufactured by the method of fusing silicon onto monocrystalline silicon carbide. (8 refs.)

108469 **Investigation of lux-ampere characteristics of photoconducting layers of group $A^{II}B^{VI}$ semiconductors.** V.E.Bezvenyuk, V.B.Bogdanovich, A.N.Zyuganov.
Optoelektron. & Poluprovodn. Tekh. (USSR), no.1, p.81-7 (1982). In Russian.
An attempt is made to apply existing theory to an accurate quantitative description of the lux-ampere characteristics of the title semiconductors and to develop on its basis a method of studying their physical parameters, in the light of information published since 1963, on the assumption that the photoconductor is excited by a sufficiently wide radiation spectrum, including inherent and impurity photo-exciters. It is concluded that the method provides a means of replacing piecewise-exponential approximations by a simple analytical formula suitable for a wide range of illumination. (8 refs.) *N.F.S.*

108470 **Field-dependent photocarrier generation in crystalline polydiacetylenes.** U.Seiferheld, B.Ries, H.Bassler (Fachbereich Phys. Chem., Philipps-Univ., Marburg, Germany).
J. Phys. C (GB), vol.16, no.26, p.5189-201 (20 Sept. 1983).
The electric field dependence of the photocarrier generation rate has been measured for crystalline polydiacetylenes (PTS and DCH) in the range $10<E<10^5$ V cm^{-1}. For $E<10^4$ V cm^{-1} it follows the predictions of the one-dimensional Onsager theory, above 10^4 V cm^{-1} a superlinear increase with no indication of saturation is noted. The high-field behaviour is interpreted in terms of field-assisted ionisation of Frenkel excitation states that are degenerate with conduction band states. Applicability of the 1D Onsager theory to treat geminate pair dissociation is consistent with the recently developed concept of strong electron-phonon interaction leading to short carrier mean free paths. The microscopic anisotropy of the carrier mobility parallel and perpendicular to the polymer chain direction is found to be greater than 10^4, larger than inferred from macroscopic conduction experiments. (50 refs.)

108471 **Influence of Cr^{3+} doping on photoelectronic processes of $La_2Ti_2O_7$ pyrochlore and $La_{2/3}TiO_3$ perovskite anodes.** G.Campet, J.Claverie (Lab. de Chimie du Solide, CNRS, Talence, France), P.Salvador.
J. Phys. & Chem. Solids (GB), vol.44, no.9, p.925-9 (1983).
Photoelectrical properties of $La_2TiO_2O_7$ and $La_{2/3}TiO_3$ anodes undoped and Cr^{3+}-doped have been investigated. The onset of photocurrent for both the undoped and Cr^{3+} doped pyrochlore is at 400 nm while for undoped perovskite it is at 420 nm. A shift of the spectral photoresponse down to 550 nm is observed for the Cr-doped perovskite. The experimental data have been analyzed according to the Schottky barrier model of the semiconductor-electrolyte junction. This analysis has allowed the authors to propose a photoconduction mechanism. (18 refs.)

108472 **Electric-field-dependent charge-carrier trapping in a one-dimensional organic solid.** U.Seiferheld, H.Bassler (Fachbereich Phys. Chem., Philipps-Univ., Marburg, Germany), B.Movaghar.
Phys. Rev. Lett. (USA), vol.51, no.9, p.813-16 (29 Aug. 1983).
The relaxation of photoconduction in a polydiacetylene crystal containing a high density of defects is shown to follow the predictions of the theory for field-dependent diffusion in one dimension. At intermediate times and fields an $\exp[-3(t/\tau_1)^{1/3}]$ law is observed merging into an $\exp(-t/\tau_2)$ behavior as $t \rightarrow \infty$. The predicted functional change of $\tau_2(E)$ at a critical field is recovered. (17 refs.)

108473 **Transverse Dember effect in lead chalcogenides under linearly polarized light excitation.** D.Genzow (Sektion Phys., Humboldt-Univ. zu Berlin, Germany).
Phys. Status Solidi b (Germany), vol.118, no.2, p.K159-62 (1 Aug. 1983).
Deals with the transverse Dember effect in lead chalcogenides in the case that one valley is populated preferentially by linearly polarized optical excitation. The study of the transverse Dember effect leads to a direct comparison of the recombination time with the intervalley scattering time. If $\tau^* \ll \tau$, the effect vanishes because the transfer of excess carriers keeps the population of the valleys equalized. In pure PbSnTe samples at low temperature the intervalley scattering does not play an important role. (8 refs.)

108474 **Investigations of the effect of nonexponential distribution of gap states of photoconductivity.** E.Bhattacharya, K.L.Narasimhan (Tata Inst. of Fundamental Res., Bombay, India).
Phys. Rev. B (USA), vol.28, no.4, p.2287-8 (15 Aug. 1983).
The power-law dependence of photoconductivity on light intensity is generally taken as evidence for the density of states in the gap to be given by an exponential distribution. The authors have computed the photoconductivity for some nonexponential distributions of gap states. They show that neither the intensity dependence of photoconductivity nor the temperature dependence of the exponent can be used as evidence for an exponental gap-state distribution. An examination of the results of photoconductivity and space-charge-limited current on *a*-Si:H suggests that the distribution of gap states is not exponential as is commonly assumed. (11 refs.)

108475 **Detection of photoquenching in $CuGaTe_2$.** N.V.Joshi, R.Echeverria (Centro de Estudios Avanzados en Optica, Facultad de Ciencias, Univ. de Los Andes, Merida, Venezuela).
Solid State Commun. (USA), vol.47, no.4, p.251-3 (July 1983).
The photoconductivity spectrum of a single crystal of p type of $CuGaTe_2$, has been examined at 300K and 77K. Structural details, which appeared on the high energy side of the band gap transition, are attributed to the valence band structure. Pronounced photoquenching is also observed on the high energy side and it is due to the recombination of holes with the ejected electrons from the inner 3d level of copper atom. Such a photoquenching effect has not been reported so far. (8 refs.)

108476 **Energy distribution of photoelectrons from epitaxial $Ga_{0.82}In_{0.18}As$ layers.** M.L.Kapitsa, R.L.Nemchenok, Yu.A.Kudinov (M.I. Kalinin Polytech. Inst., Leningrad, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.261 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.415-16 (Feb. 1983). [received: Sept. 1983]
The authors study the energy distribution of photoelectrons from epitaxial $Ga_{0.82}In_{0.18}As$ (110) and GaAs (111) p-type layers doped to $\approx 5.10^{18}$ cm^{-3} and activated with cesium and oxygen in order to determine the maximum integrated sensitivity. Quantum yield curves were also recorded; the energy distribution curves were recorded in a spherical capacitor with a single grid by applying a retarding voltage and using passive differentiation. (2 refs.)

108477 **Dye sensitization effects on photovoltaic phenomena in MBBA liquid-crystal cells.** S.Sato, M.Kobayashi (Mining Coll., Akita Univ., Akita, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.J66C, no.6, p.484-5 (June 1983). In Japanese.
The dependence of short-circuit photocurrents on dye concentrations, temperature, and cell thickness is measured in nematic liquid-crystal cells containing methyl red. The photocurrents consist of three components: the first negative, the second positive, and the third negative peak. The second and the third components are controlled by diffusion processes. (5 refs.)

108478 **Interference oscillations of photocurrent in layered GeS crystals.** D.I.Bletskan, N.V.Polazhinets.
Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1233-5 (Aug. 1983). In Russian.
The results of studies in photoconductivity (PC) and transmission spectra anisotropy of thin ($d \approx 10.50$ μm) layered GeS crystals are presented. It is shown that due to the layered structure and good quality of the crystals under study the interference phenomenon appearing as oscillations in PC and transmission spectra is easily observed. (6 refs.)

72.50 ACOUSTOELECTRIC EFFECTS

108479 Acoustoelectric injection in piezoelectric CdS resonators. I.V.Ostrovskii, A.I.Polovina.
Ukr. Fiz. Zh. (USSR), vol.28, no.7, p.1109-10 (July 1983). In Russian.
The authors studied acoustoelectric injection in CdS piezoelectric plate-resonators. The electrons are injected into CdS from In contacts under the action of a piezoelectric ultrasonic field. They show that the ultrasonically injected charge influences the current-voltage characteristics, as well as being captured by traps giving the crystal a negative charge as a whole. (2 refs.)
V.G.P.

72.55 MAGNETOACOUSTIC EFFECTS

108480 Effects of the electron-hole interaction on the giant quantum attenuation and velocity change of sound waves in pyrolytic graphite. T.Inoue, T.Fukami, H.Kuriyaki (Dept. of Phys., Kyushu Univ., Fukuoka, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2862-9 (Aug. 1983).
The sound attenuation and velocity change in pyrolytic graphite have been simultaneously measured as a function of the temperature, frequency and magnetic field intensity. It has been found that both the attenuation coefficient and the velocity change are greatly enhanced when some electron and hole Landau levels cross simultaneously the Fermi level at a certain field. The interrelation between the enhancement rate in the attenuation coefficient and that in the velocity change is reasonably explained in terms of the electron-hole correlation interaction proposed by Kuramoto (1979). However, the experimental results of rather strong temperature dependence of both quantities and weak frequency dependence of the velocity change remain unexplained. (8 refs.)

72.60 MIXED CONDUCTIVITY AND CONDUCTIVITY TRANSITIONS

108481 An experimental determination of the critical exponents at the metal-insulator transition. A.N.Ionov, I.S.Shlimak, M.N.Matveev (A.F. Ioffe Phys. Tech. Inst., Acad. of Sci., Leningrad, USSR).
Solid State Commun. (USA), vol.47, no.10, p.763-6 (Sept. 1983).
This works deals with a determination of the magnitude of the critical exponents and their ratio from an analysis of the temperature dependence of the conductivity and magnetoresistivity of doped Ge⟨As⟩ with an impurity concentration making it an insulator near the metal-insulator transition. The values found are $\nu=0.60\pm0.04$, $\xi=1.38\pm0.07$, $\xi/\nu=2.3\pm0.2$; neither the critical exponents nor their ratio depend on compensation within $0<k<60\%$. (8 refs.)

108482 Electrical and structural properties of iron-doped β-alumina. J.H.Kennedy, S.M.Stuber, S.F.Parker (Dept. of Chem., Univ. of California, Santa Barbara, CA, USA), P.H.Barrett.
Solid State Ionics (Netherlands), vol.8, no.4, p.323-31 (July 1983).
β-alumina containing 50 w/o Fe exhibits high electronic conductivity when sintered in air but Mossbauer studies have shown the presence of Fe_3O_4. Single-phase β-alumina containing 50 w/o Fe could be prepared by sintering at 1400°C for 4-4.5 h followed by annealing at 1300°C for 96 h encapsulated with coarse β-alumina powder enriched with Na_2CO_3. Mossbauer spectroscopy indicated that all iron was present as Fe(III). Complex-plane impedance data showed a maximum bulk $\sigma_{25^\circ C}=5.56\times10^{-4}$ $(\Omega\ cm)^{-1}$ with little electronic conductivity. Reduction treatments on Fe-doped β-alumina utilizing H_2:N_2 gas were successful in producing a mixed conductor containing Fe(II) and Fe(III) but also produced a distorted β-alumina lattice. This material exhibited an electronic conductivity $\sigma_{e,25^\circ C}=2\times10^{-4}$ $(\Omega\ cm)^{-1}$ and a bulk ionic conductivity $\sigma_{b,25^\circ C}=1.35\times10^{-4}$ $(\Omega\ cm)^{-1}$. (12 refs.)

72.70 NOISE PROCESSES AND PHENOMENA

108483 A mechanism for 1/*f* noise in metals. F.N.H.Robinson (California Inst. of Technol., Pasadena, CA, USA).
Phys. Lett. A (Netherlands), vol.97A, no.4, p.162-3 (22 Aug. 1983).
The random motion of frozen-in lattice defects is shown to provide a possible origin for 1/*f* noise in metal films. (3 refs.)

108484 Theory of Josephson-type oscillations in a moving charge-density wave. S.E.Barnes (Dept. of Phys., Univ. of Miami, Coral Gables, FL, USA), A.Zawadowski.
Phys. Rev. Lett. (USA), vol.51, no.11, p.1003-6 (12 Sept. 1983).
A theory of Josephson-type phenomena is presented in which the two macroscopic quantum states are the two components of an incommensurate charge-density wave with opposite wave vectors. The Fermi levels of these two states are split for a moving charge-density wave and impurity scattering induces quantum oscillations. Such oscillations may be responsible for the observed narrow-band noise in materials such as $NbSe_3$ and TaS_3. (16 refs.)

108485 1/f noise in mobility fluctuations and the Boltzmann equation [nondegenerate semiconductors]. A.van der Ziel, C.M.van Vliet (Dept. of Electrical Engng., Univ. of Florida, Gainesville, FL, USA), R.J.J.Zijlstra, R.P.Jindal.
Physica B & C (Netherlands), vol.121B+C, no.3, p.420-22 (Aug. 1983).
The 1/*f* noise in mobility and diffusivity are discussed. The two noise densities are related due to an instantaneous Einstein relation, valid for times larger than the collision time. The Boltzmann equation treatment shows that Hooge's relation (1982) for the collective band mobility noise, $S_\mu(f)/(\bar{\mu})^2=\alpha/fN$, can be justified for a nondegenerate and spatially noncorrelated electron or ion gas. (14 refs.)

108486 Hall effect, anisotropy, and temperature-dependence measurements of 1/*f* noise in silicon on sapphire. R.D.Black (Dept. of Electrical Engng., Univ. of Illinois, Urbana, IL, USA), P.J.Restle, M.B.Weissmann.
Phys. Rev. B (USA), vol.28, no.4, p.1935-43 (15 Aug. 1983).
Measurements of several properties of 1/*f* noise in *n*-type silicon-on-sapphire wafers were made in the temperature range 100-330 K. The resistance fluctuations were nearly scalar, independent of temperature. The magnitude of the Hall-effect noise was larger than that predicted for simple carrier-number fluctuations at 100 and 140K, but less at 300K. The correlation between the Hall fluctuations and resistivity fluctuations had the same sign and slightly lower magnitude than would be expected for majority-carrier number fluctuations. Temperature-dependent features in the spectrum showed that the kinetics were thermally activated, while the weak temperature dependence of the magnitude of the features showed that the activated process could not be a simple electronic transition alone. A model involving slow processes at lattice defects modulating the depth of traps is suggested, and similarities and contrasts with other materials are discussed. (37 refs.)

108487 Charge-density-wave transport in orthorhombic TaS_3. III. Narrow-band 'noise'. A.Zettl, G.Gruner (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
Phys. Rev. B (USA), vol.28, no.4, p.2091-103 (15 Aug. 1983).
For pt.II see ibid., vol.26, p.5773 (1982). Narrow-band noise measurements are reported for the linear chain Peierls semiconductor, orthorhombic TaS_3. In the nonlinear conductivity region, sharp narrow-band noise peaks are observed with several harmonics. The amplitudes of the peaks are temperature dependent, starting from zero just below the charge-density-wave (CDW) transition at $T_p\sim215K$, and remaining approximately constant below $T=170K$. Between T_p and approximately 100K, where both the field- and the frequency-dependent conductivities suggest highly coherent response of the CDW condensate, the noise spectrum is simple (fundamental and harmonics). At low temperatures the noise spectrum becomes quite complicated, with many fundamental and harmonic peaks present, due to a loss of the transverse coherence in the material and indicative of a disordered CDW state. At intermediate temperatures a linear relationship is found between the excess CDW current and the fundamental noise frequency. Analysis in terms of coherent motion of the CDW indicates that the characteristic distance associated with the narrow-band noise is approximately equal to one CDW wavelength λ and that pinning is dominated by impurities rather than by commensurability. A comparison of the data is made with the predictions of the classical model of CDW transport and with Bardeen's theory (1982) of coherent current oscillations. The noise observations are compared to and contrasted with related measurements performed on the similar CDW material $NbSe_3$. (38 refs.)

73.00 ELECTRONIC STRUCTURE AND ELECTRICAL PROPERTIES OF SURFACES, INTERFACES, AND THIN FILMS

73.20 ELECTRONIC SURFACE STATES

(for emission and impact phenomena, see 79.)

108488 Calculation of the ionization energy of a donor atom near a semiconductor surface. Liu Zhenpeng (Dept. of Phys., Liaoning Univ., China). *Chin. J. Semicond. (China)*, vol.4, no.4, p.313-20 (July 1983). In Chinese.
The method of one-dimensional Euler's equation is used to calculate the ioization energy of a donor atom near a semiconductor surface. The results show

that, when the nucleus is located at the surface, the one-dimensional equation has an analytical solution matching with Levine's exact solution and is in agreement with Hellmann-Feynman theorem quantitatively, when the nucleus is far from the surface, the asymptotic solution of the equation coincides with that of the free donor atom. (11 refs.)

108489 The problem of the electron energy bands interconnection in abrupt semiconductor heterojunctions. M.Garcia (Dept. de Fisica, Univ. Nacional de Colombia, Bogota, Colombia).
Rev. Colomb. Fis. (Colombia), vol.15, no.1, p.115-35 (1981). In Spanish. [received: Aug. 1983]
A review is made of the different theoretical methods for determination of the electron energy bands discontinuities in abrupt semiconductor heterojunctions. There are two different points of view. One of these, with a 'first principles' treatment, makes some predictions about the energetic differences assuming only bulk properties of the semiconductors involved. The other analyzes different physical situations making all the emphasis in the junction interface. From the experimental point of view, it is difficult to make accurate measurements in the electronic levels in the junction. However, at least two successful methods have been developed and, for the sake of consistency, both are described. (24 refs.)

108490 Static response to a charge impurity near a metal surface. Finite-barrier treatment. G.Eano (Istituto di Fisica, Ferrara, Italy), A.Magnaterra.
Nuovo Cimento D (Italy), vol.2D, ser.1, no.4, p.1187-202 (July-Aug. 1983).
The static response to a charge impurity near a metal surface is computed in the RPA approximation for the case of a finite barrier. Particular attention is given to the problem of the correct infinite-volume limit and to the contribution of the one-particle states with energy higher than the potential barrier, which has been found to be not negligible. An integral equation for the self-consistent potential is derived and solved numerically. Results for Na and Zn are exhibited, showing remarkable difference with respect to the infinite-barrier case. (16 refs.)

108491 Electronic structure of metal-semiconductor interfaces. I.P.Batra (IBM Res. Lab., San Jose, CA, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.558-63 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
In a recent paper, the author investigated the electronic properties of a set of Ge-Al lattice-matched interfaces. These interfaces were constructed by placing an ideal (001)Ge substrate next to a 45° rotated (001)Al film. In all cases the Ge-Al interatomic distance was kept fixed at some ad hoc value. Using a self-consistent pseudopotential approach, the author now extends these calculations to consider the case where the interlayer distance is fixed for the on top and interstitial model but the Ge-Al interatomic distance is allowed to vary. One striking result of the calculation is that the differences among diverse interface geometries lead only to small differences in electronic properties if the interlayer distance is kept fixed. Single atomic metal overlayer calculations by Chelikowsky (1977), and Zhang and Schluter (1978) in different configurations show more pronounced differences. The results indicate that inclusion of more than one metal layer tends to smear out these differences. The author also calculates an optimal geometrical arrangement by minimizing the total energy of the system. The author critically discusses the weakly interacting cluster model and the chemisorption model of metal-semiconductor interfaces and places the work in context. The author also presents a semiclassical calculation which relates the interface density of occupied states to surface quantized level spacing. It suggests a possible surface absorption experiment for determining this state density. Future ramifications of the idealized model and the role it can play in simulating interfacial chemical reactions are briefly stated. (45 refs.)

108492 Interface formation at PbTe(100) surfaces: Ge, Al, and In overlayers. F.Cerrina (Synchrotron Radiation Center, Univ. of Wisconsin, Stoughton, WI, USA), R.R.Daniels, Te-Xiu Zhao, V.Fano.
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.570-3 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Adsorption processes were investigated for the first time on a IV-VI substrate, PbTe, by photoemission spectroscopy with synchrotron radiation. Ge, Al, and In overlayers on cleaved PbTe(100) all create an inversion layer at the PbTe side of the interface. Substantial Pb and Te outdiffusion is observed even at room temperature, resulting in nonabrupt interfaces. The band discontinuities of the PbTe-Ge interface are much different from those theoretically predicted by the electron affinity rule. (11 refs.)

108493 The effect of surface oxygen on the intermixing and Schottky barrier at GaAs(110)-Au interfaces. Z.M.Lu, W.G.Petro, P.H.Mahowald, M.Oshima, I.Lindau, W.E.Spicer (Stanford Electronics Labs., Stanford, CA, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.598-601 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
The effect of placing controlled amounts of oxygen on the clean, cleaved (110) surface of GaAs before exposure to Au has been investigated with ultraviolet photoemission spectroscopy (UPS) and X-ray photoemission spectroscopy (XPS). The authors studied: (a) the shape of the Ga-3d level and changes of Ga (or As) intensity with oxygen and subsequent Au deposition; (b) the position of the Ga-3d core level, with special regard to the surface or interface Fermi level (E_{fs}), as a function of oxygen and Au coverages; and (c) the valence band structure (where both oxygen and Au provide strong characteristic structure). For chemisorbed oxygen coverages of a small fraction up to 1 monolayer (ML) or above the Au:GaAs intermixing and E_f shifts are significantly reduced. For the *p*-type sample, after much less than 1 ML of oxygen, the maximum rise of E_{fs} is suppressed as Au is added; after 10^7L exposure E_{fs} remains stationary until approximately 1 ML of Au is deposited; for high oxygen coverage ($\geq 10^8$L), the oxygen appears to effectively retard the Au-GaAs interaction up to 10 ML of Au coverage. The width of the Ga-3d core level increases monotonically with increased oxygen exposure. With 10^{10}L exposure of oxygen, the Au coverage necessary to drop the Ga intensity to $1/e$ of its value on the oxidized surface is decreased to 4 ML, instead of 6 ML for the unoxidized surface. Supporting evidence from XPS spectra further demonstrates the intermixing is reduced between Au and GaAs by oxygen. The valence band structure shows the Au is dispersed on the oxidized surface. The results show that, for GaAs surfaces with a few tenths to above 1 ML of oxygen (before Au is deposited and with no annealing), the oxygen-GaAs interaction inhibits Au intermixing with GaAs. It causes a more abrupt interface than the case without oxygen. (12 refs.)

108494 The effect of doping on Fermi level position at a semiconductor-metal interface. A.Zur, T.C.McGill, D.L.Smith (Thomas J. Watson, Sr., Lab. of Appl. Phys., California Inst. of Technol., Pasadena, CA, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.608-9 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Summary form only given. The authors have investigated the phenomenon of Fermi level pinning by charged interface states at the semiconductor-metal interface. Two limiting cases were investigated. In the first case, they modeled an interface with an infinitely thick metal. In the second case, they modeled a submonolayer coverage by using a free semiconductor surface containing defects. In both cases, it was assumed that most of the defect induced interface states are localized a few angstroms inside the semiconductor. Under these conditions the authors have estimated the difference in Fermi level position between *n*- and *p*-type semiconductors to be less than 0.05 eV in the case of a thick metallic coverage, which agrees with the theoretical results of Draw and Smith (1980). This difference was shown to be the maximum one, and it occurs only when there is no pinning by the defects. When there is pinning, this difference is even smaller. No such upper bound on the difference in Fermi level position exists in the case of submonolayer coverage. The authors have also found that the number of interface states required to pin the Fermi level is $\approx 10^{14}$ cm^{-2} in the case of coverage by a thick metal, but only $\approx 10^{12}$ cm^{-2} in the case of a submonolayer coverage. (7 refs.)

108495 Schottky barrier formation and the initial metal-atom bonding state: InP(110)-Al vs GaAs(110)-Al. Te-Xiu Zhao, R.R.Daniels, A.D.Katnani, G.Margaritondo (Dept. of Phys., Univ. of Wisconsin, Madison, WI, USA), A.Zunger.
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.610-12 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
The authors have investigated the adatom states for different Al coverages of InP(110) by synchrotron-radiation photoemission, including ultralow coverages below 0.2 monolayer. The adatom states below 0.1 monolayer and above ~3 monolayer appear similar to the corresponding Al-adatom states on GaAs(110). In particular, the results for both systems appear consistent with the formation of Al clusters at 0.1-2 monolayer coverage, and the Fermi-level pinning occurs when the cluster formation starts. However, the similarity between the two systems is limited at intermediate (0.1-2 monolayer) coverages. At those coverages the authors observe a new bonded state for Al on InP, which is not observed on GaAs. The results emphasize, in general, the need to extend the experiments to ultralow coverages when studying the Schottky barrier formation process. (14 refs.)

108496 Electronic properties of the reconstructed Si(111)-7×7 surface. Yia-Chung Chang (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.709-13 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Electronic properties of the Si(111)-7×7 surface have been examined in several structure models, including the Lander's (1962-3) vacancy, Cardillo's (1981) triangular trough, and McRae's (1982) island models. The surface-atom resolved local density of states for these models are calculated in a realistic tight-binding scheme by the Green's function method. For McRae's model, the effect due to the dimerization of the second-layer edge atoms surrounding the island is also included. The comparison of the author's theoretical results with the experimental measurements for the electron density of states indicates that McRae's island model is a better candidate for the Si(111)-7×7 surface than the other models under examination. (31 refs.)

108497 Si(111)2×1 surface reconstructions calculated by the density-functional method. O.H.Nielsen, R.M.Martin, D.J.Chadi, K.Kunc (Xerox Palo Alto Res. Center, Palo Alto, CA, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.714-17 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
The π-bonded chain and molecular models for the reconstruction of the Si(111)2×1 surface are compared with each other and with angle-resolved photoemission data. The calculations are based on the local-density-functional approach, using ab initio pseudopotentials for calculating total energy and forces. The chain model is found to have lower energy than the molecular model. The experimental dispersion also favors the chain model, but the molecular model cannot be ruled out from the present data. (13 refs.)

108498 A first principles LCAO study of ideal and reconstructed diamond (111) 1×1 and 2×1 surfaces. D.Vanderbilt, S.G.Louie (Dept. of Phys., Univ. of California, Berkeley, CA, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.723-5 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
A first principles self-consistent LCAO approach is applied to the study of the C (111) ideal 1×1 and reconstructed 2×1 surfaces. The surface states are calculated for a variety of buckled, π-bonded chain, dimerized π-bonded chain, and π-bonded molecule reconstructions. None of the models studied to date are found to be in good agreement with photoemission experiments; the theoretical occupied dangling bond surface bands are either too deep in the gap, too dispersive, or both. The dimerized π-bonded chain model is in closest qualitative agreement with experiment. (23 refs.)

108499 Effects of an order-disorder transition on surface deep levels in metastable $(GaAs)_{1-x}Ge_{2x}$. M.A.Bowen, A.C.Redfield, D.V.Froelich, K.E.Newman, R.E.Allen, J.D.Dow (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.747-50 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
The major chemical trends in the energy levels of deep point defects at the (100) surfaces of $(GaAs)_{1-x}Ge_{2x}$ alloys are elucidated. These levels are predicted to exhibit bifurcation as functions of alloy composition x (at $x_c \simeq 0.3$) because of an order-disorder phase transition from a zincblende phase for $x < x_c$ to a diamond phase for $x > x_c$. Levels associated with distinct anion and cation sites of the zincblende structure coalesce into a single level of the diamond structure. (25 refs.)

108500 Interface states at Ni/c-Si(111) and Ni silicide/c-Si(111). M.Attard, P.Muret, A.Deneuville (Groupe des Transitions de Phases, CNRS, Grenoble, France).
Phys. Scr. (Sweden), vol.T4, p.173-5 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).
Ideality factor *n*, potential barriers ϕ_B and interface states (A and B) are determined for Ni, Ni_2Si, NiSi and $NiSi_2$/*c*-nSi and pSi diodes. ϕ_B increases (0.58 to 0.67 eV) with the relative Si content in the metallic compound, while B state is nearly constant and A state presents a minimum for Ni_2Si. (17 refs.)

108501 Surface electromagnetic fields in the semi-classical infinite barrier model: collective and single-particle response. R.R.Gehardts (Inst. fur Theoretische Phys., Freie Univ., Berlin, Berlin, Germany).
Phys. Scr. (Sweden), vol.28, no.2, p.235-45 (Aug. 1983).
The electromagnetic field near a metal surface is calculated within the 'SCIB' model, which replaces the surface by a specular reflection condition on a homogeneous system and assumes the conduction electrons to respond according to Lindhard's dielectric function The longitudinal fields included in the model are separated into contributions from a collective plasmon mode and from noncollective particle-hole excitations producing Friedel-type oscillations. The analytical properties of Lindhard's function in the complex k-plane are exploited to prove that these contributions sum in such a manner that, in contrast to previous erroneous statements, the normal component of the total electric field is continuous and no singular surface charges occur. Numerical results are presented which show that in a large frequency regime most of the electronic response is carried out by the plasmon mode. These results, which refute earlier speculations about the physical implications of the SCIB model, are compared with other model calculations of surface fields. (20 refs.)

108502 Correlation effects in doped organic semiconductors. N.A.Cade (Dept. of Phys., Queen Mary Coll., London, England).
Physica B & C (Netherlands), vol.121B+C, no.1-2, p.55-61 (1983).
The interaction between an isolated acceptor impurity and a conjugated, linearly extended, semiconducting polymer is modelled with an Anderson-like Hamiltonian. This system serves to illustrate the important correlation effects which ensure that only one electron can be transferrerd to the acceptor. A variational method is used which improves on the Hartree-Fock result and does not produce a magnetic ground state. The method is illustrated by a calculation for O_2 weakly adsorbed on a polydiacetylene chain. (13 refs.)

108503 Surface states in the presence of adsorbed atoms within the approximation of small radius potentials. L.Jurczyszyn (Inst. of Experimental Phys., Univ. of Wroclaw, Wroclaw, Poland), M.Steslicka.
Physica B & C (Netherlands), vol.122B+C, no.1, p.35-42 (Sept. 1983).
An approximation of the small radius potentials has been utilized to study the behaviour of the surface state energy in the presence of adsorbed atoms, forming a regular two-dimensional structure. The basic model assumption is that an electron in the vicinity of the crystal surface is moving only perpendicularly to the surface and is scattered by adsorbed atoms in all directions. The corresponding energy expression has been derived, solved numerically and discussed for different values of the most characteristic quantity for this approach, i.e. scattering length. The preliminary results indicate that for the coverage lower than the monolayer, the value of the surface state energy can be quite different at different points of the crystal surface. However, for the coverage corresponding to the monolayer, this change seems to be negligible. (7 refs.)

108504 Observation of a new surface state on Cu(001). S.D.Kevan (Bell Labs., Murray Hill, NJ, USA).
Phys. Rev. B (USA), vol.28, no.4, p.2268-70 (15 Aug. 1983).
High-resolution angle-resolved photoemission studies of the Cu(001) surface demonstrate the existence of a surface state which has not previously been reported. The state is located in a relative bulk band gap near the Fermi energy at the $\bar{X}$ point of the two-dimensional Brillouin zone. Its energy position and dispersion are in excellent agreement with recent calculations for this surface. Comparisons are made on this state's natural energy width and dispersion with similar states on other copper surfaces. (25 refs.)

108505 Charge density and orientation dependence of the effective mass in electron inversion layers on the principal surfaces of Si. E.Batke, D.Heitmann (Inst. fur Angewandte Phys., Univ. Hamburg, Hamburg, Germany).
Solid State Commun. (USA), vol.47, no.10, p.819-23 (Sept. 1983).
The effective mass in two dimensional space charge layers has been determined from plasmon resonance experiments on the three principal surfaces of Si for a wide range of charge densities $N_s=0.5\times10^{12}$ cm^{-2} to 1.2×10^{13} cm^{-2} and different directions of the plasmon wavevector in the surface. The authors report first plasmon experiments on Si(110) and verify an anisotropic plasmon mass. Special attention is paid to the low density regime, where electron-electron interaction and localization effects are expected. On all surfaces they find a mass enhancement with decreasing charge density. The onset of the mass enhancement occurs at different charge densities for the different surfaces and is correlated with the Fermi energy. (24 refs.)

108506 Electronic structure of a cobalt monolayer on Cu(100). R.Miranda (Inst. fur Phys. Chem., Univ. Munchen, Munchen, Germany), D.Chandesris, J.Lecante.
Surf. Sci. (Netherlands), vol.130, no.2, p.269-81 (Aug. 1983).
Angular resolved photoemission spectra using synchrotron radiation have been measured for different amounts of cobalt evaporated on Cu(100). At room temperature cobalt grows layer-by-layer forming well-ordered layers in registry with the substrate, as judged by AES, LEED and UPS measurements. The energy position and linewidth of the Cu peaks remain unchanged when cobalt is deposited onto the surface, suggesting a rather weak interaction between the d-bands of Co and Cu. The two-dimensional band structure of the monolayer of cobalt has been determined. The authors have obtained a value for the magnetic exchange splitting of $\Delta E_{exch}=0.80\pm0.15$ eV, which is nearly identical to the bulk value. A shift in the energy positions of the critical points for the monolayer versus bulk of cobalt is interpreted in terms of a narrower 2D density of states in the monolayer as compared to the bulk. A resonant valence-band two-electron satellite has been found. The correlation energy and screening effects of the two d-holes are very similar to the corresponding bulk values, while the decreased intensity of the satellite at resonance compared to the one for Co(0001) suggests that there are more d-states relative to s-states in the monolayer than in a bulk cobalt single crystal, in agreement with recent models of the valence band electronic structure at surfaces. 73.30 SURFACE DOUBLE LAYERS, SCHOTTKY BARRIERS, AND WORK FUNCTIONS

108507 Evaluation of the work function distribution of impregnated cathodes. J.C.Tonnerre, D.Brion, P.Palluel, A.M.Shroff (Thomson-CSF Electron Tube Div., Boulogne-Billancourt, France).
Appl. Surf. Sci. (Netherlands), vol.16, no.1-2, p.238-49 (May-June 1983). (3rd Tri-Service Cathode Workshop, Fort Monmouth, NJ, USA, 23-26 March 1982).
A mathematical treatment of the current-voltage characteristics of a close space planar diode has been used to evaluate work function distributions of cathode surfaces. Results obtained on various cathode types operated at different temperatures and time are presented. (9 refs.)

108508 DLTS determination of the Mo acceptor level in Mo-GaAs$_{0.6}$P$_{0.4}$ Schottky diodes. J.C.Lou, M.S.Lin, C.P.Wan (Dept. of Electrical Engng. Nat. Tsing Hua Univ., Hsinchu, Taiwan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.6, p.L336-7 (June 1983).
The results of deep level transient spectroscopy (DLTS) and Auger electron spectroscopy (AES) have shown the correlation between the trap levels, existing in the metal-semiconductor interface or in the bulk of these thermally degraded Mo-GaAs$_{0.6}$P$_{0.4}$ Schottky diodes, and the metal-semiconductor interdiffusion. These trap levels enhance the generation-recombination effect and degrade the diode performance. From the experimental results, it is revealed that the Mo-indiffusion induced hole trap $E_v+(0.83\pm0.01)$ eV plays a major role in Mo-GaAs$_{0.6}$P$_{0.4}$ Schottky diode degradation. (4 refs.)

108509 The Schottky barrier height of platinum nickel silicide. R.C.Ellwanger (Signetics Corp., Orem, UT, USA), A.E.Morgan, W.T.Stacy, Y.Tamminga.
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.533-9 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Films of $Pt_{0.4}Ni_{0.6}$ of different thicknesses were sputter deposited onto *n*-type (111)Si and annealed at various temperatures. The structure and composition of the ensuing $Pt_xNi_{1-x}Si$ films were determined using STEM/EDS, AES, RBS, and electron diffraction. The films were found to consist of several layers of distinct composition. The barrier height (ϕ_B) as determined from the diode forward *I-V* characteristics bore little relationship to the composition of the interfacial silicide layer. Furthermore, when successively thinning a film, ϕ_B decreased from 0.737 to 0.694 eV upon removal of the adjacent Pt-rich ($x=0.75$) layer thereby leaving only the Ni-rich ($x=0.1$) interfacial layer. These and other data are presented which indicate that the barrier height of platinum nickel silicide is not determined solely by interfacial properties. (12 refs.)

108510 Study of the GaAs-Au and Si-SiO$_2$ interface formation by the Kelvin method. L.Lassabatere, J.M.Palau, E.Vieujot-Testemale, A.Ismail, C.Raisin, J.Bonnet, L.Soonckindt (Lab. d'Etude des Surfaces, Interfaces et Composants, Univ. des Sci. et Techniques du Languedoc, Montpellier, France).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.540-5 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
In this paper the authors describe typical and simple results concerning the deposition of metal on GaAs surfaces and the first steps of Si oxidation. In the case of GaAs/metal, typical results illustrating the barrier formation, the electron affinity modification, the contribution of initial surface defects, and metal induced defects are presented and discussed, using the unified model of Spicer, Lindau et al. In the case of Si/SiO_2, the authors focus on illustrating the method of the growth of the oxide and the resulting work function modifications. (23 refs.)

108511 The dependence of Al Schottky barrier height on surface conditions of GaAs and AlAs grown by molecular beam epitaxy. W.I.Wang (Rockwell Internat., Microelectronics Res. & Dev. Center, Thousand Oaks, CA, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.574-80 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
A systematic study of the Al Schottky barrier height on clean GaAs (100) and AlAs (100) as a function of initial arsenic surface coverage has been performed. Two new surface phases on AlAs (100) have been observed. Al Schottky barrier height showed a steady decrease with increasing arsenic coverage on GaAs, and showed steady increase with increasing arsenic coverage on AlAs. The results are compared with current models of Schottky barrier formation. (21 refs.)

108512 Schottky barrier formation of Ag on GaAs(110). R.Ludeke (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), T.-C.Chiang, T.Miller.
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.581-7 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Photoemission studies of Ag deposits on cleaved *n*- and *p*-type GaAs for coverages from ~0.003 to 20 monolayers indicate clustered Ag growth and undetectable chemical interactions with the substrate. The position of the surface Fermi level changed throughout the deposit range. The data is inconsistent with most of the existing Schottky barrier models. The results are interpreted in terms of donor- and acceptor-like interface states which are characteristic of the clusters but modified by the screening at the interface. Values for the Schottky barrier of 0.89 eV on *n*-type and 0.35 eV on *p*-type material were obtained for the thickest coverage. (25 refs.)

108513 Schottky barrier formation and intermixing of noble metals on GaAs(110). S.H.Pan, D.Mo, W.G.Petro, I.Lindau, W.E.Spicer (Stanford Electronics Labs., Stanford Univ., Stanford, CA, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.593-7 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Photoemission measurements are used to study the Schottky barrier formation and the intermixing (with GaAs) of the three metals, Cu, Ag, and Au, deposited at room temperature on GaAs(110) cleaved surfaces. It is tentatively concluded that Fermi level pinning cannot be followed satisfactorily for metal coverages above a monolayer. The work of Palau (1982) on Schottky barrier height (*I-V* and *C-V*) for Au and Ag deposited on cleaved GaAs(110) in UHV indicate pinning positions surprisingly close to those found for other overlayers in the 'unified defect' model. It was found that 'intermixing' between noble metals and GaAs decreases in the order of Cu, Au, and Ag. Although island formation probably occurs, it is tentatively concluded that the principle reason for difficulty in using the photoemission measurements to determine E_{fs} for the noble metals is the inclusion of Ga (as well as As) in or on the noble metal overlayer. (12 refs.)

108514 Barrier height and leakage reduction in n-GaAs-platinum group metal Schottky barriers upon exposure to hydrogen. D.E.Aspnes, A.Heller (Bell Labs., Murray Hill, NJ, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.602-7 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Current-voltage (*I-V*), capacitance-voltage (*C-V*), and photovoltage (PV) data are obtained for Ru, Rh, Pd, Os, Ir, and Pt contacts deposited on chemically cleaned ⟨100⟩ *n*-GaAs wafers. By explicitly evaluating the relevant equations using realistic values of all parameters, the authors show that the currents obtained for small voltages are far too large to be explained by thermionic or recombination effects alone but are indicative of barrier height variations as proposed by Freeouf et al. (1982). The authors used the fact that the thermionic emission component is always present to reconcile the difference between apparent barrier heights determined by *I-V* and *C-V* measurements to obtain a consistent set of values for all materials. Upon exposure of the Ru and Ir contacts to atmospheric-pressure hydrogen, the barrier heights are reduced by 160 and 70 mV, respectively, and the ideality factors by 0.3 and 0.3, showing that hydrogen simultaneously lowers the barrier height and makes it more uniform over the contact for these junctions. The introduction of hydrogen into the bulk of these hydrogen-alloying metals has no effect on the transport properties of the Pt, Rh, and Pd junctions despite a reported work function change of nearly 1 eV for Pt, over 0.5 eV for Rh, and a phase change to a metallic hydride for Pd. The change in optical properties with ambient in the Drude region of Ru shows that the bulk Fermi level does not change by more than 40 meV upon hydrogenation, indicating that hydrogen is affecting primarily the interface dipole. (26 refs.)

108515 On the dependence of Schottky barrier height and interface states upon initial semiconductor surface parameters in GaAs {001}/Al junctions. C.Barret (Inst. d'Electronique Fondamentale, Univ. Paris-Sud, Orsay, France), J.Massies.
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.819-24 (July-Sept. 1983).
Single crystal Al growth was achieved in situ by molecular beam epitaxy (MBE) onto *n*-type GaAs {001} epitaxial layers with surfaces ranging from the $C(8\times2)$ Ga rich to the 1×1 As rich compositions. Two kinds of characterization have been undertaken on Schottky diodes defined by photolithography: classical barrier height measurements by the current-voltage method and interface states spectrum determination by Schottky capacitance spectroscopy. From these experiments two types of results have been obtained: (i) there is no significant influence of the initial semiconductor surface stoichiometry nor of the metal work function on the Schottky barrier height; (ii) three kinds of interface states appear in the upper half of the band gap. The dependence of these states to the initial semiconductor surface stoichiometry is only weak. These results are discussed in light of the existing models of metal semiconductor interfaces. (37 refs.)

108516 Evaluation of the effective work functions of a binary salt using thermochemical data on its two constituent elements. H.Kawano, T.Kenpo, H.Koga, Y.Hidaka (Dept. of Chem., Ehime Univ., Matsuyama, Japan).
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.2-3, p.241-6 (1 Sept. 1983).
The effective work functions (Φ^+ and Φ^-) for the emission of positive and negative ions (M^+ and X^-), respectively, from an inhomogeneous surface of a binary salt (MX) such as an alkali metal halide are investigated on the basis of experimental results achieved in the authors' previous work. Each of the work functions is generally expressed as a function of the thermochemical values of the constitutive elements: $\Phi^+=I+D+D^0-2D^+$ and $\Phi^-=A-D-D^0+2D^-$ where I is the first ionization energy of the electropositive atom M, A the electron affinity of the electronegative atom X, D the dissociation energy of the molecule MX, D^0 the desorption energy (or the heat of sublimation) of MX, and $D^\pm$ the desorption energy of M^+ or X^-. (16 refs.)

108517 Silicon-nickel silicide Schottky barriers formed by ion mixing. N.N.Gerasimenko, A.E.Gershinskii, A.Yu.Surtaev, S.A.Sokolov, E.I.Cherepov, B.I.Fomin, G.V.Timofeeva (Inst. of Semiconductor Phys., Acad. of Sci., Novosibirsk, USSR).
Phys. Status Solidi a (Germany), vol.78, no.2, p.K151-4 (16 Aug. 1983).
The formation and some electrical properties of silicon-Ni silicide Schottky barriers formed by ion implantation of Ar^+ ions are reported. The composition of the formed silicide layers was determined by transmission electron microscopy (TEM) and their thickness was measured by electrochemical anodic etching. (7 refs.)

108518 Schottky barriers on single-crystal indium telluride. S.Sen, D.N.Bose (Materials Sci. Centre, Indian Inst. of Technol., Kharagpur, India).
Solid-State Electron. (GB), vol.26, no.8, p.757-9 (Aug. 1983).
Schottky barriers on single-crystal *p*-In_2Te_3 were formed with evaporated films of materials Al, Ag and Cu with work-functions $\phi_M<(E_g+X_s)$ while Au, Ni and Pd films with larger ϕ_M produced ohmic contacts. The barrier heights were found to be 0.72, 0.67 and 0.69 eV respectively, while the ideality factors were 1.15, 3.48 and 6.54. The interface index s was 0.16 compared with the theoretical value of 0.146, its small magnitude indicating the covalent nature of the semiconductor. Barriers on *n*-In_2Te_3 showed $\phi_{bn}+\phi_{bp}=1.29$ eV compared with $E_g=1.12$ eV. A surface-state rather than a chemical bonding theory provided a satisfactory explanation of the results. (14 refs.)

108519 Variational calculation of the work function for small metal spheres. D.R.Snider, R.S.Sorbello (Dept. of Phys., Univ. of Wisconsin-Milwaukee, Milwaukee, WI, USA).
Solid State Commun. (USA), vol.47, no.10, p.845-9 (Sept. 1983).
A variational calculation based on the density functional formalism is performed for small metal spheres. The electron density is expressed in terms of two variational parameters chosen to minimize the energy. The authors find that the work function decreases as the size of the particle increases, approximately in agreement with the classical result for radii greater than a few angstroms. (17 refs.)

108520 Effects of the modification with temperature of the bulk properties on electron affinity and ionisation energy variations of some zinc-blende-type semiconductors. L.Soonckindt, J.Bonnet, P.Masri, L.Lassabatere (Lab. d'Etudes des Surfaces, Univ. des Sci. et des Tech. du Languedoc, Montpellier, France).
Surf. Sci. (Netherlands), vol.130, no.2, p.L337-43 (Aug. 1983).
Measurements of work function variation with temperature can be used, in principle, to determine the surface state position from space charge and surface barrier height modifications. In practice, interpretation of the results is complicated by possible charges concerning the barrier height, band gap energy, electron affinity, and ionisation energy. The variation with temperature of electron affinity and ionisation energy is discussed for some zincblende semiconductors. (10 refs.)

108521 Work function measurements and their relation to modern surface analysis techniques. G.A.Haas, R.E.Thomas, A.Shih, C.R.K.Marrian (Naval Res. Lab., Washington, DC, USA).
Ultramicroscopy (Netherlands), vol.11, no.2-3, p.199-206 (1983). (Surface Imaging and Analysis with High Spatial Resolution, Wickenburg Inn, AZ, USA, 12-15 Jan. 1983).
Since the work function of a solid is affected by the atoms in the outermost atomic layers of that solid, it provides a very sensitive measure of the nature of the surface. Traditional methods of measuring the work function generally involved heating the solid and analyzing the density of thermionic emitted electrons in order to obtain an average value of the work function. The use of low energy incident electrons, however, can also provide a determination of the work function and, furthermore, allows the surface to be investigated below thermionic temperatures. Also, by scanning the incident electron beam, the work function can be determined with comparatively high spatial resolution at any point on the surface. Such a scanning low energy electron probe (SLEEP) system has been used to obtain a topographic work function image of the surface as well as to provide a quantitative plot of the distribution in work function of the surface. Examples are given of how such work function results can be correlated with other surface analysis techniques. (8 refs.)

108522 Work function change of hydrogen chemisorbed Si (100) surface. Chen Binglai, Zhuang Chengqun, Wang Xun (Dept. of Phys., Fudan Univ., China).
Chin. J. Semicond. (China), vol.4, no.4, p.403-6 (July 1983). In Chinese.
The work function change of Si (100) surface after exposure to atomic hydrogen has been measured continuously as a function of hydrogen exposure time by electron beam retarding potential technique. A two step work function evolution curve has been found. The first step is supposed to be corresponding to the formation of a monohydride adsorbed phase which leads to a work function reduction of 0.19 eV with respect to the work function value of a clean surface. The second step gives a further reduction of work function by a value of 0.35 eV, which is supposed to be corresponding to the formation of the dihydride phase. These reductions of work function are explained as a result of the elimination of surface asymmetric dimer after the hydrogen adsorption. The work function of clean Si (100) surface varies slightly with the temperature, but its temperature coefficient increases significantly after forming the surface monohydride phase. (8 refs.)

108523 Numerical computation of charge accumulation on insulators repeatedly contacted by a metal sphere. J.Lowell (Joint Lab. of Phys., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England).
J. Electrostat. (Netherlands), vol.14, no.2, p.149-63 (Aug. 1983).
Repeated contacts of a metal object to the same spot on the surface of an insulator generally cause a continuous build-up of the contact charge on the insulator surface. A possible explanation for this is that the insulator is slightly conducting, so that the contact charge moves away from the contact region in the time that elapses between successive contacts. Experiments on 'insulators' with bulk conductivity have verified that this explanation does in fact hold in certain materials. In polymers, the characteristics of charge accumulation are markedly different, suggesting that charge accumulation in these materials is not due to bulk conduction. The authors discuss calculations of charge accumulation on insulators with surface conduction, carried out to determine whether surface conduction can account for charge accumulation on polymers. They investigate nonohmic as well as ohmic conduction. Backflow of charge is also studied and is shown to be strongly dependent on the geometry of the contact. It appears that charge accumulation in polymers is probably not a result of surface conduction. (10 refs.)

108524 Scanning tunneling microscopy of semiconductor surfaces. A.Baratoff, G.Binnig, H.Rohrer (IBM Zurich Res. Lab., Ruschlikon, Switzerland).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.703-4 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Summary form only given. Operations of the STM consists essentially in scanning a sharp metal tip over the surface to be investigated, close enough for a measurable tunnel current to be able to flow, i.e. at a distance of some 10 Å. The high spatial resolution of the STM, a few Å laterally and about 0.1 Å vertically, rests on the extreme sensitivity of the tunnel current J_T to the separation S of the electrodes. Together with local I-V characteristics (spectroscopy), scanning tunneling microscopy should ultimately provide a detailed mapping of wavefunctions just outside the sample surface with atomic resolution in space and in energy. A particularly appealing aspect is the conceptually simple experimental procedure: the wave-function overlap contours are selected spatially by adjusting the tunnel current, and energetically via the applied voltage. (7 refs.)

73.40J Metal-to-metal contacts

108525 Effect of lubricants on frictional polymerization of palladium electrical contacts. M.Antler (Bell Telephone Labs., Inc., Columbus, OH, USA).
ASLE Trans. (USA), vol.26, no.3, p.376-80 (July 1983).
The fretting of palladium contacts was studied at conditions similar to those which occur in separable electronic connectors. It was found that frictional polymers which form on their surfaces in ordinary room air can cause contact resistance to increase to unacceptable levels. The effect is dependent on wipe distance, becoming greater with increasing length, and is especially bad at the ends of the wear track. Contact resistance is less variable when fluid contact lubricants are used. Although the volume of polymer which forms increases when lubricant is present, the polymers are nonadherent and tend to be dispersed even when small amounts of fluid are used. A solid lubricant was found to be ineffective in stabilizing contact resistance. Fluid lubricant coatings, therefore, may provide some relief from the contact resistance problems of frictional polymerization when palladium and other catalytically active materials are used in sliding applications. 108526 Two-dimensional electron gas in a selectively doped $InP/In_{0.53}Ga_{0.47}As$ heterostructure grown by chloride transport vapor phase epitaxy. M.Takikawa, J.Komeno, M.Ozeki (Fujitsu Labs. Ltd., Atsugi, Japan).
Appl. Phys. Lett. (USA), vol.43, no.3, p.280-2 (1 Aug. 1983).
A selectively doped $InP/In_{0.53}Ga_{0.47}As$ heterostructure has been prepared by chloride transport vapor phase epitaxy. Hall and Subnikov-de Haas measurements revealed the existence of a high mobility, two-dimensional electron gas at the interface of this heterostructure. Enhanced electron mobilities were as high as 106000, 71200, and 9400 cm^2/Vs at 4.2, 77, and 300K, respectively. These indicate the excellent interface properties of the selectively doped $InP/In_{0.53}Ga_{0.47}As$ heterostructure grown by chloride transport vapor phase epitaxy. (6 refs.)

108527 High magnetic field studies of the two-dimensional electron gas in GaInAs-InP superlattices. J.C.Portal (INSA Lab. de Phys. des Solides, Toulouse, France), R.J.Nicholas, M.A.Brummell, M.Razeghi, M.A.Poisson.
Appl. Phys. Lett. (USA), vol.43, no.3, p.293-5 (1 Aug. 1983).
Reports the observation of Shubnikov-de Haas oscillations in superlattices of GaInAs and InP, showing evidence of two-dimensional behavior. The electron g factor is deduced from both the criteria for resolution of a spin splitting by comparison with the broadening parameter Γ, and from the tilted field method, and is shown to increase with increasing resolution of the Landau levels in a manner consistent with the theory of Ando and Uemura (1974). In the ultraquantum limit, structure at $\nu=1/2$ and $\nu=1/3$ is observed. (24 refs.)

108528 Internal photoemission from quantum well heterojunction superlattices by phononless free-carrier absorption. L.C.Chiu, J.S.Smith, S.Margalit, A.Yariv (California Inst. of Technol., Pasadena, CA, USA).
Appl. Phys. Lett. (USA), vol.43, no.4, p.331-2 (15 Aug. 1983).
The possibility of phononless free-carrier absorption in quantum well heterojunction superlattices was investigated. Order of magnitude calculation showed that the absorption coefficient was significantly enhanced over the phonon-assisted process. Important aspects of the enhyancement in the design of infrared photodetectors are discussed. (4 refs.)

108529 Transport characteristics of L-point and Γ-point electrons through GaAs-$Ga_{1-x}Al_xAs$-GaAs (111) double heterojunctions. C.Mailhiot, D.L.Smith, T.C.McGill (Thomas J. Watson, Sr., Lab. of Appl. Phys., California Inst. of Technol., Pasadena, CA, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.637-42 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Presents a study on the transport characteristics of L-point and Γ-point derived electrons through abrupt GaAs-$Ga_{1-x}Al_xAs$-GaAs(111) double heterojunctions. The use of complex-**k** band structures in the tight-binding approximation and transfer matrices provide a reasonably accurate description of the wave function at the GaAs-$Ga_{1-x}Al_xAs$ interface. A representation of the wave function in terms of bulk complex-**k** Bloch states is used in the GaAs regions where the potential is bulklike. A representation of the wave function in terms of planar orbitals is used in the central $Ga_{1-x}Al_xAs$ region where the potential deviates from its bulk value (i.e. interfacial region). Within this theoretical framework, realistic band structure effects are taken into account and no artificial rules regarding the connection of the wave function across the interface are introduced. The ten-band tight-binding model includes admixture in the total wave function of states derived from different extrema of the GaAs conduction band. States derived from the same extremum of the conduction band appear to couple strongly to each other, whereas states derived from different extrema are found to couple weakly. Transport characteristics of incoming L-point and Γ-point Bloch states are examined as a function of the energy of the incoming state, thickness of the $Ga_{1-x}Al_xAs$ barrier, and alloy composition x. Transmission through the $Ga_{1-x}Al_xAs$ barrier is either tunneling or propagating depending on the nature of the Bloch states available for strong coupling in the alloy. Since Bloch states derived from different extrema of the conduction band appear to couple weakly to each other, it seems possible to reflect the low velocity L-point component of the current while transmitting the high velocity Γ-point component. (19 refs.)

108530 Effects of compositional grading on GaAs-$Ga_{1-x}Al_xAs$ interface and quantum well electronic structure. J.N.Schulman (Dept. of Phys. & Astron., Univ. of Hawaii, Honolulu, HI, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.644-7 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
The electronic structure of the abrupt GaAs-$Ga_{1-x}Al_xAs$(001) heterojunction is compared with that of the heterojunction in which the transition from GaAs to GaAs-$Ga_{1-x}Al_xAs$ occurs over several atomic layers across the interface. The effects of varying the width of the compositionally graded region on interfacial boundary conditions and on quantum well energy levels are studied using the tight-binding method. The compositional grading is modeled in the virtual crystal approximation. Substantial shifts in quantum well energies are found. For example, the ground state energy for a quantum well with 15 central GaAs layers and bounded by AlAs increases by 30% for graded region widths of six alloy layers. The effects of grading on the electronic wave function at the interface are studied by expanding it in terms of bulk states with complex wave vector values. The relative contribution of the bulk states from the neighborhood of the Γ and X points to typical conduction band states are determined. It is found that grading the interface over a small number of layers (two or three) effectively eliminates the X-point state contribution. Thus, the effective mass approximation, which includes Γ-point related bulk states only, is shown to be better justified for slightly graded interfaces. (16 refs.)

108531 Characterization of GaAs:O-Ge and ZnSe:O-Ge heterointerfaces grown on oxygen-exposed GaAs and ZnSe substrates. F.C.Jain (Electrical Engng. & Computer Sci. Dept., Univ. of Connecticut, Storrs, CT, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.661-7 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
The electronic behavior of *p-n* and isotype heterojunctions is shown to be significantly different when a chemisorbed oxygen/oxide layer is present at the heterointerface. Specifically, the characteristics of *n*GaAs:O-*n*Ge and *n*ZnSe:O-*p*Ge devices are described. In *n*GaAs:O-*n*Ge devices, the author has observed under dark and illuminated conditions a polarity inversion in *V-I* characteristics not normally expected of conventional *n*GaAs-*n*Ge heterojunctions. The polarity inversion and other aspects of *V-I* and *C-V* characteristics of GaAs:O-Ge devices are consistently explained by a new band model involving the presence of localized inversion and/or accumulation layers at the heterointerface. The novel features in the *V-I* and *C-V* characteristics of *n*ZnSe-*p*Ge heterojunctions resulting from the presence of interfacial oxygen are also presented. (26 refs.)

108532 Electrical measurements of the conduction band discontinuity of the abrupt Ge-GaAs $\langle 100 \rangle$ heterojunction. J.M.Ballingall (McDonnell Douglas Res. Labs., St. Louis, MO, USA), C.E.C.Wood, L.F.Eastman.
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.675-81 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Current-voltage (*I-V*) measurements are used to measure the conduction band discontinuity of the *n-n*$\langle 100 \rangle$ Ge-GaAs heterojunction grown by molecular beam epitaxy. All of the heterojunctions were grown at 300°C to ensure abrupt interfaces. The free electron concentrations were varied on both sides of the heterojunctions by controlled doping of the Ge and GaAs epitaxial films. The current-voltage characteristics vary systematically with doping, temperature, and postgrowth heat treatments. The electrical barrier at the heterojunction is measured to be 80 ± 10 meV. This value is considerably smaller than values obtained with vapor-phase-grown $\langle 100 \rangle$ *n-n* heterojunctions. The 80 meV value is in excellent agreement with theoretical predictions for the conduction band discontinuity at the abrupt, unreconstructed $\langle 100 \rangle$ interface. Postgrowth heat treatments show a decrease in the electrical barrier which is consistent with an interdiffusion model for the atomic species at the interface and contrary to previous anomalous results. The differences between the electrical barriers obtained with molecular beam and vapor phase epitaxial heterojunctions are apparently due to differences in substrate preparation procedures and results as well as the inherent differences in the two growth processes. (36 refs.)

108533 Band discontinuities and interface Fermi-level positions in Ge-GaAs (110) heterojunctions. S.P.Kowalczyk, R.W.Grant, J.R.Waldrop, E.A.Kraut (Microelectronics Res. & Dev. Center, Rockwell Internat., Thousand Oaks, CA, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.684-6 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
X-ray photoelectron spectroscopy (XPS) measurements were performed on (*p*)Ge-(*p*)GaAs(110) and (*p*)Ge-(*n*)GaAs(110) heterojunctions to investigate the possible influence of interface defect levels on valence-band discontinuities ΔE_v. These XPS experiments indicate that ΔE_v is independent of GaAs dopant type. Comparison of the present results with results from previous work shows that ΔE_v is independent of the GaAs(110) surface preparation method (thermal, sputter and annealed, or cleavage) and Ge dopant type. No evidence is found for the presence of an intrinsic dipole layer associated with interface defect levels. (19 refs.)

108534 Optical investigation of MQW system InP-InGaAs-InP. K.Kodama, M.Ozeki, J.Komeno (Fujitsu Labs. Ltd., Atsugi, Japan).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.696-9 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
A new multiquantum well system, InP-InGaAs-InP, has been grown by the chloride transport vapor phase epitaxy. The Auger measurements show that a very sharp InGaAs-InP heterointerface (less than 30 Å) can be obtained by the present growth system. Optical absorption and photoluminescence measurements give the evidence for the formation of the quantum wells in InGaAs layers. Temperature dependence of photoluminescence indicates that the dominant emission at low temperatures is interpreted as the band-to-acceptor transition. It also shows that temperature dependence of the transition energy from hole subband to electron subband is apparently affected by the thickness of the quantum well. Two models are presented for this. One takes into account the localized phonons in the InGaAs-InP heterointerface region whose frequency is higher than that in the bulk samples. The other considers the difference in the thermal expansion coefficients of InGaAs and InP, which reduces a shift of the [000], conduction band minimum of the InGaAs quantum well layer toward higher energy with decreasing temperature. (18 refs.)

108535 Electron scattering processes at modulation-doped GaAs-(AlGa)As interfaces. H.L.Stormer (Bell Labs., Murray Hill, NJ, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.702 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Summary form only given. A review of transport in the high mobility two-dimensional electron gas at the interface of modulation-doped GaAs-(AlGa)As heterostructures is presented. Mobility enhancement results from a spatial separation of mobile carriers from their ionized parent impurities. This is achieved at a heterojunction interface where carriers from the wide gap material transfer across the interface populating the low lying conduction band states of the narrow gap material. Those carriers form a two-dimensional electron gas bound to the heterojunction via the Coulomb forces of their parent impurities across the interface but spatially separated from the strong part of the scattering potential of these ionized donors. (11 refs.)

108536 Optoelectronic instruments based on p-n Si carbide junctions obtained by various methods. A review. S.I.Vlaskina, K.D.Demakov, S.V.Svechnikov, O.T.Sergeev.
Optoelektron. & Poluprovodn. Tekh. (USSR), no.1, p.74-81 (1982). In Russian.
Information published since 1970 is discussed under the headings: diffusional p-n junctions; ionic implantation p-n junctions; basic character of p-n junctions obtained by diffusion and ion implantation of impurities; and optoelectronic instruments. It is concluded that the results of studying various methods of establishing p-n junctions, and contacts for Si carbide crystals of optoelectronic instruments for various purposes are in good agreement with the parameters of integrated circuits produced by batch production. (13 refs.) *N.F.S.*

108537 Electrical and photoelectrical properties of three-layer heterostructures *n*-$Al_{0.3}Ga_{0.7}As$-*p*-$Al_{0.1}Ga_{0.9}As$-*p*-GaAs and *p*-$Al_{0.65}Ga_{0.35}As$-*n*-GaAs-*n*-GaAs. D.D.Askerov, A.M.Agaev, T.D.Dzhafarov, I.E.Maronchuk.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.4, p.65-9 (1982). In Russian.
An investigation has been made of the electrical properties and spectral distribution of the photoconductivity of epitaxial *n*-$Al_{0.3}Ga_{0.7}As$-$Al_{0.1}Ga_{0.9}As$-*p*-GaAs and *p*-$Al_{0.65}Ga_{0.35}As$-*n*-GaAs-*n* GaAs heterostructures (*n-p* and *p-n*-heterostructures, respectively). *P-n* heterojunction is established to show a wider range of photoconductivity ($h\nu=1.35$-2.4 eV) compared to *n-p* heterojunctions ($h\nu=1.30$-1.75 eV). Short circuit photocurrent density (I_{sc}), open-circuit voltages (U_{oc}) and effectiveness (η) of the photoelements in question at illumination intensity 140 mW/cm^2 are shown to be as follows: $I_{sc}=3$ mA/cm^2, $U_{OC}=0.95$ V, $\eta=1.5\%$ (for *n-p* heterojunction) and $I_{sc}=7$ mA/cm^2, $U_{OC}=0.83$ V, $\eta=2.1\%$ (for *p-n* heterojunction). Energy band diagram of the heterojunctions adequately describing the experimental data has been constructed. (7 refs.)

108538 Electronic characteristics of Ge-GaAs interface having chemisorbed oxygen at the GaAs surface. F.C.Jain (Univ. of Connecticut, Storrs, CT, USA).
Phys. Scr. (Sweden), vol.T4, p.183-8 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).
The electronic behaviour of GaAs:O-Ge structures having chemisorbed oxygen at the interface is shown to be significantly different from that expected in a conventional GaAs-Ge heterointerface. The presence of oxygen at the interface has been detected by performing depth-compositional analysis using Auger Electron Spectroscopic technique in conjunction with the Ion Milling. In addition, in *n*GaAs:O-*p*Ge samples interfacial oxygen bonding to arsenic atoms was also confirmed by ESCA studies which reproducibly revealed a chemical shift of about 4.4 eV in the arsenic 3*d* peak. A novel features observed in the electronic transport characteristics of GaAs:O-Ge devices is the inversion of *V-I* and *C-V* characteristics. Theoretically, observed *V-I* and *C-V* characteristics are explained by a new model involving the presence of inversion and/or accumulation layers localized at the heterointerface. (21 refs.)

108539 Determination of the discrete 'surface' energy level in semi-infinite superlattice structures. V.Milanovic (Faculty of Electrical Engng., Univ. of Belgrade, Belgrade, Yugoslavia).
Physica B & C (Netherlands), vol.121B+C, no.1-2, p.181-6 (1983).
Taking into account that a one-dimensional structure is periodic only in one direction (being unperiodic in the opposite direction) and applying the corresponding boundary conditions, the relation is given wherefrom the energy of the discrete 'surface' levels is determined. Analyzing the expression for the wave function corresponding to the discrete levels, it was shown that the states are localized in the vicinity of the 'interface'. The wave functions extend deeper in the periodic part of the structure, if the energies are nearer to the top of the corresponding forbidden band. Numerical calculations are given for the structure (already experimentally realized) consisting of $Al_xGa_{1-x}As$-GaAs superlattice, of the GaAs layer of a finite thickness as well as of a semi-infinite layer of $Al_yGa_{1-y}As$ $(y>x)$. Varying the thickness of the GaAs layer, it was shown that with the increase of the thickness the number of discrete ('surface') states increases. For small values of thickness there is a region for which the discrete states in all forbidden bands disappear. (9 refs.)

108540 Self-consistent evaluation of nonuniform superlattice parameters by the harmonic method. V.Milanovic, D.Tjapkin (Faculty of Electrical Engng., Belgrade, Yugoslavia).
Physica B & C (Netherlands), vol.121B+C, no.1-2, p.187-92 (1983).
Starting from the fact that in superlattice structures the spatial dependence of effective mass is present, the self-consistent procedure based on the representation of all periodic quantities in the form of complex Fourier series is given. It was shown that the determination of the allowed energy values reduces to the determination of the eigenvalue of an infinite symmetric matrix. The analysis of off-diagonal elements of this matrix leads to the important conclusion that the energy spectrum has band structure, if either the potential energy or the effective mass is spatially dependent. The solution of the Poisson equation (more exactly the first Maxwell field equation) reduces to the solution of an infinite system of linear equations where the Fourier coefficients of potential energy appear as unknown. (no refs.)

108541 Microscopic study of semiconductor heterojunctions: photoemission measurement of the valence-band discontinuity and of the potential barriers. A.D.Katnani, G.Margaritondo (Dept. of Phys., Univ. of Wisconsin, Madison, WI, USA).
Phys. Rev. B (USA), vol.28, no.4, p.1944-56 (15 Aug. 1983).
The authors report on synchrotron-radiation photoemission measurements of the valence-band discontinuity and of the Fermi-level position for 25 different interfaces involving group IV, III-V, and II-VI semiconductor substrates and Ge or Si overlayers. A comparison is made between measured discontinuities and the predictions of current theoretical models. They find the best agreement with empirically corrected versions of the models of Harrison (1977) and of Frensley and Kroemer (1977). However, they present a new empirical rule based on present results and on those of other authors which yields even more accurate predictions of band discontinuities. The measured Fermi-level-pinning position of each substrate is the same for both Ge and Si overlayers. This result is discussed in terms of the 'defect model' of Fermi-level pinning, originally developed for Schottky barriers. (41 refs.)

108542 Observation of a fractional quantum number. D.C.Tsui (Dept. of Electrical Engng. & Computer Sci., Princeton Univ., Princeton, NJ, USA), H.L.Stormer, J.C.M.Hwang, J.S.Brooks, M.J.Naughton.
Phys. Rev. B (USA), vol.28, no.4, p.2274-5 (15 Aug. 1983).
New experiments on the two-dimensional electrons in GaAs-$Al_{0.3}Ga_{0.7}As$ heterostructures at $T\sim0.14$K and $b\leq190$ kG demonstrate that the quantum number of the quantized Hall resistance, close to $^1/_3$ filling of the last Landau level, is $^1/_3$ to better than 1 part in 10^4. (10 refs.)

108543 Logarithmic behavior in a new two-dimensional metal: HgTe-CdTe superlattice. N.P.Ong, G.Kote (Dept. of Phys., Univ. of Southern California, Los Angeles, CA, USA), J.T.Cheung.
Phys. Rev. B (USA), vol.28, no.4, p.2289-91 (15 Aug. 1983).
The resistance of a HgTe-CdTe superlattice of layer thickness 110 Å/220 Å shows logarithmic behavior with respect to temperature below 30K. The field-parallel and field-perpendicular magnetoresistance clearly distinguish between the orbital and spin-dependent scattering mechanisms, and confirm two-dimensional behavior. (19 refs.)

108544 Photovoltaic properties of sputtered *n*-CdO films on *p*-Cu_2O. L.Papadimitriou, N.A.Economou (Dept. of Phys., Univ. of Thessaloniki, Thessaloniki, Greece), D.Trivich.
Solid-State Electron. (GB), vol.26, no.8, p.767-9 (Aug. 1983).
The heterojunction CdO/Cu_2O was prepared by sputtering CdO films on Cu_2O at room temperature. The optical transmission of CdO films at a thickness of ~1000 Å was ~85%. The analysis of the I-V characteristics at

different temperatures gave information on the carrier transport mechanism at the junction. The forward and the reverse dark current is dominated by a tunneling process. Measurements of the open-circuit photovoltage resulted in a curve which indicates a sensitivity range from 2.25 to 2.48 eV, similar to that found in Cu_2O MIS solar cells. (8 refs.)

108545 Low field mobility of 2-d electron gas in modulation doped $Al_xGa_{1-x}As$/GaAs layers. K.Lee, M.S.Shur (Dept. of Electrical Engng., Univ. of Minnesota, Minneapolis, MN, USA), T.J.Drummond, H.Morkoc.
UGIM-83 Proceedings. 1983 University/Government/Industry Microelectronics Symposium, College Station, TX, USA, 25-27 May 1983 (New York, USA: IEEE 1983), p.173-7
Derives a simple analytical formula for the low field mobility which uses 2-d degenerate statistics for the 2-d electron gas. It also takes into account the finite width of the depletion layer in (Al,Ga)As (which affects primarily impurity scattering), scattering by the charged interface states and polar optical and acoustic phonon scattering. The maximum mobility for a given structure is determined by scattering by the interface charged states. The ultimate mobility which may be achieved is limited by acoustic phonon scattering at about 8×10^6 cm^2/Vs for a 2-d electron gas density of $n_{so}\simeq4\times10^{11}$ cm^{-1}. The results agree very well with experimental data. (18 refs.)

73.40M Semiconductor-electrolyte contacts

108546 Characterization of intrinsic amorphous hydrogenated silicon as a thin-film photocathode material. Efficient photoreduction processes in aqueous solution. D.J.Harrison, G.S.Calabrese, A.J.Ricco (Dept. of Chem., MIT, Cambridge, MA, USA), J.Dresner, M.S.Wrighton.
J. Am. Chem. Soc. (USA), vol.105, no.13, p.4212-19 (29 June 1983).
Intrinsic amorphous hydrogenated silicon, a-Si:H, has been characterized as a thin-film (8000 Å) a-Si:H material. The intrinsic a-Si:H is deposited onto a 200-Å thick, heavily B-doped, layer of a-Si:H on stainless steel. The 200-Å p^+-a-Si:H layer ensures a back contact to the valence band to give as large a field across the 8000-Å intrinsic layer as possible when the intrinsic layer is contacted on the other side by an electrolyte solution containing a redox couple. The a-Si:H photocathodes give good photovoltages in aqueous and nonaqueous media, up to 855 mV, depending on the $E_{1/2}$ of the redox couple in contact with the electrode. A plot of photovoltage vs. $E_{1/2}$ shows a slope of only 0.42. A zero photovoltage is extrapolated to obtain for $E_{1/2}$ no more negative than +0.9 V vs. SCE; the photovoltage is constant for $E_{1/2}$ more negative than ~−0.8 V vs. SCE. The slope of less than 1.0 suggests a deleterious role for states situated between the valence and conduction bands of a-Si:H. The surface of a-Si:H can be derivatized with an *N,N′*-dialkyl-4,4′-bipyridinium reagent followed by deposition of Pd or Pt to effect H_2 evolution at an electrode potential up to ~700 mV more positive than on a conventional electrode. (33 refs.)

108547 The semiconductor-electrolyte interface: optical transitions in CdMnTe alloys. P.Lemasson (Lab. d'Electrochimie Interfaciale, CNRS, Meudon, France), Bing-Liang Wu, R.Triboulet, J.Gautron.
Solid State Commun. (USA), vol.47, no.9, p.669-71 (Sept. 1983).
The junction p-$Cd_{1-x}Mn_xTe$-electrolyte is studied under monochromatic illumination for the alloy composition range $0\leq x\leq0.7$. Optical transitions in the semiconductor are evidenced by photocurrent measurements. In the composition range $0\leq x\leq0.45$, the nature of the fundamental transition appears to be the same as in CdTe (valence band $\Gamma_8\rightarrow$conduction band Γ_6). For $x>0.45$, the observed photocurrent peak, pinned at a constant energy value ca. 2.1 eV, may presumably be related to a transition $\Gamma_8\rightarrow d(Mn)$ level whereas the photocurrent edge associated to the former transition increases linearly with x. 73.40N Metal-nonmetal contacts

108548 On the mechanism of self-lubrication in metal-polymer electrical contacts. A.I.Sviridyonok, V.V.Meshkov (Inst. of Mech. of Metal-Polymer Systems, Acad. of Sci., Gomel, Byelorussian SSR).
ASLE Trans. (USA), vol.26, no.3, p.311-16 (July 1983).
It is shown that when metal-polymer materials are used as contacts, the contact behavior depends on the processes of generation and regeneration of transfer films. A new technique, designed and applied for the examination of surface layers of the materials, together with known procedures allowed a comparison of surface properties, such as electrophysical and topographic, of the metal-polymer friction transfer films with those formed by conventional compounds. The kinetics of the metal-polymer film formation owing to friction transfer is described and a self-lubrication mechanism is suggested for metal-polymer electrical contacts. (15 refs.)

108549 Contact resistance of Al/Si ohmic electrodes formed by rapid lamp sintering. T.Hara, H.Suzuki, M.Furukawa, K.Amemiya (Electrical Engng., Hosei Univ., Tokyo, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.6, p.L340-2 (June 1983).
Reduction of contact resistance was achieved in Al/Si ohmic electrodes sintered by halogen lamp rapid heating. Contact resistance measurements were made for the electrodes formed on highly doped shallow *p*-Si layers, where lamp sintering was performed at 450°C. The contact resistance was low and uniform within a wafer when compared with that for conventional furnace sintering. A specific contact resistance of 4.0×10^{-6} Ohm-cm^2 was achieved for p^+ layers. The Al spikes and Si precipitates could be markedly reduced in this short time sintering. (10 refs.)

108550 Fermi-level pinning energy and chemistry at InP (100) interfaces. J.R.Waldrop, S.P.Kowalczyk, R.W.Grant (Microelectronics Res. & Dev. Center, Rockwell Internat., Thousand Oaks, CA, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.628-9 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Summary form only given. X-ray photoemission spectroscopy (XPS) has been used to correlate the interface Fermi-level pinning energy E_F^i and the corresponding interface chemistry for *n*-and *p*-type InP(100) samples simultaneously subjected to a series of surface treatments. Metals (Al and Au) were evaporated in a sequence of thin deposits onto both chemically etched and thermally cleaned surfaces. The interface chemistry was primarily observed from the chemical shifts associated with In 3*d*, P 2*p*, Al 2*p*, and Au 4*f* XPS core-level spectra. The value of E_F^i at an interface was found by measuring the potential shift in binding energy of the P 2*p* core level in InP that occurred as a result of a given surface treatment. (7 refs.)

108551 Ohmic contacts to GaAs and $Ga_xAl_{1-x}As$. N.Braslau (IBM Watson Res. Center, Yorktown Heights, NY, USA).
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.700-1 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Summary form only given. The increasing performance and decreasing size of III-V semiconducting devices have called attention to the less than satisfactory nature of ohmic contacts in these structures. The author finds them contributing unwanted parasitic resistance, difficult to fabricate reproducibly, and are the major source of poor aging characteristics. Present device technology calls for such contacts to be linear with applied voltage, noninjecting, stable with time, and with fabrication compatible with other processing steps, all for a five decade range of semiconductor doping. The major source of difficulty is the presence of surface depletion layers due to Fermi level pinning by surface states near midgap which are normally present on polished and chemically cleaned wafers. (18 refs.)

108552 A study of tunnel-thermoemission currents through metal-semiconductor structures with a gap. A.N.Zyuganov, P.S.Smertenko.
Optoelektron. & Poluprovodn. Tekh. (USSR), no.1, p.87-92 (1982). In Russian.
The study is aimed at determining the behaviour of a mean transparency factor in the region of fields up to the beginning of strong autoelectronic emission of carriers from the metal and the formulation on this basis of main approximations on the theory of metal-semiconductor contacts with a tunnel-emission mechanism of passage through a barrier. It is shown that with wide gaps, but not exceeding 10^{-6} cm, the mean transparency factor is equal to the transparency factor at an energy level equal to the height of the precontact barrier, and an expression is defined for the transparency factor in a quasiclassical approximation. The height of the barrier at the In-CdS interface approximation is determined from the volt-ampere characteristic for the In-CdS-In structure. It is shown that the electron affinity in CdS can be determined from the value of the transparency factor. (13 refs.) *N.F.S.*

108553 A complex impedance study of Pt|NaCl and C|NaCl interfaces. S.Lanyi (Inst. of Phys., Slovak Acad. of Sci., Bratislava, Czechoslovakia), K.Hricovini.
J. Phys. & Chem. Solids (GB), vol.44, no.9, p.905-12 (1983).
The AC impedance of Pt|NaCl|Pt and C|NaCl|C cells was measured in the frequency range from 10^{-3} to 10^3 Hz. Two contributions to the interface impedance could be distinguished, hindered charge transfer and an adsorption/desorption or slow reaction contribution, the latter being the rate determining step in the frequency range studied. An approximately symmetric nonlinear dependence of both the capacitance and the conductance on overvoltage was found at the lowest frequencies, indicating that the crystal/electrode interface is in a state which can be characterized as close to equilibrium. It should be ensured by two electrochemical reactions of approximately equal rates. The concept of a temporarily reversible electrode is introduced. It is a result of the ability of ions to discharge at the interface and to produce a finite reservoir of adsorbed or absorbed reaction products. An external voltage increases or reduces this reservoir, and therefore only a transient electric current may be carried by a backward reaction. (39 refs.)

108554 Fermi-level position at a semiconductor-metal interface. A.Zur, T.C.McGill, D.L.Smith (Thomas J. Watson, Sr. Lab. of Appl. Phys., California Inst. of Technol., Pasadena, CA, USA).
Phys. Rev. B (USA), vol.28, no.4, p.2060-7 (15 Aug. 1983).
The authors investigated the phenomenon of Fermi-level pinning by charged defects at the semiconductor-metal interface. Two limiting cases were investigated. In the first case they modeled an infinitely thick metallic coverage. In the second case they modeled a submonolayer coverage by using a free semiconductor surface containing defects. In both cases they assumed that most of the defect-induced interface states are localized inside the semiconductor, not more than a few angstroms away from the metal. Under these conditions they have estimated the difference in Fermi-level position between *n*- and *p*-type semiconductors to be less than 0.05 eV in the case of a thick metallic coverage. This difference was shown to be the maximum possible one, and it occurs only when there is no pinning. When there is pinning, this difference is

even smaller. No such upper bound on the difference in Fermi-level position exists in the case of submonolayer coverage. They have also found that the defect density required to pin the Fermi level is $\sim 10^{14}$ cm^{-1} in the case of a thick metallic coverage, but only $\sim 10^{12}$ cm^{-1} in the case of a submonolayer coverage. (15 refs.)

108555 Properties of metal semiconductor contacts. I. Voltage-current characteristics of contacts on intrinsic semiconductors. J.-C.Manifacier, Y.Moreau, H.K.Henisch (Dept. of Phys. & Materials Res. Library, Pennsylvania State Univ., University Park, PA, USA).
Solid-State Electron. (GB), vol.26, no.8, p.795-9 (Aug. 1983).
In the general case (two carriers, arbitrary lifetime, arbitrary dielectric relaxation time), the transport equations relating to barrier characteristics have to be solved by numerical methods. The single-carrier case is already (abundantly) familiar, but the two-carrier case can also be solved explicitly. However, the solution is simple only for contacts on high lifetime intrinsic material. Such a solution is here obtained by conventional analytic methods, based on the diffusion theory and resonable approximations, and is compared with computed results obtained on the complete (unapproximated) system. Analysis and computation lead to new and hitherto unrecognized dependence of the current on the applied voltage across the barrier in accordance with $\exp[2qV_a/kT]$, instead of the more familiar $\exp[qV_a/kT]$. 73.40Q Metal-insulator-semiconductor structures

(inc. semiconductor-to-insulator)

108556 Experimental verification of electron-hole recombination theory for Si-SiO$_2$ interface traps with nonequilibrium, steady-state, admittance measurements. A.K.Agarwal, F.M.Rhodes, M.H.White (Shermann Fairchild Lab., Lehigh Univ., Bethlehem, PA, USA).
Appl. Phys. Lett. (USA), vol.43, no.5, p.465-7 (1 Sept. 1983).
An analytical and experimental study of deep level Si-SiO$_2$ interface traps is presented for small-signal, admittance measurements on a gated-diode structure. This technique eliminates the minority-carrier capture process and allows the competing emission process to dominate near the middle of the Si band gap. First-order rate kinetics has been employed to predict the behaviour of the nonequilibrium, steady-state, occupancy function and 'trap conductance' for states in the midgap region. Theory predicts and experimental measurements verify a sudden decrease or 'pinning' of the trap conductance. Their ratio of electron to hole capture cross sections, $R=\sigma_n/\sigma_p$, has a pronounced influence on the trap energy associated with the onset of 'pinning', $U_{TP}={}^1/_2\ln(R)$. (6 refs.)

108557 Measurements of capture cross section of traps in insulating films by photoinjection current decay. Shi Changxin, Gu Weifang (Shanghai Inst. of Metallurgy, Acad. Sinica, Beijing, China).
Chin. J. Semicond. (China), vol.4, no.4, p.383-8 (July 1983). In Chinese.
The external circuit current of photoinjection in MOS structures is closely related to the capture cross section of traps. The dependence of external circuit current decay on time is given. Therefore, the capture cross section of traps can be measured easily. This method can be used in metal-insulator-metal (MIM) structures without silicon substrate. (7 refs.)

108558 On the contact potential differences in Al-SiO$_2$-Si and Au-SiO$_2$-Si structures. Lu Deren (Shanghai Inst. of Metall., Acad. Sinica, Beijing, China).
Chin. J. Semicond. (China), vol.4, no.4, p.399-402 (July 1983). In Chinese.
The contact potential difference of the MOS-system with aluminium field plates and gold probe electrode is measured by the MOS-capacitance-voltage technique for (100) and (111) oriented n-type as well as p-type silicon slices with thermal SiO$_2$. It can be seen that the contact potential differences measured in this work are about 0.35 V more positive than the values measured by the photoemission technique. It is suggested that the value measured by the MOS-capacitance-voltage technique should be used when the electrical phenomena without light in MOS-system are investigated. (7 refs.)

108559 Native oxide formation and electrical instabilities at the insulator/InP interface. J.F.Wager (Hughes Res. Labs., Malibu, CA, USA), K.M.Geib, C.W.Wilmsen, L.L.Kazmerski.
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.778-81 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
A variety of surface analytical techniques have been employed in an attempt to correlate the chemistry of InP native oxides with electrical interface instabilities observed in InP MIS devices. The native oxides examined were predominantly InPO$_4$ but upon closer examination had small amounts of In$_2$O$_3$ incorporated into the outer oxide surface. The band gap of InPO$_4$ was estimated to be about 4.5 eV, although several observations indicate that this may be only a lower limit. It is suggested that tunneling of electrons from InP through the InPO$_4$ into In$_2$O$_3$ may account for electrical interface instabilities observed in InP MIS devices. (17 refs.)

108560 Surface and interfacial properties of Ga$_{0.47}$In$_{0.53}$As-Al$_2$O$_3$ MIS structures. D.P.Mullin (Electronic Material Sci. Div., Naval Ocean Systems Center, San Diego, CA, USA), H.H.Wieder.
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.782-6 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Field-effect-controlled electrical and galvanomagnetic measurements have been made on transistor like five-terminal metal insulator semiconductor (MIS) structures using n-type 0.25 μm thick Ga$_{0.47}$In$_{0.53}$As epitaxial layers grown on semi-insulating InP substrates. These layers have an electron density $n=3.5\times10^{16}$ cm^{-3} and a mobility $\mu_n=7.5\times10$ cm^2/V-s; 0.13 μm thick Al$_2$O$_3$ dielectric layers, grown by a RF plasma-assisted low temperature chemical-vapor deposition (CVD) process were employed as gate insulators under 0.01 cm^2 vacuum-deposited aluminum gates. Hall effect and resistivity measurements were made on such structures and the experimentally observed gate voltage dependent change in resistivity and Hall coefficient of the conducting channel under the gate have been related to the corresponding change in the depletion depth of the surface space charge region. The data were used to derive the density of the surface states and their position within the fundamental band gap of Ga$_{0.47}$In$_{0.53}$As. The authors find that the surface Fermi level F_F* of virgin MIS structures is pinned $\sim$0.2 eV below the conduction band minimum (0.55 eV above the valence band maximum) of Ga$_{0.47}$In$_{0.53}$As, in agreement with the experimentally measured and theoretically calculated barrier height of metal Ga$_{0.47}$In$_{0.53}$As diodes. (17 refs.)

108561 The effect of low pressure plasma on Si-SiO$_2$ structures and GaAs substrates. Y.Chung, C.Y.Chen (Universal Energy Systems Inc., Dayton, OH, USA), D.W.Langer, Y.S.Park.
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.799-802 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
The degradation of insulating films and GaAs substrates by exposure to low pressure plasma is investigated. In Si-SiO$_2$ structures, the increased density of fast surface states and the nonuniform storage of positive trapped charges within the oxide layer is responsible for the degradation of MOS devices exposed to low pressure plasma. The charge carrier reduction due to the creation of compensating defects during the hydrogen plasma treatment of n-GaAs is reported. (14 refs.)

108562 Surface roughness scattering at the Si-SiO$_2$ interface. S.M.Goodnick, R.G.Gann, J.R.Sites, D.K.Ferry, C.W.Wilmsen (Colorado State Univ., Fort Collins, CO, USA), D.Fathy, O.L.Krivanek.
J. Vac. Sci. & Technol. B (USA), vol.1, no.3, p.803-8 (July-Sept. 1983). (10th Annual Conference on the Physics and Chemistry of Semiconductor Interfaces, Santa Fe, NM, USA, 25-27 Jan. 1983).
Scattering of inversion layer electrons at the oxide semiconductor interface is a major source of mobility degradation in MOSFETs. The authors have studied, on the same sample, high resolution TEM cross sections of the Si-SiO$_2$ interface and detailed temperature dependent electronic and magnetic transport measurements. The experimental mobility data are compared to a model containing terms for surface roughness and impurity scattering including carrier screening. The statistical properties of the interface fluctuations appear as parameters which are adjusted to fit the transport data. While the TEM pictures indicated an interfacial boundary which deviated by only one atomic layer, an assumed peak-to-peak deviation of approximately five atomic layers is required to fit the experimental mobility. Thus, while the overall comparison of the surface parameters suggests that roughness scattering is a plausible mechanism, close agreement between the theory and experiment is not obtained. (19 refs.)

108563 Nature of radiation effects in laminated MOS structures. A review. V.G.Litovchenko.
Optoelektron. & Poluprovodn. Tekh. (USSR), no.1, p.27-35 (1982). In Russian.
Information published since 1968 is discussed under the heading: radiation effects in dielectric phases; interfaces and electrical parameters; and semiconductor layer adjacent to the interface. Diagrams are reproduced showing a schematic representation of surface radiation effects with distortion of the Si-O bond, formation of zones in amorphous SiO$_2$ on interaction of s and p orbitals of Si and O through formation of the SiO$_2$ molecule, and the Lorenz broadening parameter as a function of the coordinates normal to the surface obtained in layer by layer etching of Si implanted with ^{75}As, ^{31}P, and ^{11}B ions. (29 refs.) *N.F.S.*

108564 Calculation of the volt-Faraday characteristics of MOS structures with a Si field electrode. A.V.Nabok, O.S.Frolov.
Optoelektron. & Poluprovodn. Tekh. (USSR), no.1, p.61-6 (1982). In Russian.
It is shown that allowance for the semiconductor properties of a polysilicon field electrode in the calculation of volt-Faraday characteristics of MOS structures leads to a decrease in the maximum capacity of the structure and a displacement of the C-V curves, this displacement increasing with decrease in the concentration of doping impurities in the polycrystalline Si. It is suggested that this could have a significant effect on the operation of instruments based on structures with Si gates, especially at low temperatures, high frequencies of the control signal, and low concentrations of impurities in the polysilicon. (4 refs.) *N.F.S.*

108565 Effects of radiation-thermal factors on the characteristics of semiconductor structures. V.G.Litovchenko, V.Ya.Kiblik, R.O.Litvinov.
Optoelektron. & Poluprovodn. Tekh. (USSR), no.1, p.69-73 (1982). In Russian.
Studies aimed at decreasing the concentration of defects and decreasing the carrier recombination losses in the surface region of Si by means of radiation-thermal methods, and which provide a means of increasing transistor amplification factors over a wide range of collector currents are described. The structures studied are MOS and dielectric semiconductor structures based on p-type Si, and also planar, bipolar high frequency transistors using irradiation with γ rays from a ^{60}Co source or electrons of various energy at 300K.

In the case of the MOS structures the density of surface states in the centre of the forbidden zone $N_{ts}(-u_v)$, the rate of surface generation, S_g, and the generation lifetime of the minority charge carriers t_g are measured. The data lead to the important result that the values of the above three parameters decrease below the initial values, at temperature below 250° in the case of $N_{ys}(-u_v)$ and s_g, and at temperature not less than 300°C in the case of $1/t_g$. The results obtained with MOS are confirmed with low and high power high frequency transistors. (14 refs.) *N.F.S.*

108566 Electrophysical properties of MIS (MOSFET) structures based on indium arsenide. A.A.Shirokov, E.A.Markova, I.S.Zakharov.
Inorg. Mater. (USA), vol.18, no.9, p.1243-7 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1459-63 (Sept. 1982). [received: Sept. 1983]
Metal-insulator-semiconductor structures based on single-crystalline and epitaxial InAs have been obtained using the method of anodic oxidation. It was found that for any of the anodization regimes studied, a positive charge is present in the oxide. The voltage-capacitance characteristics exhibit injection-type hysteresis. The voltage-capacitance characteristics, measured with a bias voltage scanning rate exceeding 0.015 V/sec, are nonequilibrium characteristics. In the depletion region, the capacitance of the structures depends strongly on the light intensity. (5 refs.)

108567 Quasi-classical quantization for potentials with an infinite surface barrier. Subbands in inversion layers. G.Paasch (Tech. Hochschule Ilmenau, Wissenschaftsbereich Phys., Ilmenau, Germany), T.Fiedler, M.Kolar, I.Bartos.
Phys. Status Solidi b (Germany), vol.118, no.2, p.641-52 (1 Aug. 1983).
Quasi-classical quantization schemes are investigated, for potentials with a high surface barrier, WKB and other previous approximations provide good results for the lower eigenvalues in special cases only. Here a modified local density approximation is used for the calculation of the density of states. From the integral density of states a quantization expression is derived where the ground state constant depends explicitly on the shape of the potential. It yields the whole eigenvalue spectrum very precisely for quite different potentials with a surface barrier. The application to subband energies in inversion layers is discussed. (19 refs.)

108568 DLTS investigations of Si-SiO$_2$ interface states of electron-beam irradiated MOS structures. K.Hubner (Sektion Phys., Wilhelm-Pieck-Univ. Rostock, Rostock, Germany), H.Koster,Jr., B.Derlich, W.Ecke.
Phys. Status Solidi b (Germany), vol.118, no.2, p.K133-6 (1 Aug. 1983).
The constant-capacitance DLTS (CC-DLTS) can be used to get very direct information about semiconductor-insulator interface states of metal-oxide-semiconductor (MOS) structures. The authors present results of CC-DLTS investigations of MOS structures, which show the influence of electron-beam irradiation on the spectrum of interface states in the silicon gap at the Si-SiO$_2$ interface. They lead to a clear identification of a special interface state as a radiation induced one. (9 refs.)

108569 Nonstoichometric germanium nitride. A new insulating material for MIS microelectronics. II. Composition, properties, and the interface with a semiconductor. G.D.Bagratishvili, R.B.Dzhanelidze, D.A.Jishiashvili (Inst. of Cybernetics, Acad. of Sci., Tbilisi, Georgian SSR).
Phys. Status Solidi a (Germany), vol.78, no.2, p.391-400 (16 Aug. 1983).
For pt.1 see ibid., vol.78, p.118 (1983). The optical and electrical properties of nonstoichiometric germanium oxynitrides and their interfaces with a semiconductor are discussed depending on their composition. The band gap, dielectric constant, and refractive index of the films obtained are shown to depend linearly on the oxygen content. The nonstoichiometric germanium oxynitride-semiconductor (GaAs, Si, Ge) interface is characterized by a low surface state density, lack of hysteresis, and frequency dispersion of the *C-U* characteristics and a high stability to the bias-temperature treatment. (18 refs.)

108570 Two-dimensional versus three-dimensional motion of inversion electrons in a magnetic field. J.H.Crasemann, U.Merkt, J.P.Kotthaus (Inst. fur Angewandte Phys., Univ. Hamburg, Hamburg, Germany).
Phys. Rev. B (USA), vol.28, no.4, p.2271-3 (15 Aug. 1983).
The infrared absorption of inversion electrons on InSb is measured in a magnetic field parallel to the inversion layer. The experimental results are explained by a simple model of surface electrons in crossed electric and magnetic fields. The dependence on resonance magnetic field and electron density shows a transition from two-dimensional- (2D) to 3D-like motion of the electrons. (17 refs.)

108571 Non-equilibrium properties of MIS capacitor under illumination conditions. S.Krawczyk (Politech. Warsaw, Warsaw, Poland).
Rozpr. Electrotech. (Poland), vol.28, no.1-2, p.219-31 (1982). In Polish. [received: Aug. 1983]
A qualitative and quantitative analysis of non-equilibrium properties of MIS capacitor under illumination conditions is presented. (16 refs.)

108572 Rapid interface parameterization using a single MOS conductance curve. J.R.Brews (Bell Labs., Murray Hill, NJ, USA).
Solid-State Electron. (GB), vol.26, no.8, p.711-16 (Aug. 1983).
Figures are presented for finding interface trap density D_{it}, capture probability c_p, and interfacial broadening σ_s, from a single curve of small-signal MOS interface trap conductance G_{it}/ω vs. either band bending v_s, or frequency $f[\omega=2\pi f]$. Almost no computation is necessary. An additional figure allows the depletion layer capacitance to be determined if the oxide capacitance and the measured capacitance at the maximum value of G_{it}/ω are known. The extension to G_{it}/ω vs. v_s curves is a convenience. Parameters throughout the bandgap can be obtained from measurements at fewer frequencies than are needed for construction of accurate G_{it}/ω vs. f curves. Economy also results because data usually are obtained by sweeping gate bias at selected frequencies. Construction of G_{it}/ω vs. v_s curves from the data is simpler than G_{it}/ω vs. f, particularly if v_s is measured directly. The information needed from the G_{it}/ω curve is the maximum value of G_{it}/ω and the width of the peak at an arbitrary fraction of its maximum value, f_w. In addition, for capture probability only, the frequency and band bending at the peak maximum are needed, as well as the bulk doping. The method assumes validity of the Gaussian approximation to broadening of the conductance peak. Comparison of the parameters obtained for several choices of f_w allows a check of this assumption, which usually is valid for MOS devices. (11 refs.)

108573 Low-intensity differential photocapacitance of MOS structures. M.M.Chandra, G.Suryan (Dept. of Phys., Indian Inst. of Sci., Bangalore, India).
Solid-State Electron. (GB), vol.26, no.8, p.731-7 (Aug. 1983).
Some new observations on the phenomenon of photocapacitance on *n*-type silicon MOS structures under low intensities of illumination are reported. The difference between the illuminated and dark C-V characteristics is automatically followed as a function of the applied bias thereby obtaining the differential photocapacitance and the resulting characteristics has been termed as the Low Intensity Differential Photocapacitance (LIDP). For an MOS capacitor, the LIDP characteristics is seen to go through a well defined maximum. The phenomenon has been investigated under different ambient conditions like light intensity, temperature, dependence of the frequency of the light etc., and it has been found that the phenomenon is due to a band to band excitation. In this connection, a novel sensitive technique for the measurement of the capacitance based upon following the frequency changes of a tank circuit is also described in some detail. It is also shown that the phenomenon can be understood by a simple theoretical model. (13 refs.)

108575 Electrical properties of Pd-CdTe-Pd structures. H.Meczynska, W.Bala (Inst. of Phys., Nicholas Copernicus Univ., Torun, Poland).
Acta Phys. Pol. A (Poland), vol.A64, no.2, p.167-76 (Aug. 1983).
The current-voltage, capacitance-voltage and resistivity-voltage characteristics of metal-semiconductor-metal structures are studied. Experimental Pd-CdTe-Pd structures are made of *p*-type CdTe doped with phosphorus. A theoretical treatment of the current transport in the structures based upon the application of the double Schottky diode model is given. Good agreement is obtained between the experimental results and theoretical predictions. (26 refs.)

108576 Surface plasmons studies of oxidized Ba films. J.W.Gibson, R.E.Thomas (US Naval Res. Lab., Washington, DC, USA).
Appl. Surf. Sci. (Netherlands), vol.16, no.1-2, p.163-80 (May-June 1983). (3rd Tri-Service Cathode Workshop, Fort Monmouth, NJ, USA, 23-26 March 1982).
Electron loss spectroscopy studies of both monolayer and thick ($\geq$40 Å) Ba films on W and Ir show that the different states of oxidation of these films can be characterized by the energy of the Ba surface plasmon loss peak. Consistent with other studies of the surface plasmons of alkali metal films, the reduction in energy upon oxidation is interpreted as a removal of free electrons from the surface Ba to localized oxygen bonds. Although the Ba surface plasmon is lost with heavy oxidation, it still exists on both well activated thick oxide and dispenser cathodes, indicating that the surface Ba on these cathodes remains partially metallic. Using free electron theory to estimate the Ba-O charge transfer a semiquantitative evaluation of the Ba-O dipole is made, assuming the Helmholtz equations applies. The results imply that the plane of the surface Ba is $\leq$0.1 Å above the plane of the oxygen on the surface for both dispenser and oxide cathodes. This is contrary to recent interpretations of angle dependent Auger measurements on dispenser cathodes which suggest that Ba lies significantly above the oxygen on these surfaces. In general, it is demonstrated that the surface plasmon technique provides a means of evaluating the surface chemistry of cathodes that is much more surface sensitive than other electron spectroscopy methods commonly used. (23 refs.)

108577 Poly(1,6-heptadiyne), a free-standing polymer film dopable to high electrical conductivity. H.W.Gibson, F.C.Bailey, A.J.Epstein, H.Rommelmann (Webster Res. Center, Xerox Corp., Webster, NY, USA), S.Kaplan, J.Harbour, X.-Q.Yang, D.B.Tanner, J.M.Pochan.
J. Am. Chem. Soc. (USA), vol.105, no.13, p.4417-31 (29 June 1983).
Polymerization of 1,6-heptadiyne on the surfaces of concentrated solutions of homogeneous Ziegler-Natta catalysts leads to insoluble, free-standing films with metallic luster. 'Doping' of these films by treatment with acceptors results in conductivities up to 1 S/cm. The polymer has been characterized in terms of its molecular structure, its solid-state structure and physical properties, the nature of the doping process, and its thermal and oxidative stability. Poly(1,6-heptadiyne) provides a number of contrasts to polyacetylene in its molecular and solid-state structure which yield some information about the requirements for conductive polymers. 108578 Electron-beam-induced current measurements in silicon-on-insulator films prepared by zone-melting recrystallization. E.W.Maby, H.A.Atwater, A.L.Keigler (MIT, Cambridge, MA, USA), N.M.Johnson.
Appl. Phys. Lett. (USA), vol.43, no.5, p.482-4 (1 Sept. 1983).
Enhanced diffusion of arsenic along grain boundaries and subboundaries in zone-recrystallized silicon-on-insulator films has been measured by electron-beam-induced current analysis of lateral *pn* junctions fabricated in the films. A four-hour diffusion at 1100°C resulted in protrusions of arsenic at the junction edges which measured approximately 3-5 μm along the grain boundaries and only 1-2 μm along the subboundaries. The results suggest that under more ordinary thermal processing conditions, field-effect transistors with channel lengths greater than about 1.5 μm can be randomly positioned with respect to the more numerous subboundaries, but grain boundaries should be avoided. (15 refs.)

108579 Properties and ion implantation of $Al_xGa_{1-x}N$ epitaxial single crystal films prepared by low pressure metalorganic chemical vapor deposition. M.R.Kahn, R.A.Skogman, R.G.Schulze (Honeywell Corp. Technol. Center, Bloomington, MN, USA), M.Gershenzon.
Appl. Phys. Lett. (USA), vol.43, no.5, p.492-4 (1 Sept. 1983).
High quality single crystal films of $Al_xGa_{1-x}N$ have been grown on sapphire substrates using low pressure metalorganic chemical vapor deposition at 915°C over the entire range of x. Electrical and optical properties of the layers were measured. Electrical compensation by Be^+ and N^+ implants in the layers was studied. Schottky barriers were fabricated and their current-voltage characteristics were studied. The authors also report some initial results of a study of GaN growth kinetics. (8 refs.)

108580 Epitaxial layers of iron-doped gallium arsenide. N.A.Chernov, N.N.Bakin, M.D.Vilisova.
Inorg. Mater. (USA), vol.18, no.9, p.1237-40 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.,* vol.18, no.9, p.1452-5 (Sept. 1982). [received: Sept. 1983]
The results obtained reveal that epitaxial GaAs layers, which were produced in a $Ga\text{-}AsCl_3\text{-}H_2$ system with an Fe+HCl dopant line, have semiconducting properties controlled by the inclusion of iron impurity in the growing layers. When growth of epitaxial gallium arsenide is carried out on a low resistance substrate with simultaneous tin and iron doping a π-ν transition occurs whose parameters are determined by properties of the transition region near the film-substrate boundary. (3 refs.)

108581 A study of the Hall coefficient and electrical conductivity of thin CdHgTe films subjected to laser irradiation. N.N.Vasyuk, A.A.Druzhinin, G.A.Ilchuk, R.V.Lutsiv, P.A.Pavlishin.
Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1218-20 (Aug. 1983). In Russian.
Temperature dependences of the Hall coefficient and electrical conductivity of $p\text{-}Cd_xHg_{1-x}Te$ $(0.18 \leq x \leq 0.35)$ thin films were experimentally investigated before and after laser treatment. Such dependences in irradiation samples are due to formation of the structure defects produced by short time annealing by laser pulses. (4 refs.)

108582 Electrical characteristics and device applications of zone-melting-recrystallized Si films on SiO_2. B.-Y.Tsaur, J.C.C.Fan, M.W.Geis, R.L.Chapman, S.R.J.Brueck, D.J.Silversmith, R.W.Mountain (Lincoln Lab., MIT, Lexington, MA, USA).
Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.593-603
Device-quality Si films have been prepared by using graphite-strip heaters for zone melting poly-Si films deposited on SiO_2-coated substrates. The electrical characteristics of these films have been studied by the fabrication and evaluation of thin-film resistors, MOSFETs and MOS capacitors. High yields of functional transistor arrays and ring oscillators with promising speed performance have been obtained for CMOS test circuit chips fabricated in recrystallized Si films on 2-inch-diameter Si wafers. Dual-gate MOSFETs with a three-dimensional structure have been fabricated by using the zone-melting recrystallization technique. (17 refs.)

108583 On the a.c. conduction in evaporated SiO films. A.Kondo, K.Shimakawa, Y.Inagaki (Dept. of Electronics, Gifu Univ., Gifu, Japan).
J. Phys. C (GB), vol.16, no.26, p.5211-16 (20 Sept. 1983).
It is now well established that the intrinsic bonding defects in amorphous SiO_2 are normally charged (C_1^- with negative correlation energy and C_3^+ with positive correlation energy) and that they are different from those for amorphous chalcogenides. Intrinsic defects similar to those in amorphous SiO_2 are expected to exist and contribute to a.c. conduction in amorphous SiO films. It is proposed here that the a.c. conduction in evaporated SiO films can be interpreted, using this model based on intrinsic bonding defects, in terms of correlated barrier hopping by single polarons (i.e. one-hole hopping between neutral and negatively charged defects). The expression obtained for the a.c. conductivity agrees with the experimental results. The densities of the defects are estimated from the model, and the results are supported by results from studies using ESR signals. (17 refs.)

108584 A study of the electrical characteristics, before electroforming, of thin SiO_x films with laterally-spaced electrodes. S.A.Y.Al-Ismail, C.A.Hogarth (Dept. of Phys., Brunel Univ., Uxbridge, England).
J. Mater. Sci. (GB), vol.18, no.9, p.2777-84 (Sept. 1983).
The sample structure comprises two laterally-spaced electrodes joined by a thin dielectric film. The electrodes make a blocking contact to the dielectric with a barrier height ~0.75 eV. The voltage-current characteristic is studied between 213 to 413K. Below room temperature the effect of hopping conduction on such contacts is explained. At room temperature and at high fields where hopping conduction is expected to be less effective, the conduction is controlled by the contact. Above room temperature and at low fields localized state conduction (hopping) becomes effective again with activation energy ~0.07 eV and an estimated charge carrier mobility of 1.3×10^{-2} cm^2 V^{-1} sec^{-1}. The density of ionizable impurities is estimated to be in the range 1 to 6×10^{18} cm^{-3} and the density of surface states is of the order of 1×10^{13} cm^{-2}. (15 refs.)

108585 Study of the surface potential decay characteristics in cellulose acetate films. A.Kumar, R.Nath (Dept. of Phys., Univ. of Roorkee, Roorkee, India).
J. Electrostat. (Netherlands), vol.14, no.2, p.201-8 (Aug. 1983).
The surface potential decay characteristics of corona charged cellulose acetate films have been investigated as a function of charging time, initial surface potential, thickness and voltage polarity. Some of these studies have also been performed on iodine doped (2%wt/wt) cellulose acetate films. The carrier mobility has been calculated from these measurements and comes out to be 1.96×10^{-9} cm^2 V^{-1} s^{-1} for pure cellulose acetate films. It has been found that the carrier mobility increases to 6.0×10^{-6} cm^2 V^{-1} s^{-1} by iodination. (18 refs.)

74.00 SUPERCONDUCTIVITY

74.10 OCCURRENCE, CRITICAL TEMPERATURE

108586 A study on the superconductivity of fast quenched Al-Si-Ge alloy. Chen Xi-chen, Guan Wei-yan, Yi Sun-sheng, Wang Zu-lun, Lin Ying (Inst. of Phys., Acad. Sinica, Peking, China).
Acta Phys. Sin. (China), vol.32, no.4, p.446-59 (April 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)* [received: Sept. 1983]
The effect of heat treatment on the microstructure and superconducting properties of the alloy Al-8.3 at.% Si-8.5 at.% Ge prepared by the splat quenching technique has been studied. The results of structure analyses indicate that the rapidly cooled alloy consists of two phases: a supersaturated α-Al (Si, Ge) solid solution (matrix) and amorphous Al-Si-Ge spheres, these spheres connect with each other and form a continuous canal. After annealing at 100°C for 50 h the spheres decrease in size, the continuous canal disappears and some dispersive Si (Ge) granules separate out from the amorphous phase. Two superconducting-normal transitions have been found in the resistance-temperature and resistance-magnetic field curves of the sample after annealing at 100°C for 50 h. These results can be interpreted by the existence of two superconducting phases in this sample. (9 refs.)

108587 The research of superconductivity in the Ti-Pd system. Luo Qi-guang, Jin Duo, Liu Zhi-yi, Ran Qi-ze, Jin Zuo-wen, Ma Ming-rong, Zhao Zhong-xian, Ni Yong-ming (Inst. of Phys., Acad. Sinica, Peking, China).
Acta Phys. Sin. (China), vol.32, no.4, p.534-8 (April 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)* [received: Sept. 1983]
This paper gives the relationship between the superconductive critical temperature and the composition of the alloys in Ti-Pd system, and discusses it in connection with the Ti-Pd phase diagram. It is pointed out that the supercon-

ductivity in the Ti-Pd system is due to the contribution of the titanium-palladium solid solution. It is also suggested that the limit of the palladium solubility in Ti-Pd system should be relatively large. (13 refs.)

108588 Effect of some preparation conditions upon properties of sputtered Nb_3Ge films. M.Jergel (Electrotech. Inst., Czechoslovak Acad. of Sci., Bratislava, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.9, p.1035-43 (1983).
Influence of some parameters of preparation upon properties of Nb_3Ge films has been investigated. The results concerning the influence of substrate temperature, oxygen content and initial amorphous interlayer upon T_c values are shown. The importance of the initial amorphous state is emphasized. (15 refs.)

108589 Fabrication of NbN films by DC bias sputtering and their application to superconducting bridges. T.Goto, P.Anprung (Univ. of Electro-Communications, Tokyo, Japan).
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.955-9 (June 1983).
NbN thin films have been prepared by the double cathode DC reactive sputtering method. The effect of the substrate bias and the nitrogen partial pressure on the films' resistivity and superconducting transition temperature were investigated. A high critical temperature of around 16K was obtained for 300 nm films made at about −80 V substrate bias voltage and suitable nitrogen partial pressure. The thickness dependence of the films' critical temperature was determined for film thickness down to 5 nm. NbN variable thickness bridges with length of about 0.2 μm were fabricated and shown to be feasible for use as Josephson devices. Microwave induced steps were observed over the bridges' *I-V* characteristics over rather narrow temperature ranges. (19 refs.)

108590 Superconductivity of gallium nitride. V.S.Kravchenko, M.Z.Graifer, M.A.Starikov, A.G.Klimenko (Inst. of Inorganic Chem., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.8, p.1105-8 (Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.8, p.1308-11 (Aug. 1982).
Magnetic measurements, X-ray diffraction analysis, and electron microscopy indicates that the previously discovered superconductivity of gallium nitride synthesised at high temperatures is due to the presence of finely dispersed metallic gallium inclusions. Dispersed gallium in samples of the Ga-GaN system was found to exhibit up to three superconducting transitions (6.2, 7.3, and 7.7K) corresponding to its metastable modifications. Pure gallium nitride at normal pressure showed no superconductivity down to 1.5K. (21 refs.)

108591 Coexistence of antiferromagnetism and superconductivity in CrRe alloys. Y.Nishihara, Y.Yamaguchi, S.Waki, T.Kohara (Electrotech. Lab., Ibaraki, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2301-3 (July 1983).
Magnetic susceptibility, electrical resistivity and nuclear magnetic resonance measurements strongly suggest that itinerant-electron antiferromagnetism and superconductivity coexist in non-annealed (strained) BCC CrRe alloys with Re concentration of more than 17%. The Neel temperature is ~160K and the superconducting transition temperature is typically ~3K. (7 refs.)

108592 Superconducting properties of disordered films of Zn. S.Okuma, F.Komori, Y.Ootuka, S.Kobayashi (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2639-41 (Aug. 1983).
The superconducting transition temperature T_c and the critical magnetic field H_c of thin Zn films were measured. T_c decreases almost linearly as the normal-state sheet resistivity increases. $H_c(T)$ is enhanced compared with the conventional value for dirty superconductors. These results are explained by the localization and electron-electron interaction theories for two-dimensional disordered superconductors. (5 refs.)

108593 Ferromagnetism and superconductivity down to 0K in b.c.t. $ErRh_4B_4$. J.L.Genicon, A.Sulpice, R.Tournier (Centre de Recherches sur Les Tres Basses Temperatures, CNRS, Grenoble, France), B.Chevalier, J.Etourneau.
J. Phys. Lett. (France), vol.44, no.17, p.L725-32 (1 Sept. 1983).
The authors have prepared $ErRh_4B_4$ compounds with the body centred tetragonal structure (b.c.t.) of $LuRu_4B_4$ type using carbon doping. The superconductivity exists from 7.5K down to 0K. The simultaneous presence of ferromagnetism is shown by a jump in the thermal variation of the frozen flux obtained after decreasing the magnetic field from above H_{c2} and by the rectangular shape of the magnetization hysteresis. These effects give some new investigative tools for finding new ferromagnetic superconductors. (16 refs.)

108594 Phase transitions in compounds of rare-earth metals. A.V.Vedyaev, M.A.Savchenko, L.V.Panina (Dept. of Magnetism, Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.5, p.23-8 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.5, p.22-7 (1982).
The structure of the heterogeneous superconducting state is investigated on the basis of the Yang-Mills gauge-field theory. Taking magnetic fluctuations into account leads to an eddy structure different from the structure in usual superconductors of the second type. The flux quantum of this eddy is calculated. In the system, phase transitions from one heterogeneous superconducting state to another are possible; these are found to be phase transitions of the first type, close to the second type. (9 refs.)

108595 Superconductivity and magnetism in ternary rare-earth compounds. H.A.Mook, O.A.Pringle (Oak Ridge Nat. Lab., Oak Ridge, TN, USA), S.Kawarazaki, S.K.Sinha, G.W.Crabtree, D.G.Hinks, M.B.Maple, Z.Fisk, D.C.Johnston, L.D.Woolf, H.C.Hamaker.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.197-201 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Superconductivity and magnetism are two types of order that can take place in materials at low temperatures. When the magnetic order is ferromagnetic a competition exists between magnetism and superconductivity. Neutron scattering has been used to measure the interaction of magnetism and superconductivity in a series of ternary rare-earth alloys. A wide range of behavior is found near the magnetic transition including mean-field magnetic ordering, first-order transitions between magnetism and superconductivity, and coexistence of ferromagnetism and superconductivity with a sinusoidally-modulated magnetic phase. (15 refs.)

108596 Superconducting transition temperature in anodized aluminum. C.Leemann, J.H.Elliott, G.Deutscher, R.Orbach (Dept. of Phys., Univ. of California, Los Angeles, CA, USA), S.A.Wolf.
Phys. Rev. B (USA), vol.28, no.3, p.1644-5 (1 Aug. 1983).
The authors have measured the superconducting transition temperature of anodized aluminum films of grain sizes ranging from less than 100 to 3000 Å. The transition temperature is 1.8K for films of grain size 100 Å and decreases monotonically with increasing grain size to 1.2K for 3000-Å grains. The effect depends only on the volume of the grains. (7 refs.)

108597 Transition temperature in sodium tungsten bronzes. R.Salchow, R.Liebmann, J.Appel (I Inst. Theoretische Phys., Univ. Hamburg, Hamburg, Germany).
Solid State Commun. (USA), vol.47, no.9, p.727-9 (Sept. 1983).
The superconduction transition temperature $T_c(x)$ in the tetragonal I-phase of sodium tungsten bronzes, Na_xWO_3, is explained in terms of the x-dependence of a simple model dielectric-constant. (7 refs.)

108598 Metal-nonmetal transition and superconductivity in frozen tin-hydrogen films. R.Ludwig, H.Micklitz (Inst. fur Experimentalphys. IV, Ruhr-Univ. Bochum, Bochum, Germany).
Solid State Commun. (USA), vol.47, no.10, p.851-4 (Sept. 1983).
The authors have studied the DC-conductivity σ and the superconducting transition temperature T_c frozen mixtures of Sn and molecular H_2 (Sn-H_2) or atomic H(Sn-H). The samples were prepared by co-deposition of Sn and H_2 (H) onto a sapphire substrate held at temperature of about 5K. Both systems show quite different behaviour. While the Sn-H_2 system exhibits a metal-insulator transition at $c(H_2)=0.6$ which agrees well with percolation theory, the Sn-H samples show a metal-semiconductor transition already at $c_H \simeq 0.32$. Both systems have an increased T_c in the metallic region. H_2 seems to be mobile in Sn-H_2 films even down to 5K after annealing of the samples at 10K. Atomic H, on the other hand, is bound up to $T \simeq 200K$. (16 refs.)

74.20 THEORY

108599 Remarks on the stability conditions in a superconducting system. R.Gonczarek (Inst. of Phys., Tech. Univ. of Wroclaw, Wroclaw, Poland).
Acta Phys. Pol. A (Poland), vol.A64, no.2, p.225-37 (Aug. 1983).
The universal properties of the autocorrelation functions are given and discussed with respect to the stability of the system. It has been checked that the obtained conditions are always fulfilled by density, transverse current and spin density autocorrelation functions of the superfluid systems. (14 refs.)

108600 Numerical analysis for nonlinear equation of evolution in nonequilibrium systems—diffusive instability of quasiparticles and their time evolution in nonequilibrium superconductors. F.Takayama, H.Akoh, K.Kajimura (Electrotech. Lab., Ibaraki, Japan).
Bull. Electrotech. Lab. (Japan), vol.47, no.4, p.225-49 (1983). In Japanese.
Inhomogeneous states in a one-dimensional nonequilibrium superconductor have been studied by numerical analysis for the modified Rothwarf-Taylor equation combined with a phenomenological μ^* model. In order to analyze the time evolution of equation under a one-dimensional periodic boundary condition, suitable difference schemes for calculation time, accuracy, and stability are proposed. Using these schemes of the equations, two analyses are carried out for lead as a physical material. The first analysis involves the solution of time evolution of equation for various injection levels of quasiparticles in the superconductor. The results show that an initial cosine perturbation with unstable wave numbers for which an eigenvalue is a positive maximum in a linear stability analysis, evolves with time, resulting in the inhomogeneous steady state. On the other hand, an initial state with stable wave numbers for which an eigenvalue is a negative maximum, decays and converges to the characteristic solution of equation. (30 refs.)

108601 Phonon dynamics in superconductors. Y.Kurihara (Inst. de Fisica 'Gleb Wataghin', Univ. Estadual de Campinas, Campinas, Brazil).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2499-503 (July 1983).
A theory of phonon dynamics of superconductors is presented on the basis of a Hamiltonian which includes the bare Coulomb interaction term and the bare ion frequency term. A diagram method which corresponds to the random phase approximation is adopted. This theory can provide a basis for discussions of anomalies of the phonon structure. In connection with anomalous aspects of phonon dynamics there exist several works in which anomalies directly reflect the singular behavior of the proper polarization function of the density fluctuation in the superconducting case. These works are criticized through the present theory. (14 refs.)

108602 Microscopic two-fluid model in superconductivity theory. V.I.Yaroslavtsev (Dept. of Quantum Statistics & Field Theory, Moscow Univ., Moscow, USSR).
Moscow Univ. Phys. Bull. (USA), vol.37, no.5, p.63-7 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.5, p.56-60 (1982).
On the basis of an approach associated with the concept of Bogolyubov quasimeans, a model is proposed allowing the coexistence of normal and superconducting components in superconductors at subcritical temperatures to be described. The corresponding phase concentrations are determined in a self-consistent manner as a function of the temperature and the parameters of the interaction. In the approximation of strong-pairing and constant four-fermion interaction, expressions are obtained for the phase concentrations and order parameter. The difference from the standard BKSh theory is considered. (20 refs.)

108603 Anderson localization and energy gap in two-dimensional superconductors. H.Takagi, Y.Kuroda (Dept. of Phys., Nagoya Univ., Nagoya, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.6, p.1677-85 (June 1983).
Effects of the Anderson localization on energy gap Δ in two-dimensional dirty superconductors are investigated theoretically. It is shown that Δ is suppressed by the interplay of the Coulomb repulsive interaction and impurity scattering. However, as long as the impurity scattering is weak, it is proved definitely that Δ remains finite at any temperature below the transition temperature, that is, the superconductivity is always stable against the Anderson localization. (10 refs.)

108604 Nonequilibrium superconductor. I.Iguchi.
Solid State Phys. (Japan), vol.18, no.5, p.245-54 (May 1983). In Japanese.
Nonequilibrium superconductivity induced by tunnel injection of quasiparticles is reviewed. Discussions are specially focused on problems of inhomogeneous gap states and branch imbalance. (44 refs.)

74.30 GENERAL PROPERTIES

108605 Electrophysical properties of Nb and Nb nitride deposited in a getter magnetron discharge device. V.L.Noskov, I.V.Sereda, I.D.Voitovich, V.A.Komashko.
Optoelektron. & Poluprovodn. Tekh. (USSR), no.1, p.54-7 (1982). In Russian.
The electrophysical properties of superconducting films of Nb and Nb nitride deposited with a flat cathode mounted in a vacuum chamber are studied by means of volt-ampere characteristics. With increase in magnetic induction the volt-ampere characteristic becomes steeper and is displaced into the low voltage region. Over the voltage range 400-800 V it shows linear sections. Above 800 V there is a tendency to saturation. An increase in induction of more than 0.1 T does not affect the volt-amp characteristic significantly, but results in focusing of the electrons in the substrate region. Films of Nb are obtained at $P_{ar}=0.04$ Pa and films of Nb nitride in a mixture of nitrogen and argon $P_{ar}/P_{N(2)}\approx 3$ at a total pressure of 1 Pa. (10 refs.) *N.F.S.*

108606 Charge imbalance due to thermoelectric effects in superconductors: A two fluid description. B.A.Mattoo, Y.Singh (Dept. of Phys., Univ. of Kashmir, Srinagar, India).
Pramana (India), vol.20, no.5, p.392-403 (May 1983).
Using a generalised two-fluid picture for the charge of a superconductor, the generation of charge imbalance by a temperature gradient under different conditions is studied. The voltage developed by a temperature gradient in the presence of supercurrent is estimated. The results agree with experiment. The results obtained for the generation of charge imbalance in the absence of imposed current agree with those obtained using other techniques. (18 refs.)

74.30G Response to electromagnetic fields, nuclear magnetic resonance, ultrasonic attenuation

108607 Superconducting contours for compensating inhomogeneities and instabilities of magnetic fields. V.I.Kurochkin, V.V.Sukhoi.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.5, p.59-62 (1983). In Ukrainian.
A technique is described for compensation of the magnetic field inhomogeneity and instability. Compensation is performed by closed superconducting loops of definite geometry. Equations for determining loop winding geometry are formulated and solved. (7 refs.)

Coexistence of antiferromagnetism and superconductivity in CrRe alloys ....See Entry 108591

74.40 FLUCTUATIONS AND CRITICAL EFFECTS

108608 Upward curvature of the temperature dependence of upper critical magnetic field perpendicular to superconducting aluminum films. B.Shinozaki, T.Kawaguti, Y.Fujimori (Coll. of General Education, Kyushu Univ., Fukuoka, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2297-300 (July 1983).
The temperature dependence of the electrical resistance of thin granular aluminum films shows the maximum far above the superconducting transition temperature due to both effects of thermodynamic fluctuations and electron localization, for the film with large normal-state sheet resistance R^N. The temperature dependence of the upper critical field of the film with $R^N\simeq 10^3$ $(\Omega/\square)$ shows an upward curvature. The results on the upper critical field are explained by a current theory of dirty superconductors including electron localization and electron-electron interactions.

Phase transitions in compounds of rare-earth metals ....See Entry 108594

74.50 PROXIMITY EFFECTS, TUNNELLING PHENOMENA, AND JOSEPHSON EFFECT

108609 Al-coated variable thickness Pb microbridge. M.Kobayashi, T.Musha (Dept. of Appl. Electronics, Tokyo Inst. of Technol. Nagatsuta, Yokohama, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.6, p.L361-3 (June 1983).
To make a thin-film Pb microbridge durable against heat cycles, the authors coated thin Al film over a variable thickness Pb microbridge. It showed no detectable change in its electrical properties, critical current or normal resistance after 20 heat cycles and preservation for 250 hours in a humid environment. (3 refs.)

108610 Bistability in a DC voltage biased Josephson junction. R.Bonifacio, P.Morra (Istituto di Sci. Fisiche, Univ. di Milano, Milano, Italy).
Nuovo Cimento D (Italy), vol.2D, ser.1, no.4, p.1089-96 (July-Aug. 1983).
Using a well-known theoretical model for a Josephson junction coupled to its own radiation field and to a DC potential, the authors demonstrate that the potential across the junction, the frequency and the intensity of the radiated field may show a discontinuous behaviour with a first-order-like phase transition hysteresis cycle as a function of the applied potential. (7 refs.)

108611 Multilayer thermally cyclable film [PbInAu]. E.I.Alessandri, J.H.Magerlein, M.Murakami (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.26, no.2, p.493-4 (July 1983).
Films prepared by depositing ten layers in a sequence lead-gold-indium...gold-indium-lead have smooth surfaces and resist the destructive effects of repeated thermal cycling between room temperature and liquid helium temperature. This film has application to Josephson junction devices as a counter electrode. (no refs.)

108612 Repulsive interaction between unipolar fluxons with Ohmic loss and bias current in infinitely long Josephson junction. K.Watanabe, C.Ishii (Dept. of Phys., Sci. Univ. of Tokyo, Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2304-7 (July 1983).
The effect of perturbations (constant bias current and Ohmic resistivity) on the motion of two fluxons with identical polarity is investigated by calculating the time evolution of soliton parameters which appear in the two-fluxon solution of the unperturbed sine-Gordon equation. It is demonstrated that a repulsive force significantly affects the short time behavior of the soliton parameters, and gives rise to a characteristic overshoot structure in this time region. It is also shown that the long time behavior of soliton parameters is dominated by the external perturbations and the relative velocity of the two fluxon peaks tends to zero in this limit. (14 refs.)

108613 Magnetic field behavior of a Josephson-junction array: two-dimensional flux transport on a periodic substrate. R.A.Webb, R.F.Voss, G.Grinstein, P.M.Horn (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Phys. Rev. Lett. (USA), vol.51, no.8, p.690-3 (22 Aug. 1983).
This Letter reports measurements down to 3 mK of the magnetic field dependence of the resistance and critical current of a weakly coupled periodic array of Josephson junctions. Below 700 mK the resistance is an oscillatory function of field. The temperature dependence of the resistance for integral numbers of flux quanta per cell suggests the existence of a Kosterlitz-Thouless transition involving the unbinding of defects in the flux lattice. (17 refs.)

108614 Fluxon propagation on a Josephson transmission line. A.Matsuda, T.Kawakami (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Tokyo, Japan).
Phys. Rev. Lett. (USA), vol.51, no.8, p.694-7 (22 Aug. 1983).
Fluxon propagation profiles for Josephson transmission lines have been directly measured. Single-input-pulse dissociation into multifluxon as well as velocity-dependent wave forms have actually been observed. The experimental results agree well with the theoretical results if a large RF loss term is assumed. (11 refs.)

108615 On the conditional transition probabilities of the magnetic flux at low temperatures in a superconducting loop closed with a low-capacitance superconducting point contact. D.W.Bol, R.van Weelderen, R.de Bruyn Ouboter (Kamerlingh Onnes Lab., Rijksuniv. Leiden, Leiden, Netherlands).
Physica B & C (Netherlands), vol.122B+C, no.1, p.1-7 (Sept. 1983).
The conditional transition probabilities of the magnetic flux in a superconducting ring containing a weak link have been determined experimentally. The authors investigated the behaviour of the embraced magnetic flux as a function of the external magnetic field and time in situations in which the system could jump from a metastable flux state into another flux state and vice versa by classical thermal fluctuations over, or by quantum mechanical tunnelling through a potential barrier separating both flux states, depending on the temperature. For these low capacitance point contacts it was shown that stochastic, macroscopic quantum tunnelling could become dominant at lower temperatures. In order to investigate macroscopic quantum tunnelling in more detail they measured the conditional transition probabilities as a function of time for the devices and found an exponential phase incoherent behaviour, indicating that the phase relationship between the amplitudes for being on the different sides of the barrier can be neglected.

108616 Tunneling spectroscopic study on the superconductivity of $(TMTSF)_2ClO_4$ crystals. Y.Maruyama, R.Hirose, G.Saito, H.Inokuchi (Dept. of Chem., Ochanomizu Univ., Tokyo, Japan).
Solid State Commun. (USA), vol.47, no.4, p.273-4 (July 1983).
The authors observed the energy gap spectra for $(TMTSF)_2ClO_4$-Al_2O_3-Au junctions at 1.5K by measuring their tunneling current characteristics. The superconducting gap was estimated to be less than 2 meV ($T_c<6$K) which is much smaller than the previously reported value, 8 meV. (4 refs.)

108617 Paraconductivity of V_3Ge in magnetic field. V.A.Marchenko, A.V.Nikulov.
Fiz. Nizk. Temp. (USSR), vol.9, no.8, p.816-22 (Aug. 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
An excess electrical conductivity as a function of magnetic field and temperature in V_3Ge has been investigated in the vicinity of and above the upper critical field. The measurements above are compared with the Ami-Maki theory (1978) and that derived in the Hartree approximation. The sharp deviation of the experimental dependence from the theoretical one in high magnetic fields is considered to be due to the transition from a one-dimension state to a mixed one. (13 refs.)

Fiz. Nizk. Temp. (USSR), vol.9, no.8, p.804-15 (Aug. 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
The critical currents in a single crystal of Nb-5.5% Mo alloy deformed at the temperature 77K were investigated. A critical current peak near the critical field was observed on the curves $J_c(H)$. The value of the magnetic field at a maximum current and the value of the maximum critical current varied under varying of the angle between the vortex and directions of screw dislocation clusters ⟨111⟩. Experimental results were compared with the microscopic theory of the peak effect proposed by Larkin and Ovchinnikov (1979). (19 refs.)

108620 Critical current studies of Zr-based metallic glasses. M.Tenhover (Standard Oil Co., Dept. of Res., Warrensville Heights, OH, USA), B.M.Clemens.
J. Phys. D (GB), vol.16, no.9, p.1761-5 (14 Sept. 1983).
Critical current and flux pinning measurements of a variety of Zr-based metallic glasses are reported. The measurements were performed as a function of temperature and applied magnetic field on as-quenched samples. A universal behaviour of the critical current density of flux pinning force density is observed for glasses of the form $Zr_{70}X_{30}$(X=Cu, Ni, Co and $Ni_{0.5}Fe_{0.5}$). This result is attributed to pinning due to quenched-in stress fields and edge pinning. (15 refs.)

75.10D Crystal-field theory and spin Hamiltonians

108622 Method of the spin Hamiltonian diagonalization. V.L.Safonov (Kurchatov Inst. of Atomic Energy, Moscow, USSR).
Phys. Lett. A (Netherlands), vol.97A, no.4, p.164-7 (22 Aug. 1983).
A nonlinear unitary transformation is proposed which permits one to remove nondiagonal terms in the spin Hamiltonian. The diagonalization procedure is based on solution of linear differential equations with bonds. This method allows one to simplify the theoretical description of spin systems both in magneto-ordered and in paramagnetic states. It may be also employed for Bose and Fermi operators. (6 refs.)

108623 Integrable reductions of many component magnetic systems in (1,1) dimensions. V.G.Makhankov, O.K.Pashaev (Joint Inst. for Nuclear Res., LCTA, Dubna, USSR), A.Kundu.
Phys. Scr. (Sweden), vol.28, no.2, p.229-34 (Aug. 1983).
A generalized many component Heisenberg spin chain with phonon interaction is proposed. Some reductions of the proposed model leading to different real magnetic systems such as many chained magnetic crystals with nontrivial interchain couplings, a mixture of many chained ferro and antiferromagnets, a 'colour' generalized Pierels-Hubbard model, etc. are studied. It has been shown that the dynamics of all the above real models are close to some integrable systems and coincide with them in certain limits. Such integrable systems are the coupled generalised system of Yajima and Oikawa and $U(p,q)$ nonlinear Schrodinger equation, already well studied. (17 refs.)

75.10H Ising and other classical spin models

108624 Susceptibility of a quasi-one-dimensional magnet with the Ising interaction. M.A.Yurishchev.
Fiz. Nizk. Temp. (USSR), vol.9, no.8, p.851-7 (Aug. 1983). In Russian. English translation in: *Sov. J. Low Temp. Phys. (USA)*
A three-dimensional Ising model with the strong spatial anisotropy of the interaction is approximated by the ensemble of independent four-chain clusters for which an analytical formula of the parallel susceptibility has been derived. Along with the known expression for the perpendicular susceptibility of the linear Ising chain, the derived formula is used to describe the powder susceptibility of $CoCl_2.2NC_5H_5$. (11 refs.)

108625 A special-purpose processor for the Monte Carlo simulation of Ising spin systems. A.Hoogland, J.Spaa, B.Selman, A.Compagner (Lab. of Appl. Phys., Univ. of Technol., Delft, Netherlands).
J. Comput. Phys. (USA), vol.51, no.2, p.250-60 (Aug. 1983).
A description is given of a special-purpose computer for the study of static and dynamic properties of stochastic Ising-like systems of up to 4×10^6 spins. Elementary Monte Carlo steps are executed in the machine at a rate of 1.5 MHz. The first results are given, obtained as part of a testing procedure of the machine. (14 refs.)

108626 The gap exponent Δ for the spin-*s* Ising model on the FCC lattice. S.McKenzie (Dept. of Phys., King's Coll. London, London, England).
J. Phys. A (GB), vol.16, no.13, p.3133-8 (11 Sept. 1983).
High-temperature series expansions are presented for the magnetisation $M(K,h)$ of the spin-s Ising model on the face-centred cubic lattice. Series coefficients are derived to order 13 and 5 respectively in the variables $K=J/kT$ and $h=mH/kT$, for ${}^1/_2\leq s\leq{}^9/_2$. The data are analysed for $2\Delta-\gamma$, where Δ and γ denote the gap exponent and the susceptibility exponent respectively. The estimate $2\Delta-\gamma=1.890\pm0.003$ satisfies the data for all s. (13 refs.)

108627 Decorated Ising model with classical vector spins. T.Horiguchi (Dept. of Engng. Sci., Tohoku Univ., Sendai, Japan), L.L.Goncalves.
Physica A (Netherlands), vol.120A, no.1-2, p.600-8 (1983).
A decorated Ising model with classical vector spins on a square lattice is investigated in detail. The partition function is reduced to the one of the Ising model with effective exchange integrals. Three successive phase-transition

temperatures are obtained and four states, namely paramagnetic, antiferromagnetic, again paramagnetic and ferromagnetic states are realized as the temperature is decreased. For systems on other two- and three-dimensional loose-packed lattices, the situation is the same as the system on the square lattice. (15 refs.)

108628 The diluted spin 1/2 Ising model in the honeycomb lattice. P.R.Silva, F.C.Sabarreto (Dept. de Fisica, Univ. Federal de Minas Gerais, Belo Horizonte, Brazil).
Phys. Status Solidi b (Germany), vol.118, no.2, p.K93-7 (1 Aug. 1983).
In the case of the spin 1/2 diluted Ising model in the honeycomb lattice (the quenched diluted bond problem), the authors devised the possibility of combining the differential operator method applied to Callen's (1963) exact relation, jointly with the exact result for the spontaneous magnetization, in order to get the diluted spontaneous magnetization expression and the critical frontier which separates the ferromagnetic and the paramagnetic phases. (15 refs.)

108629 Spin-Peierls state vs. Neel state. I. Small Ising anisotropy. S.Inagaki, H.Fukuyama (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.7, p.2504-13 (July 1983).
The ground state of the one-dimensional antiferromagnetic Heisenberg-Ising model coupled with the lattice distortion is determined based on the phase Hamiltonian defined by the boson representation of the spinless fermions. This phase Hamiltonian can describe properly the possible feature of the resonating valence bond proposed by Anderson. All the possible states, including the spin-Peierls state, the Neel state, and states with both lattice distortions and magnetic orderings, are examined within the self-consistent harmonic approximation by use of the treatment of Nakano and Fukuyama (1980, 1981) which extends the theory of spin-Peierls state of Cross and Fisher (1979). The phase boundary for small Ising anisotropy is determined which separates the spin-Peierls state and the Neel state, and it is found that the former state is stable in a wide region of parameters. (39 refs.)

108630 Competing interactions in Heisenberg quantum spin systems: ground-state calculations for finite clusters. J.Richter (Wissenschaftsbereich Phys., Hochschule fur Verkehrswesen Dresden, Dresden, Germany).
J. Phys. C (GB), vol.16, no.25, p.L913-18 (10 Sept. 1983).
Ground-state properties of spin $^1/_2$ Heisenberg systems are calculated for finite clusters up to nine spins. By a comparison of systems with different degrees of competition in the interactions, the frustration effects in the spin configuration of the ground state are investigated. A minimum value for the strength of the spin correlation $|<S_i.S_j>_0|$ of antiferromagnetically interacting spins i and j in systems without competition is estimated to be 0.25. The occurrence of values for $|<S_i.S_j<_0|$ lower than this minimum value indicates frustration. By varying the degreee of competition, abrupt changes in the ground state are found. Furthermore the competition for certain systems causes ground states with much lower symmetry than that of the Hamiltonian. (25 refs.)

108631 Perturbation of solitons in the classical continuum isotropic Heisenberg spin system. M.Daniel, M.Lakshmanan (Dept. of Phys., Bharathidasan Univ., Tamilnadu, India).
Physica A (Netherlands), vol.120A, no.1-2, p.125-52 (1983).
The dynamics of a one-dimensional classical continuum isotropic Heisenberg ferromagnetic spin system in the presence of a weak relativistic interaction, which causes damping of the spin motion, is considered. The corresponding evolution equation is identified with a damped nonlinear Schrodinger equation in terms of the energy and current densities of the unperturbed system. A direct perturbation method, along the lines of Kodama and Ablowitz, is developed for the envelope soliton solution of the nonlinear Schrodinger equation and the explicit perturbed solution obtained. This solution is found to be valid in a finite domain of the propagation space. To cover the entire region, a uniform solution is constructed using the matched asymptotic expansion technique. Finally, the spin vectors are constructed using the known procedures in differential geometry and the consequences of damping analysed briefly. (34 refs.)

Dipolar interactions in the critical dynamics of Heisenberg ferromagnets ....See Entry 108722

75.10L Band and itinerant models

108632 Theory of two-band ferromagnetism. I.T.Akhiezer (Sci. Res. Inst. of Radiophys. & Electronics, Acad. of Sci., Kharkov, Ukranian SSR).
Fiz. Met. & Metalloved. (USSR), vol.56, no.1, p.9-13 (July 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
Ferromagnetic metals are considered in a two-band model with a self-consistent field on the assumption that the conduction band is broad and the band of the inner d- or f-electrons is inifinitesimally narrow. A study is made of a nonexcited state and of the static magnetic susceptibility throughout the full range of temperatures between absolute zero and the Curie point T_c. A criterion for the appearance of ferromagnetism in this model is derived. Certain relationships are established between the observable quantities (Curie point, magnetization at $T=0$, and magnetic susceptibility). (10 refs.) *A.T.*

108633 Three body problem in transition metals—application to nickel. J.Igarashi (Dept. of Phys., Osaka Univ., Toyonaka, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2827-37 (Aug. 1983).
A many-body theory which takes account of the two-hole and one-electron multiple scattering is developed. By applying it to a simple model simulating nickel, the result of the recent angle resolved photoemission experiment is discussed. A reduction of both the exchange splitting and the d band width is obtained. The satellite position shifts toward the Fermi level from that given by the two-hole *t*-matrix theory. (19 refs.)

108634 A spin fluctuation theory of degenerate narrow bands—finite-temperature magnetism of iron. H.Hasegawa (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).
J. Phys. F (GB), vol.13, no.9, p.1915-29 (Sept. 1983).
A previously developed theory of itinerant-electron magnetism at finite temperatures is generalised to include the effect of degenerate multi-bands with t_{2g} and e_g symmetry by adopting the static functional integral method and the coherent potential approximation (CPA). Numerical calculations of the Curie temperature, the magnetisation curve, the amplitude of local moments and the susceptibility are made for iron by using the detailed density of states generated by the recursion method for the tight-binding model. Calculated results are shown to account for finite-temperature properties of iron. In particular, the calculation explains the observed very weak temperature dependence in the spin-density asphericity, which cannot be explained by the Stoner theory. The authors' results are compared with those obtained by alternative approaches in which the five sub-bands are taken to be equivalent. (69 refs.)

108635 Magnetism of linear chains. M.Weinert, A.J.Freeman (Phys. Dept., Northwestern Univ., Evanston, IL, USA).
J. Magn. & Magn. Mater. (Netherlands), vol.38, no.1, p.23-33 (Aug. 1983).
Accurate self-consistent local spin density electronic structure calculations for linear chains of Ni and Fe atoms are presented which realistically treat their three-dimensional nature. The one-dimensional character of the bands manifests itself in high density of states arising from van Hove singularities. Both transition metals are 'strong' Stoner ferromagnets with large magnetic moments (3.3 and 1.1 μ_B for Fe and Ni, respectively) and have large s- and d-exchange splittings. From fits of results to simple tight-binding models, the authors find that the d-d effective exchange interactions is similar to that in bulk. However, the use of standard bulk tight-binding parameters is found to be inappropriate since they qualitatively change the results by, for example, misplacing the Fermi level with respect to the band edges. Moreover, in contrast to the bulk, the linear chains also show a rather large *s*-exchange interaction and hence a large and positive valence contribution to the contact hyperfine field; for Fe this results in a positive contact hyperfine field of the same magnitude as in the bulk. The unique signatures of these linear systems should make their characterization experimentally feasible. (21 refs.)

75.20E Metals and alloys

108636 Effect of electron correlation on the magnetic properties of expanded liquid sodium. L.Bottyan, R.Dupree (Phys. Dept., Univ. of Warwick, Warwick, England), W.Freyland.
J. Phys. F (GB), vol.13, no.9, p.L173-8 (Sept. 1983).
The magnetic susceptibility, NMR Knight shift and spin-lattice relaxation time of sodium have been measured up to 1000°C. Strong deviations from simple interacting electron-gas behaviour are found above 400°C. The paramagnetism is still further enhanced and the NMR data show that changes in the wavevector dependence of the susceptibility consistent with fluctuations towards a spin density wave occur. Such behaviour is expected for an itinerant antiferromagnet above its ordering temperature as predicted by some recent theories of the metal-nonmetal transition in an expanded fluid metal. (16 refs.)

108637 Induced neutron magnetic form factor of $LaSn_3$. J.Zarestky, C.Stassis, B.N.Harmon, J.A.Begum (Dept. of Phys., Iowa State Univ., Ames, IA, USA), R.M.Moon, S.H.Liu, D.D.Koelling.
J. Magn. & Magn. Mater. (Netherlands), vol.38, no.1, p.61-6 (Aug. 1983).
Polarized neutron scattering techniques have been used to study the spatial distribution of the magnetization induced in a single crystal of $LaSn_3$ by a magnetic field of 42.5 kG at 100K. The authors find that the magnetic form factor decreases very rapidly with increasing scattering angle, and bears no resemblance to the spin or orbital free-atom magnetic form factor. The experimental results are in reasonable agreement with band theoretical calculations of the spin magnetic form factor of $LaSn_3$. They conclude that (a) the spin part is the dominant contribution to the bulk susceptibility of $LaSn_3$ and (b) there is a substantial amount of Sn-5p electronic character in the wavefunctions near the Fermi level. (26 refs.)

108638 A study of the paramagnetic form factor of rhodium metal by polarized neutron diffraction. P.Radhakrishna (Lab. Leon Brillouin, CENS, Gif-sur-Yvette, France), P.J.Brown.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.216-18 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The magnetic form factor of the induced moment in paramagnetic rhodium metal has been measured at 100K in an external field of 4.6 T. The data for the five innermost reflections have been corrected for the diamagnetism of the electrons and the Schwinger effect. The results are discussed in terms of recent calculations. (5 refs.)

108639 Magnetic spectral response in the intermetallic compound $CeSn_3$. A.P.Murani (Inst. Laue-Langevin, Grenoble, France).
Phys. Rev. B (USA), vol.28, no.4, p.2308-11 (15 Aug. 1983).
Neutron-inelastic-scattering measurements on $CeSn_3$ performed with high-incident-energy neutrons reveal a broad inelastic hump centered around 40 meV at low temperatures, in addition to the usual quasielastic spectrum centered on zero energy. With increasing temperature, the inelastic hump broadens and 'melts away', such that around the temperature of the maximum in the susceptibility (~130K) no observable trace of its presence remains and the full magnetic response can be described by a single quasielastic spectrum. (23 refs.)

108640 Magnetic and crystallographic characteristics of $RNiGa_4$ compounds (R-rare earth metal). V.A.Romaka, Yu.N.Grin', Ya.P.Yarmolyuk.
Ukr. Fiz. Zh. (USSR), vol.28, no.7, p.1095-7 (July 1983). In Russian.
The Faraday method in the temperature interval 78 to 300K, was used to investigate the temperature dependence of the magnetic susceptibility χ of $RNiGa_4$ compounds (R=Y,Nd,Sm,Gd,Tb,Dy,Ho,Er,Tm,Yb,Lu). The values of χ for $YNiGa_4$, $YbNiGa_4$ and $LuNiGa_4$ are quite small and do not change with temperature (Pauli paramagnetism). The $\chi(T)$ dependence for the rest of the compounds obey the Curie-Weiss law except $SmNiGa_4$. The effective magnetic moments are close to the values for R^{3+}. (9 refs.) *V.G.P.*

75.25 SPIN ARRANGEMENTS IN MAGNETICALLY ORDERED MATERIALS (NEUTRON STUDIES, ETC)

108641 The magnetic structure of $HoCo_2Si_2$. P.Schobinger-Papamantellos (Inst. fur Kristallographie und Petrographie, ETH Zurich, Zurich, Switzerland), C.Routsi, J.K.Yakinthos.
J. Phys. & Chem. Solids (GB), vol.44, no.9, p.875-7 (1983).
The authors have carried out neutron diffraction on a $HoCo_2Si_2$ powder sample at 4.2K. The magnetic structure of this compound is collinear antiferromagnetic with the holmium magnetic moments parallel to the *c*-axis of the crystal. The magnetic moment value of holmium is 9.85 μ_B. The magnetic space group is $I4/mm'm'$ $(Sh_{128}{}^{410})$ $k=000$. The ordering temperature is $T_N=12(1)K$. (9 refs.)

108642 Antiferromagnetic antimonides $MnSb_2O_4$ and $NiSb_2O_4$. J.R.Gavarri (Ecole Centrale des Arts et Manufactures, Univ. Paris, Villetaneuse, France), A.W.Hewat.
J. Solid State Chem. (USA), vol.49, no.1, p.14-19 (Aug. 1983). In French.
Neutron diffraction has been used to study the variation of antiferromagnetic order in the antimony isomorphous $MnSb_2O_4$ (T_N~60K) and $NiSb_2O_4$ (T_N~46K). The magnetic moments have been related to the Mn^{2+} and Ni^{2+} spins and magnetostrictive effects have been interpreted. The influence of the method of synthesis is mentioned: polycrystalline $MnSb_2O_4$ has been obtained from hydrothermal synthesis. Orthorhombic distortions are not connected with magnetic interactions but with structural defects. (12 refs.)

108643 Crystal and magnetic structure of the $CoMn_{1-x}Ti_xSi$ system. A.Szytula (Inst. of Phys., Jagiellonian Univ., Cracow, Poland), W.Bazela, S.Radenkovic.
J. Magn. & Magn. Mater. (Netherlands), vol.38, no.1, p.99-104 (Aug. 1983).
The magnetic and crystallographic nature of the compounds $CoMn_{1-x}Ti_xSi$ $(0\leq x\leq 0.5)$ is studied by X-ray, neutron diffraction and magnetometric measurements. It is shown that the solid solutions arise for $0\leq x\leq 0.05$, with the crystal structure of the NiTiSi type. All compounds are antiferromagnets. The magnetic moment localized on Mn and Co atoms forms a double spiral in both sites. The dilution of the Mn sublattice by Ti atoms change only slightly the magnetic properties—Neel temperature and parameters of magnetic structure. (12 refs.)

108644 Magnetic structures of monoclinic FeGe. D.Fruchart, B.Malaman, G.Le Caer, B.Roques (Lab. de Cristallographie, CNRS, Univ. Sci. et Medicale de Grenoble, Grenoble, France).
Phys. Status Solidi a (Germany), vol.78, no.2, p.555-69 (16 Aug. 1983). In French.
The magnetic structure of monoclinic FeGe is determined by neutron diffraction. Between $T_N=342K$ and $T_c=115K$, the magnetic structure is characterized by nearly ferromagnetic planes, antiferromagnetically coupled, while the magnetic moments of iron atoms located between these planes are not ordered. They order magnetically at T_c. For $T<T_c$, the iron moments form a coned structure with a periodicity of ≈395 Å. Mossbauer spectroscopy results are consistent with those of neutron diffraction. (22 refs.)

108645 Magnetic ordering in the layered compound $(CD_3ND_3)_2CuCl_4$. J.J.M.Steijger, E.Frikkee (Netherlands Energy Res. Found. ECN, Petten, Netherlands), L.J.de Jongh, W.J.Huiskamp.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.202-5 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The magnetic ordering in the pseudo two-dimensional ($d=2$) Heisenberg ferromagnet $(CD_3ND_3)_2CuCl_4$ is investigated by means of neutron diffraction. Long-range three-dimensional ($d=3$) order sets in at $T_c=8.84(2)K$. Comparison of the temperature dependence of the magnetization $M(T)$ with the prediction on the basis of renormalized spin-wave theory for a pseudo $d=2$ Heisenberg ferromagnet yields the interaction parameters $J/k_B=19.3(5)K$ and $J'/J\approx 10^{-3}$-10^{-5}. The critical behaviour of $M(T)$ may be described by a power law with exponent $\beta=0.242({}_{-25}{}^{+15})$. The variation of the $d=2$ ordering with temperature is deduced from scans perpendicular to the line $[00\zeta]$. Even at $T=1.68K$ only ≈5-10% of the expected magnetic scattering is actually observed in the (002) reflection, while the ridge intensity at $\zeta=3.58$ remains constant below $T\approx 7K$ at an unusually high level. The incomplete $d=3$ order for $T\ll T_c$ is ascribed to structural disorder in the positions of the Cu^{2+} ions. (17 refs.)

108646 Competing magnetic orderings in random mixtures: $Fe_xNi_{1-x}Cl_2$. A.Ito, T.Tamaki, Y.Someya, H.Ikeda (Faculty of Sci., Ochanomizu Univ., Tokyo, Japan).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.207-11 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Neutron scattering and Mossbauer absorption techniques are applied to the mixture $Fe_xNi_{1-x}Cl_2$ in which the strong Ising-type anisotropy of Fe and the weak XY-type anisotropy of Ni compete with each other. A mixed ordering phase is found to exist in a narrow range of concentration around x~0.08. It is found that if a small amount of Fe, ~2%, replaces Ni in $NiCl_2$, the directions of majority spins of Ni rise up from the *c*-plane (the spin easy axis of $NiCl_2$) as a whole. Diffuse scattering of neutrons is observed in the $S_{\parallel}$-ordered antiferromagnetic (AF) phase over a wide range of temperature for the samples with concentrations near the crossing point. It might be one of the distinctive properties of the ordered phase in the mixture with competing spin anisotropies. (5 refs.)

108647 Antiferromagnetism of YMn_2 intermetallic compound. Y.Nakamura, M.Shiga (Dept. of Metal Sci. & Technol., Kyoto Univ., Kyoto, Japan), S.Kawano.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.212-15 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The authors have made neutron diffraction measurements on powdered YMn_2 and determined its spin structure to be a collinear antiferromagnet with a Mn moment of $2.7\mu_B$. By analyzing both the intensity of magnetic peaks and the NMR spin-echo spectrum at 4.2K, the direction of the spin axis was found to be parallel to the [111] direction. The Neel temperature T_N of YMn_2 has been determined to be about 100K by means of magnetic susceptibility and thermal expansion measurements. These measurements reveal that the magnetic transition is of first order and shows a thermal hysteresis around T_N. (5 refs.)

108648 A new probe for surface magnetism: polarized neutron reflection. S.D.Bader, G.P.Felcher, K.E.Gray, R.T.Kampwirth (Argonne Nat. Lab., Argonne, IL, USA).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.219 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
A beam of polarized neutrons of wavelength λ is reflected by a magnetized surface with an intensity $R^{\pm}(\lambda)$, where R is related by optical laws to the refractive index $n^{\pm}=n_N\pm n_M$ of the material. While the nuclear refractive index n_N is constant for a homogeneous body, n_M is proportional to the magnetic induction $\mathbf{B}(z)$, where z is the distance from the surface. A perturbation of $\mathbf{B}$ close to the surface may alter the reflectivity $R^{\pm}(\lambda)$ sufficiently to allow for its detection. Numerical calculations appropriate to niobium show that neutron reflection can determine the penetration length within 10%. For elemental ferromagnets the magnetism at the surface is increasingly perturbed as the temperature approaches the Curie point; in nickel the perturbation should become detectable at 0.85 T_c. (no refs.)

108649 Magnetic structure of hcp Ho-Ce and Er-Ce alloys. S.Kawano, N.Achiwa (Res. Reactor Inst., Kyoto Univ., Osaka, Japan).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.220-3 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The authors have established the magnetic phase diagram of both hcp Ho-Ce and Er-Ce alloys by means of neutron diffraction. The alloys with 84% Ho or more exhibit a helix→cone transition, which is similar to the case of pure Ho. The 80% Ho alloy shows only a helical structure. The Er-Ce alloys with 95% and 90% Er exhibit a longitudinal sinusoidal oscillation→*c*-axis ferromagnet→cone transition and the 80% Er alloy shows only the *c*-axis ferromagnet which does not occur in pure Er. The tendency of stabilizing the ferromagnetic phase exists in hcp Ho-Ce and Er-Ce alloys. Neel temperatures and initial turn angles are lowered with the deGennes factor. The RKKY interaction in hcp Ho-Ce and Er-Ce alloys is strongly affected to have a smaller range by alloying with light rare earth Ce. (10 refs.)

108650 Magnetic properties of oxides containing six-coordinated iron (IV) or (V). J.L.Soubeyroux (Inst. Laue Langevin, Grenoble, France), B.Buffat, N.Chevreau, G.Demazeau.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.227-31 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Few oxides containing six-coordinated iron (IV) or (V) are known. Recently, the phases $Sr_{0.5}La_{1.5}Li_{0.5}Fe_{0.5}O_4$ and La_2LiFeO_6 have been prepared; X-ray and neutron diffraction studies of these oxides can be interpreted as the result of an ordering of the lithium and iron atoms. Magnetic susceptibility, Mossbauer resonance and neutron diffraction measurements have also been performed on these two phases. They lead to an antiferromagnetic ordering of the moments at 31K and 14.5K for iron (IV) and (V) respectively. For $Sr_{0.5}La_{1.5}Li_{0.5}Fe_{0.5}O_4$, magnetic lines of the neutron diffractograms at low temperature involve a helimagnetic propagation vector $Q=0.49(2\pi/a)$ $[110]\text{Å}^{-1}$. For La_2LiFeO_6 a helimagnetic structure has also been found. All these properties are compared to those of the perovskite $SrFe^{IV}O_3$. (14 refs.)

108651 Neutron scattering on solitons in quasi-one-dimensional systems. V.K.Fedyanin (Joint Inst. for Nuclear Res., Dubna, USSR).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.255 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
In the framework of the model of an ideal lattice gas of solitons, the author obtains a general formula for the dynamic neutron scattering form factor. (3 refs.)

75.30 MAGNETICALLY ORDERED MATERIALS, OTHER INTRINSIC PROPERTIES

(for critical point effects, see 75.40)

108652 Chelate polymer showing ferro- or ferrimagnetism at room temperature. M.Kinoshita, T.Sugano.
Solid State Phys. (Japan), vol.18, no.5, p.267-70 (May 1983). In Japanese.
The iron-bonded chelate polymer of $[\{Fe(C_{13}H_{17}N_3)_2\}SO_4.6H_2O]_n$ is introduced as the first example of magnetic polymers which have a backborn frame of organic polymer and exhibit ferro- or ferrimagnetism even at room temperature. (8 refs.)

75.30C Saturation moments and magnetic susceptibility

108653 Magnetic susceptibility of dysprosium alloys with germanium over a broad temperature range. G.I.Batalin, S.I.Tyukhtenko, D.A.Stakhov, V.G.Batalin, N.V.Zhukovskaya (T.G. Shevchenko Kiev State Univ., Kiev, Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.8, p.1183-5 (Aug. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.8, p.1391-3 (Aug. 1982).
The magnetic susceptibility of alloys of the Dy-Ge system were studied over a broad concentration range at 300-1800K. The samples were obtained in an electric-arc furnace on a water-cooled copper Bearth in an argon medium. The temperature dependence of the specific magnetic susceptibility χ_g of the alloys was measured according to the Faraday-Sucksmith method. The maximum error in the determination of χ_g did not exceed 3%. The values of χ_g were used to determine the atomic magnetic susceptibilities χ_A. (7 refs.)

108654 Magnetic susceptibilites of the frustrated triangular lattice antiferromagnets $CsVCl_3$ and VX_2 (X=Cl, Br and I): appearance of magnetic liquid in the ordered state. K.Hirakawa (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan), H.Ikeda, H.Kadowaki, K.Ubukoshi.
J. Phys. Soc. Jpn. (Japan), vol.52, no.8, p.2882-7 (Aug. 1983).
Magnetic susceptibilities χ of the frustrated triangular lattice antiferromagnets $CsVCl_3$ and VX_2 (X=Cl, Br and I) have been measured by means of the conventional Faraday-type as well as the SQUID magnetometers. The χ-T curve of $CsVCL_3$ shows a typical 1D-like character in agreement with the early work by Niel et al. (1979). At $T<T_N$, χ_c increases rapidly with decreasing T, whereas χ_a stays at a constant value. The χ-T curve in VX_2 which are though to be 2D-like systems is very flat and shows an anomaly at T_N. Surprisingly, however, no anisotropy could be detected below T_N. This suggests that the transition is quite different from the conventional one for the non-frustrated antiferromagnetic systems and a magnetic liquid state is formed in the ordered state. (8 refs.)

108655 Field dependence of the d.c. magnetic susceptibility in $Fe_xMg_{1-x}Cl_2$. J.Gelard, F.Bensamka, D.Bertrand, A.R.Fert, J.P.Redoules, S.Legrand (Dept. de Phys., INSA, Toulouse, France).
J. Phys. C (GB), vol.16, no.26, p.L939-43 (20 Sept. 1983).
The authors have studied the temperature dependence of the susceptibility of insulating $Fe_xMg_{1-x}Cl_2$ in various uniform magnetic fields up to 8000 Oe. For $x=0.286$ spin glass behaviour is observed and the reversibility temperature moves down with field. For $x=0.552$ results give evidence for two transitions: paramagnetic-antiferromagnetic phase and antiferromagnetic-spin glass phases; the uniform magnetic field enlarges the domain of existence of the spin glass phase ($H<5000$ Oe), giving an experimental illustration of random field effects. (8 refs.)

108656 Magnetic susceptibility and the spin-glass transition of $Cd_{1-x}Mn_xS$ and $Zn_{1-x}Mn_xS$ at low temperatures. Y.Q.Yang, P.H.Keesom, J.K.Furdyna (Dept. of Phys., Purdue Univ., West Lafayette, IN, USA), W.Giriat.
J. Solid State Chem. (USA), vol.49, no.1, p.20-4 (Aug. 1983).
The low-field magnetic susceptibility of the diluted magnetic semiconductors $Cd_{1-x}Mn_xS$ and $Zn_{1-}s_xMn_xS$ was measured betwen 4.2 and 30K for the Mn concentration range $0.25<x<0.40$. When $x>0.25$, both of these ternary systems shows a spin-glass transition in the above temperature range, as evidenced by a somewhat rounded cusp in the susceptibility and by the presence of irreversible effects. Because these materials are insulators at low temperatures, and the interactions between the Mn ions are only antiferromagnetic, the observed spin-glass behavior if attributed to frustration inherent in the HCP lattices of these compounds. The phase diagrams for the boundary of the paramagnetic and the spin-glass phases are presented for the two alloy systems, and the difference between the two phase diagrams is discussed. (16 refs.)

108657 Preparation, structure, and magnetic properties of isostructural La_3MAlS_7 and La_3MFeS_7 (M=Mg, Mn, Fe, Co, Ni, or Zn). K.S.Nanjundaswamy, J.Gopalakrishnan (Solid State & Structural Chem. Unit, Indian Inst. of Sci., Bangalore, India).
J. Solid State Chem. (USA), vol.49, no.1, p.51-8 (Aug. 1983).
A series of quaternary metal sulfides of the general formula $La_3MM'S_7$ (M=Mn, Fe, Co; M'=Al and M=Mg, Mn, Fe, Co, Ni; M'=Fe) consisting of linear chains of face shared MS_6 octahedra and isolated $M'S_4$ tetrahedra has been prepared and studied. The aluminium compounds La_3MAlS_7 (M=Mn, Fe, Co) exhibit linear chain antiferromagnetism. The magnetic behavior of other La_3MFeS_7 sulfides has been examined in detail. The magnetic susceptibility of La_3MgFeS_7 shows that tetrahedral site Fe^{3+} undergoes a transition from $S={}^5/_2$ to $S=2$ spin state around 150K. (15 refs.)

108658 Double coordination of iron in the phase Fe_xZrSe_2 ($0<x<0.25$): magnetic properties and Mossbauer characteristics. M.-A.Buhannic, A.Ahouandjinou, M.Danot, J.Rouxel (Lab. de Chimie des Solides, Nantes, France).
J. Solid State Chem. (USA), vol.49, no.1, p.77-84 (Aug. 1983). In French.
The Fe_xZrSe_2 compounds have been studied from the structural, magnetic, and Mossbauer points of view. The structure of a $Fe_{0.18}ZrSe_2$ single crystal has been refined to a final 0.067 R factor value. Iron disorderly occupies both octahedral and tetrahedral voids of the Van der Waals gap of $ZrSe_2$. The Curie constants are consistent with the Fe (II) state. Negative θ_p show that interactions are predominantly AF. For $x<0.18$, χ^{-1} tends toward zero with temperature. For $x\geq0.18$, a susceptibility maximum occurs for $T\simeq7K$. Mossbauer spectra have been fitted considering two components: a singlet (tetrahedral Fe^{II}) and a doublet (octahedral Fe^{II}) broadened by the □-Fe disorder. The Mossbauer parameters and their thermal evolution are discussed. (11 refs.)

108659 The magnetic properties of some R_5Pt_3 compounds (R=Gd, Tb, Dy, Ho). H.Gamari-Seale, A.Yazdani (NRC Demokritos, Aghia Paraskevi Attikis, Greece).
J. Magn. & Magn. Mater. (Netherlands), vol.38, no.1, p.57-60 (Aug. 1983).
The magnetic susceptibility and magnetization of the R_5Pt_3 intermetallic compounds have been studied. Gd_5Pt_3 is ferromagnetic while Tb_5Pt_3, and Ho_5Pt_32 possess rather a nonlinear magnetic structure, with strong ferromagnetic interaction and high anisotropy effects at low temperatures. (1 ref.)

108660 Local measurement of magnetisation in a gallium-substituted YIG crystal by neutron spin echo. C.Mazure-Espejo, M.Schlenker, J.Baruchel (Lab. Louis Neel, CNRS, Grenoble, France), J.P.Guigay, F.Mezei.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.66-9 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
A non-destructive local measurement of the spontaneous magnetisation M_s along the growth direction x was performed across one growth sector of a single crystal specimen of flux-grown gallium-substituted YIG through non-conventional use of neutron spin echo. The volume probed in each measurement was 7×10^{-3} mm^3. It is found that M_s increases along the growth direction; in the present special case, two different regions, with very distinct rates of increase in M_s, are clearly evidenced. (8 refs.)

108661 The magnetism of the NiAs-type solid solution $Cr_xFe_{2-x}Te_3$. P.Terzieff (Inst. of Inorganic Chem., Univ. of Vienna, Wien, Austria).
Physica B & C (Netherlands), vol.122B+C, no.1, p.43-8 (Sept. 1983).
The magnetic properties of the NiAs-type solid solution between ferromagnetic Cr_2Te_3 and paramagnetic Fe_2Te_3 are reported. The description in terms of the molecular field theory indicates the presence of competitive ferromagnetic and antiferromagnetic interactions. Alloys with compositions near Cr_2Te_3 are ferromagnetic, while those with comparable amounts of Fe and Cr are ferrimagnetic, due to the antiferromagnetic interaction between neighbouring layers normal to the hexagonal c-axis. The discontinuity of the lattice parameters, most evident for c/a, coincides with the indicated transition from ferromagnetism to ferrimagnetism. (13 refs.)

75.30D Spin waves

(see also 76.50 Spin wave resonance)

108662 Spin-wave dynamics of ferromagnets with domain walls in weak magnetic fields. A.P.Tankeev, Yu.G.Raidugin (Inst. of Metal Phys., Ural Sci. Centre, Acad. of Sci., Sverdlovsk, USSR).
Fiz. Met. & Metalloved. (USSR), vol.56, no.1, p.30-40 (July 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A calculation is reported of the spectrum and amplitude of linear spin excitations of magnetically uniaxial ferromagnets with domain walls subjected to weak magnetic field. The results obtained are used to calculate the temperature dependence of the initial (reversible) magnetic susceptibility. It is shown that the main contribution to this dependence is due to states in a continuous spectrum and it is these states that determine the linear nature of the dependence. (13 refs.) *A.T.*

108663 On an anomalous behaviour of spin-wave stiffness constant in amorphous ferromagnets. T.Kaneyoshi (Dept. of Phys., Nagoya Univ., Nagoya, Japan).
Phys. Status Solidi b (Germany), vol.118, no.2, p.751-5 (1 Aug. 1983).
For the anomalous behaviour of the spin-wave stiffness constant observed in some amorphous ferromagnets, changing with the applied field, a model is suggested and discussed. (7 refs.)

108664 Magnetic excitations in Mn_3Si. S.Tomiyoshi (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan), S.Funahashi, Y.Yamaguchi.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.143-6 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Magnetic excitations in an incommensurate antiferromagnet Mn_3Si with the Neel temperature of 25.8K were measured by inelastic neutron scattering. A 10K two sharp peaks of the magnetic excitations originating from the satellite positions were observed at and energy of 1.5 meV. The width of the peaks becomes broader with increasing energy and at 2.5 MeV two peaks separated by the zone boundary combine to form a single peak with trapezoidal shape centered at the zone boundary. The width of the flat peak continues to increase with energy. Above T_N a broad peak was observed at the zone boundary at 1.5 meV. These results resemble in many respects those found in chromium, suggesting that Mn_3Si is an itinerant antiferromagnet similar to chromium. (8 refs.)

108665 Small angle elastic and inelastic neutron scattering in $Fe_{0.7}Al_{0.3}$. K.Motoya, S.M.Shapiro (Brookhaven Nat. Lab., Upton, NY, USA), Y.Muraoka.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.147-51 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Small angle elastic and high resolution inelastic neutron scattering measurements were performed on a single crystal of ordered $Fe_{0.7}Al_{0.3}$. The small angle scattering intensity drops rapidly above T_c and a peak appears at lower temperatures whose position shifts with Q. Thermal hysteresis effects observed in the small angle scattering below 300K suggests a slow relaxation motion of magnetic clusters in the ferromagnetic phase. Around 300K, well-defined spin-wave scattering is observed which follows an $E=DQ^2$ dispersion relation with $D=17$ meV Å^2. As the temperature is lowered, the spin-wave peaks fade into a quasielastic central component. An unusual property in the lower temperature region of the ferromagnetic phase was also found in the Q dependence of small angle scattering behavior. (9 refs.)

108666 Soft-mode behaviour of magnetic excitations in praseodymium under uniaxial stress. K.A.McEwen, W.G.Stirling, C.Vettier (Inst. Laue-Langevin, Grenoble, France).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.152-5 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Neutron inelastic scattering techniques have revealed a pronounced 'soft-mode' behaviour of the magnetic excitations in single-crystal praseodymium under uniaxial stress. The temperature and stress dependence of the excitations is discussed in detail. Excitations have been observed in both the paramagnetic and the sinusoidally-modulated magnetically-ordered phases. (9 refs.)

108667 Spin waves in a single-domain γ-Mn (10% Fe) alloy. K.Mikke, J.Jankowska, E.Jaworska (Inst. of Nuclear Res., Swierk, Poland).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.156-8 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Spin waves were measured over a wide energy range in single-domain γ-Mn-Fe FCT antiferromagnetic alloys. Both the energy gap in the spin wave spectrum and the magnon velocity are not much different from those in FCC γ-Mn-Fe alloys. (3 refs.)

108668 A neutron study of the magnetic excitations in CeBi. J.Rossat-Mignod (DRF/DN, CEN, Grenoble, France), D.Delacote, J.M.Effantin, C.Vettier, O.Vogt.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.163-6 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Magnetic excitations in CeBi have been measured at $T=4$K along the $[q00]$ and $[qq0]$ directions. The results reveal a very weak coupling between (001) planes and indicate that the energy is lower at the zone boundary when the excitations propagate within the (001) plane. Such a behaviour cannot be accounted for even by a bilinear anisotropic exchange Hamiltonian. (7 refs.)

108669 Magnon measurements on a γ-$Mn_{90}Cu_{10}$ single crystal. M.C.K.Wiltshire (Dept. of Solid State Phys., Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia), M.M.Elcombe.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.167-9 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Inelastic neutron scattering measurements of magnons in antiferromagnetic γ-MnCu (90% Mn) are reported for energy transfers up to 8 THz. The data are analysed in terms of a magnon dispersion relation $\omega_q=(C^2q^2+D^2)^{1/2}$ that is heavily damped with wave vector dependent damping $\Gamma(q)=\Gamma_0+\Gamma_1 q$. The authors estimate from fits of the data that $C=39.8\pm0.7$ THz Å and $D=2.3\pm0.1$ THz, and compare these values with the results of other experiments. The linear dependence of the damping on wave vector is found to give a reasonable description of the data, in accordance with theoretical expectations. (9 refs.)

108670 Order-disorder transition and spin waves in Ni_3Mn. P.v.Blanckenhagen, C.Lin, B.Hennion, M.Hennion (Inst. fur Angewandte Kernphys., Kernforschungszentrum, Karlsruhe, Germany).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.170-2 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The spin-wave dispersion has been investigated by inelastic neutron scattering on Ni_3Mn single crystals with different degrees of atomic order. Due to the transition from the ordered to the disordered state the stiffness constant decreased by a factor of about 5. (11 refs.)

108671 Line width of magnetic excitations in the Cubic Laves-phase compounds $PrNi_2$, $PrAl_2$. V.L.Aksenov, E.A.Goremychkin (Joint Inst. for Nuclear Res., Dubna, USSR), T.Frauenheim.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.176-9 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The temperature dependence of the line width of magnetic excitons in the intermetallic rare-earth compounds $PrNi_2$ and $PrAl_2$ is studied with the help of neutron inelastic scattering. Experimental results are discussed on the basis of the s-f exchange model. (7 refs.)

108672 Magnetic excitations in the dilute one-dimensional Ising-like antiferromagnet. S.E.Nagler (AECL, Chalk River Nuclear Labs., Chalk River, Ontario, Canada), W.J.L.Buyers, R.L.Armstrong, D.J.Lockwood, R.A.Ritchie.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.183-6 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Inelastic neutron scattering experiments have been performed on the randomly dilute $S=1/2$ quasi one-dimensional Ising-like antiferromagnet $CsCo_xMg_{1-x}Cl_3$ with $x=0.83\pm0.01$. The usual spin wave response around $\omega\approx2J$ was observed with a zone boundary frequency of 3.14 ± 0.08 THz. In addition, a new band of excitations was found near $\omega\approx J$. This was observed as a broad dispersionless feature centred at a frequency of 1.64 ± 0.15 THz at 4.7K. The excitations can be associated with the spins at the ends of isolated finite chains of magnetic ions. Exact calculations of $S^{xx}(Q,\omega)$ have been made for open ended chains of up to 8 spins. These can account for the appearance of the new band observed by neutron scattering. (9 refs.)

108673 Anomalous spin correlation in a linear-chain triangular lattice antiferromagnet $CsVCl_3$. K.Hirakawa, H.Kadowaki, K.Ubokoshi (Inst. for Solid State Phys., Univ. of Tokyo, Minato-ku, Japan).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.187-9 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The authors have demonstrated that $CsVCl_3$ is a very good realization of spin 3/2, 1D Heisenberg antiferromagnetic system with $J'/J=2.7\times10^{-4}$ through the inelastic scattering of neutrons. In this substance, the antiferromagnetic coupling in the basal triangular lattice plane causes a frustration effect. They have observed certain 'mysterious' properties. For instance, the excitation spectra in the plane are difficult to explain by the simple spin wave theory. (6 refs.)

108674 Magnetic excitations in two-dimensional antiferromagnets $Rb_2Co_cNi_{1-c}F_4$. H.Ikeda, Y.Someya, Y.Endoh, Y.Noda, F.Shibata (Dept. of Phys., Ochanomizu Univ., Tokyo, Japan).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.193-6 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Results of an investigation of the magnetic excitations in randomly mixed antiferromagnets $Rb_2Co_cNi_{1-c}F_4$ by means of neutron scattering are presented. Two bands of excitations are observed over a whole Brillouin zone. In $Rb_2Co_{0.5}Ni_{0.5}F_4$, a simple Ising cluster model using pure crystal exchange and anisotropy constants is found to fail in predicting the measured zone-boundary excitations. A considerable reduction of the exchange parameters in the mixed system yields satisfactory agreement between experimental and calculated spin-wave dispersion relations. A discussion is also given on the calculation of concentration dependence of the Neel temperature. (9 refs.)

108675 Solitons in the one-dimensional easy-plane ferromagnet. H.J.Mikeska (Inst. fur Theoretische Phys., Univ. Hannover, Hannover, Germany).
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.235-40 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The author presents theoretical results on nonlinear excitations in the one-dimensional easy-plane ferromagnet in a symmetry breaking external field. Soliton-like solutions to the nonlinear classical equations of motion for the real magnetic chain (as opposed to an idealized planar chain, equivalent to a sine-Gordon system) are discussed and the approach of the soliton instability in this system is described. Quantum mechanical corrections to the soliton energy in the real magnetic chain are given and shown to be substantially different from result derived in the sine-Gordon approximation. The status of quantitative predictions for the strength of contributions to the dynamic structure factor from nonlinear modes in thermal equilibrium and the investigation of these modes by neutron scattering is discussed. (14 refs.)

108676 Soliton dynamics in the one-dimensional antiferromagnet TMMC $[(CD_3)_4NMnCl_3]$. J.P.Boucher, L.P.Regnault, J.Rossat-Mignod (CENG, Grenoble, France), J.P.Renard, J.Bouillot, W.G.Stirling, F.Mezei.
Physica B & C (Netherlands), vol.120B+C, no.1-3, p.241-9 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
Recently the concept of solitons has been successfully applied to magnetic chains where magnetic solitons can be viewed as travelling domain walls. The one-dimensional antiferromagnetic compound $(CD_3)_4NMnCl_3$ (TMMC) in a transverse field is shown to be a very good realisation of sine-Gordon chains, below $T\simeq5$K. A review of recent experiments, both nuclear magnetic resonance and neutron diffraction, is given for this compound. New results are presented: the fluctuations associated with the solitons themselves have been observed for the first time; the magnon width gives direct evidence of the phase coupling mechanism between solitons and magnons. It is shown also that neutron spin echo measurements offer a promising way to study such narrow central peaks. The soliton dynamics in such real sine-Gordon chains is of fundamental importance. In very pure crystals the solitons move coherently while in samples containing a small amount of magnetic impurities in the chain, the solitons behave diffusively. (15 refs.)

108677 Inelastic neutron scattering studies of nonlinear excitations in the 1D ferromagnet $CsNiF_3$ with an external field. M.Steiner, K.Kakurai (Hahn-Meitner-Inst. fur Kernforschung GmbH, Berlin, Germany), J.K.Kjems. *Physica B & C (Netherlands)*, vol.120B+C, no.1-3, p.250-4 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
The authors' inelastic neutron scattering study of the planar 1D ferromagnet $CsNiF_3$ in an applied field has been extended. The presence of a central component in $S(q,\omega)$ is confirmed and quite different responses are found for the different spin components, $S^{\alpha\alpha}$, ($\alpha=x$, y, z). The relative strengths of these components have been determined through combinations of measurements with different orientations of the field and the momentum transfer relative to the crystal axes. The analyses show that both two-spin-wave and soliton-like excitations may contribute to the longitudinal central response, relative to the field, whereas the transverse response only has contributions from the solitons. (10 refs.)

108678 Reflection and transmission of magnons through an exchange-coupled biferromagnetic interface. A.Yaniv (Dept. of Phys. & Astron., Tel Aviv Univ., Ramat Aviv, Tel Aviv, Israel).
Phys. Rev. B (USA), vol.28, no.3, p.1613-17 (1 Aug. 1983).
The transmission and reflection of magnons from an exchange-coupled biferromagnetic interface is analyzed for both normal and off-normal incidence. It is shown that a measurement of the transmission coefficient determines, almost uniquely, the value of the interface exchange constant. (6 refs.)

108679 Spectrum of magnetostatic waves for two ferrite films with arbitrary magnetization. A.S.Beregov, V.G.Oblamskii (Kiev Polytech. Inst., Kiev, Ukrainian SSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.11, p.967-9 (Nov. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.11, p.1345-8 (Nov. 1982). [received: Sept. 1983]
The dispersion characteristics of surface and volume magnetostatic waves (MSW) for two ferromagnetic films with arbitrary orientation of external magnetic field are analyzed. The limiting frequencies for all types of MSW are obtained and the spectrum of volume MSW is studied. (7 refs.)
